Westinghouse

Air Compressors

Steam, Motor and Belt Driven

Steam Driven
Compressor

WE have been developing and building air compressors since 1869, and, while originally intended exclusively for railroad use, their simple design, absolute reliability in action, durability and low maintenance cost, so admirably suited them for a wide range of industrial purposes that the demand, outside of railroad work, became so great, we were constrained to recognize it as an important branch of our business.

We make steam driven, motor driven and belt driven compressors adapted to every industrial use. Let us send you our special publication on air compressor, No. 9012. It illustrates and describes our compressors and their application, and contains many tables of practical value to users of compressed air.

“Dominion” Wire Rope

“The Rope of Quality.”

The Quality of a wire rope depends upon the class of wire used in its construction and the way this wire is stranded together. All our ropes are made from the best quality of imported wire, specially drawn to our own specifications. Our years of experience enables us to specially prepare wire ropes for every possible rope condition, which will give the very best results and will suit the most severe tests.

**Wire Rope of every description for Elevators,
Mines, Coal Hoists, Ore Hoists, Conveyors,
Derricks, Steam Shovels, Dredges, Logging,
Ballast Unloaders, Etc.**

We have all sizes in stock, supplied in all lengths. Special rope made to order.

Blocks, Clips, Thimbles, Hooks, Turnbuckles, Etc.

NOTE

Heavy Column

Large Bearing of
Arm on Column

Central Thrust
Feature

General Strength
and Rigidity

6 ft. 0 in. Central Thrust, Motor-Driven, Radial Drilling Machine with Universal Tilting Table

SLEEVE carrying arm is of large diameter, accurately fitted to standard, and has well extended bearings (greater than radius of machine), minimizing lift and ensuring greater rigidity. The sleeve can be easily and quickly revolved by hand upon ball and roller bearings, yet has powerful locking arrangement.

ARM upon which spindle slide travels is of new improved patented form and very strong construction, and so formed as to eliminate twisting strains, and give the greatest efficiency to the machine. The part bearing upon sleeve is of great length. The portion of the arm in which spindle slide works is of box girder type, the walls of which are of strong section and well ribbed to resist lifting stresses. The spindle works midway between the two long walls of the arm, ensuring central thrust, and entirely eliminating side-twisting strains. The lifting stresses consequent upon heavy drilling are by our improved arrangement distributed over a large flat horizontal area, and come entirely on the underside of arm walls, which are of great depth, even at extremity. Lifting strains are thus brought to bear against a form of casting best calculated to overcome them, and reduced to such a minimum as to be practically negligible. No other form of arm and slide can confer these advantages.

ATLANTIC STEAM SHOVELS

CLASSY 45-16 $\frac{1}{2}$ ATLANTIC SHOVEL.

ECONOMY IN OPERATION

Reduction in friction and boiler losses, with corresponding increase in pull at dipper, is the reason why the Atlantic shovel digs more at less cost than shovels of the chain type.

Wire rope hoist, found only in the Atlantic, exerts a direct pull on the dipper and substitutes friction of a rope with but one large sheave for that of a chain with from four to six additional small sheaves. The less power lost in the machine itself, the more you have left for digging.

Further economy in operation is secured by using a large boiler of the locomotive type, in which more of the heat is utilized and less is lost up the stack. This is possible only because of the removal of the hoisting engines from their usual position on the car body, to the boom.

The placing of the main hoisting engines at the foot of the boom reduces the power necessary for swinging the boom and removes the twist upon the car body when working on one side. With this construction the turntable centre and boom foot constitute the engine frame. One casting takes the place of four or more in the usual construction, reducing the total weight of the shovel, and the weight on the front trucks.

Spare parts are kept on hand at our Works at Longue Pointe, Montreal, Canada. Every part is made to gauges, and sure to fit.

Railway Motor Cars

For Emergency Service

With a Fairbanks-Morse Motor Car, in your equipment, it is possible to start out a gang of men on an instant's notice.

They are also valuable for use on regular section work, increasing the territory covered by each gang with a saving in time and energy. Your men start to work fresh and do a hard day's work, for they can ride home without any further effort on their part.

Twenty minutes daily will keep the Fairbanks-Morse Gasoline Engine in first-class condition. Send for descriptive bulletin.

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	-	-	-	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	-	-	-	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	-	-	-	9.40 p.m.	Daily.
Leave North Toronto	-	-	-	10.00 p.m.	Will Stop at Westmount.

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ¶ The roadbed has been improved till it is unexcelled in Canada.
- ¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

For Sleeping Car Space, Tickets, etc., Apply—

PIECE WORK PRICE SETTING AT THE C.P.R. ANGUS SHOPS.

By FREDERICK H. MOODY.

Scientific management—what does it mean? This is a question constantly recurring in every line of endeavor, modern conditions of keen competition making it absolutely imperative that production costs be reduced to a minimum. Judging by the number of times the subject has been broached to the writer on the occasion of his visits to different shops in both Canada and the United States, the question is becoming one of most vital importance, holding the attention of both management and employe—both looking upon it from a different angle, and, in a great many cases, both have the wrong angular viewpoint, attempting to establish a line of reasoning from a single instance instead of from a chain of established facts.

Railway shops are among the most interested of the many investigators of the principles of scientific management. For several years the C.P.R. management, which has always been well in the van in experimental work, had been trying to improve its methods of shop production, the attempts being entirely by its own local men, and consequently savoring of the systems previously in use at the shops. It was, therefore, decided that it would be advisable to bring in experts to analyse conditions and prescribe the necessary remedies for rectifying conditions.

In June, 1909, Dodge, Day and Zimmerman, of Philadelphia, Pa., a firm of "industrial doctors" or contracting engineers, were called in to make a report on the plant, their particular duties being to analyse the plant and its equipment and make suggestions where conditions might be advantageously improved. This firm requisitioned the services of H. L. Gantt, industrial engineer, who made a report on the plant. His suggestions, however, were more general than particular, striking at the underlying principles rather than at concrete examples of where work might be improved. Among his suggestions were recommendations for an adherence to standard forms for cutting tools and a partial rearrangement of the shops with respect to the installation of a schedule system for the directing of the product through the plant and a reorganization of the piece work department.

Following the completion of Dodge, Day and Zimmerman's report, Mr. Gantt's services were retained by the C.P.R. for upwards of a year in the capacity of a consulting engineer. The most important of the suggestions he offered during this period was that of adapting the Taylor system of instruction cards for piece work pricing. This suggestion was followed, with the exception that the system in its entirety was not introduced, various modifications being made to meet the local conditions existing at the works. These conditions are necessarily different from any for

which the Taylor system was originally planned, as in such a plant as the Angus shops, not only is new work handled, but also a lot of repair work, and work that will never be duplicated or produced in large quantities.

THE SYSTEM.

The system, as originally introduced, has been still further modified from time to time with the idea of bringing it more nearly to a state of perfection. With the guidance of Warren B. Hood, General Shop Inspector, under whose direction this piece work rate setting comes, and by whose efforts the system has been made to prosper, most satisfactory results have been obtained.

P245

J. M. R. Fairbairn,

Assistant Chief Engineer, Canadian Pacific Railway
Eastern Lines.

As demonstrative of the operation of the system, consider a specific case. One of the department foremen desires to have a piece-work price set for the operation of drilling the cylinder and casing stud holes in the front cylinder cover. The foreman fills in the blank shown in fig. 1, which is addressed to the Chief Piece Work Inspector, this form giving date, name of part, details of necessary operations, list number, drawing number, classes of engines on which this same operation is necessary, machine number, engine number (if special piece), number of pieces, store order, material, operator's name and rate, and remarks. This latter usually calls for two

separate prices, the price for the first piece, which includes setting up the machine, and a price for all subsequent pieces.

In the locomotive machine shop there are two shop demonstrators whose duty it is to set the price. It is at this point that the system differs essentially from many methods of setting piece-work prices, actual practice under normal conditions being those selected for a basis of computing the price allowance. This is in marked contradistinction to arbitrary, theoretical price-setting as followed in many places.

To one of these shop demonstrators, the foreman's requisition for piece-work price is given by the shop inspector. As will be noted on the requisition form, fig. 1, the foreman states the machine on which he desires the piece to be produced, and the mechanic to operate that machine. This is all the information on which the shop demonstrator has to work. Following the receipt of his notification, an actual demonstration on this piece is performed on the machine defined, the operator doing the work himself. The duty of the shop demonstrator is to bring in any refinements of operation that will increase the rapidity of production. He works with the men, but does not do the work for them.

The machine being in readiness, the shop demonstrator observes the operator set up the machine for the necessary operation. During this setting up, the shop demonstrator makes such suggestions as his experience dictates. The time of this operation is kept. The time of setting up the piece preparatory to drilling is noted, as is also the time of drilling the holes. Meanwhile, the shop demonstrator makes suggestions relative to the tool to use, feed, and spindle speed the operator being required to follow the instructions given. As previously mentioned, all the actual work is performed by the operator, the shop demonstrator merely making suggestions and timing. Several such tests are made, the duration of the different operations being noted in each case. These notations are made on an instruction card somewhat similar to the one, the front and reverse sides of which are shown in figs. 3 and 4. In the card as made up in the shop the sketch and data are roughly pencilled in.

Referring to fig. 4, it will be noted that the actual operating time, exclusive of preparations, is 27 minutes, or 0.45 hour. This being for one man only, gives a time of 0.45 man-hours per piece. The total time, including time of preparing machine, is 42 minutes, or 0.70 hour. These are actual times.

It stands to reason, however, that an operator could not keep up this demonstration speed for 10 hours every day, as this period is actual operating time, under normally good conditions, no allowance being made for the usual run

of minor mishaps. Where a mishap does occur while a job is being performed, that demonstration is not considered; only good performances are kept for price setting. This basis is taken so as to produce an absolutely fair basis of computation.

The question of making an equitable allowance for minor casualties absorbed the attention of the organizers of this system for some time after its institution. At first, a straight 25% of the actual demonstrations operating time was added to give the pay equivalent al-

lowance, or actual time allowed the operator to produce the piece, this 25% being the allowance for all casualties. It was found after the system had been operating some little time, that this did not give a fair basis of reimbursement for lost time. For some operations it was too great an allowance, but in the majority of cases this amount was not sufficiently large. For the most part, the allowance has had to be increased. This introduced a more complicated condition—the scheduling of different allowances for different classes of work.

period working at the original demonstration rate. The difference gave the basis for making the allowances. These tests, being made for a great number of cases covering all conditions, gave sufficient points from which straight line allowance curves could be plotted, the abscissas representing operations per hour and the ordinates, percentage allowances. Parallel diagonal lines on this field represent pieces per hour. These curves give a ready means of computing for nearly all conditions.

Coming back to the case in hand, and

at any one of the small machine shops at the roundhouses throughout the system—printed copies are made up in batches of 25, 50 or 100, as desired, for widespread distribution. An apprentice makes all the necessary sketches for the zinc cuts, this having the advantage of giving the apprentice good draughting experience.

These instruction cards, as they are called, form the basis of the piece-work system. They are preserved as a permanent record for all future reference purposes. The advantages of having

lowance, or actual time allowed the operator to produce the piece, this 25% being the allowance for all casualties. It was found after the system had been operating some little time, that this did not give a fair basis of reimbursement for lost time. For some operations it was too great an allowance, but in the majority of cases this amount was not sufficiently large. For the most part, the allowance has had to be increased.

This introduced a more complicated condition—the scheduling of different allowances for different classes of work.

referring to fig. 3 again, it will be noticed that the actual demonstration time was 0.45 hour. For these conditions from the allowance curves the addition to be made was found to be 30%, which is 0.13 hour, or a total pay equivalent time for each piece of 0.58 hour. For the first piece, which includes setting up, the same allowance of 0.13 hour is made, which, added to the 0.70 hour demonstration time, gives 0.83 hour as the pay equivalent. This card, figs. 3 and 4, gives all the detailed instructions of the job, no reference being made to

such a collection of instruction cards are manifold. What is probably the most important function from a repair shop standpoint, is the fact that the exact period of time required to produce being known, the locomotive on which repairs are being made can be promised with a much greater certainty of delivery on the scheduled date, and confusion is largely eliminated.

This system has a further advantage in encouraging the foremen to better performances in their respective departments, each foreman being held respon-

B D ANGUS SHOP C. P. R.

Fig. 4. Reverse Side of Instruction Card.

It was realized that an operator's dexterity and skilfulness on a job increased in proportion to the way in which the number of pieces and number of operations increased. Consequently, more allowance had to be made for the failure of the human factor under long-continued periods of working. Hence, as the number of operations per hour increased, a greater allowance was given to the actual time to determine the rate on which to set the pay.

The method of determining these differences for all conditions is most interesting and instructive, but is too elaborate a scheme to be considered in detail. Briefly, actual test conditions were experimented upon, the actual production for a ten-hour day being compared with that figured for a similar

price, all calculations being based on time, making a permanent record for future reference.

INSTRUCTION CARDS.

Up to this point, however, the card, figs. 3 and 4, is in rough pencil form with freehand sketch, as left by the shop demonstrator. When filled in to this point it is handed over to the general shop inspector. If the piece should be a cylinder or similar job that could only be machined at the Angus or Winnipeg shops, only three or four typewritten copies would be made up for distribution to the interested foremen and superintendents at these two points. Where the piece to be machined is small, such as the cylinder cover under consideration—a piece that might be made

sible for all irregularities that occur in the carrying out of the schedule. It has been found an excellent incentive towards increased production.

From the workman's standpoint it is a system to be commended. It is not a slave-driving system like many piece-work plans, but, instead, co-operates with the man, showing him how to produce the maximum possible output, with a minimum of labor. It is for this reason that the positions of shop demonstrators are maintained. These men, experts in machine shop production, know how any machine can be made to operate to the best advantage, selecting the best tools for the purpose, as noted on the shop instruction sheet, and at the same time giving the man suggestions that will enable him to increase his out-

put. It will be noticed that the system is aimed more at working the machines to their best advantage with a resulting saving in the exertion of the workman, and his consequent improved condition to maintain his efficiency throughout the full day. Where a man fails to keep up to the standard set, the foreman knows at once that something must be wrong with the manner in which the operations are being performed, and therefore requisitions the services of the

ducting the time of setting up, etc., incidental to the first piece. These piece work price cards, like the shop instruction sheets, are filed for checking the men's time slips.

This, briefly, is the piece work price setting system in operation at the C.P.R. Angus shops. It is a system to be highly commended, and reflects credit on the organizers. To many it may appear theoretical and unpractical, and to some of the men in the shop it will

of hydraulic pipe, built up as indicated. Cupped leather packing on the piston attached to the lower end of rod A maintains a tight joint when air is introduced under the piston through the pipe on one side. The lower support is on the piece of jointed pipe C. A set of these pieces is kept in stock for use on jobs requiring different lengths between flooring and surface to be rivetted.

The tool is carried on a cross arm D in a crosshead slide arrangement. This

shop demonstrator to watch the operator and discover wherein the fault lies. The shop demonstrator can thus make the necessary suggestions to bring the article being produced up to the standard predetermined time period. It can thus be seen that the system is in the best interests of both employer and employee.

As mentioned, standard tools are employed, these tools being noted on the shop instruction cards. The shapes of tools are those laid down by Frederick W. Taylor in Dec., 1906, in the wonderful paper "On the Art of Cutting Metals," presented as his address when retiring from the presidency of the American Society of Mechanical Engineers. Tools best adapted for all conditions were treated by him in that address, the tools being designated by various combinations of letters. These tools were the result of years of experimental work on metal working at the plant of the Bethlehem Steel Co., of which he was Chief Engineer. A specialty of this work is being developed by the Tabor Mfg. Co., Philadelphia. At the Angus shops, cast iron models of the tools have been made up for distribution to the different tool grinders who put the tools in shape for the workmen. Standard tools are thus available at all times, making duplication of original operating conditions readily possible.

After the shop demonstrators have set their figure for the piece for which the original piece work price request slip, fig. 1, had been issued, the essential information regarding the results of the price setting performance is jotted down on the reverse side of the piece work request slip, as in fig. 2. This, on being checked by the shop demonstrator, is returned to the foreman, requesting the piece work price, for his signature, thereby signifying that he considers the price set and conditions to be quite equitable.

PIECE WORK PRICE CARDS.

After the shop instruction sheets have been made up the piece work price setter adds his contribution to the steps of the system by making out price cards such as those shown in figs. 5 and 6. Both cards refer to the same piece, the one in fig. 5 referring to the first piece of a batch only, while that in fig. 6 is based on the time required after de-

possibly savor too much of anti-unionism, but "the proof of the pudding is in the eating," and as the "eating" in this case has proved manifestly pleasant, it would appear to be a material advance on the majority of systems of price setting.

is made up of a ball piece E attached to the tool and which is constrained to move in the correspondingly formed ways F, allowing a wide latitude of positions for the tool in operation. In order that the movement may be even freer, the guide carrying part C of the arm is

Pneumatic Tool Holder used by Pere Marquette Rd.

Pneumatic Tool Holder Used by the Pere Marquette Rd.

For the convenient handling of the pneumatic hammer in awkward places and also for use in general, the tool holder shown in the accompanying illustration, was designed. The stand consists of a rod A, cupped at its upper end to fit over a rivet head, and having a small air cylinder B at the lower end. The shell of this cylinder is constructed

slidably connected in a piece of piping as indicated, thereby permitting a radial movement of several inches. A slotted pin connection between upright and cross arm, leaves the latter free to swing through a small arc as desired.

J. D. Altimas, Car Accountant, C.P.R., Montreal, read a paper on Car Accounting at the regular monthly meeting of the Canadian Accountants Association in Montreal, Nov. 13.

Tests of C.P.R. Experimental Mallet Locomotive.

In the Aug., 1909, issue of The Railway and Marine World, a brief description of the experimental Mallet locomotive 1950, then being constructed by the C.P.R. at its Angus Shops, was given. A complete, detailed description, accompanied by the results of a series of tests, was contained in the Apr., 1910, number. These tests covered all phases of the

and feed water heater. The steam generating section and feed water heater are similar in construction, with an intervening box structure for downward projecting superheater tubes, the hot gases passing in succession through the three sections to the smoke box.

The original tests referred to in the previously published article were made between Hochelaga, Angus, and Mile End, in Montreal, where there is a maximum gradient of 1.5. To test the locomotive more fully under actual operat-

The 17½-mile section, representing a heavy gradient, all the way, is chosen as representing the operation of the locomotive under conditions for which it was designed. The next section from a mile and a half east of Redgrove to 2½ miles west of Golden is a practically level stretch. These two runs afford a very interesting comparison. On the gradient, of course, the highest tractive effort is developed with a resulting decrease in speed. Just the reverse is the case on the level, where a very low

Graphical Results of Tests on C.P.R. Experimental Mallet Locomotive 1950.

locomotive operation, and led to a number of minor changes in design, which could be embodied in that locomotive without too much re-modelling.

This locomotive was designed for pusher service in the mountain portions of the British Columbia Division, and for those who have not the previous description at hand, the following principal dimensions are given:—

Tractive power 57,400 lbs.
Weight on drivers 262,000 lbs.
Total weight 262,000 lbs.
Weight of locomotive and tender 391,000 lbs.
Wheel base of each engine 10 ft. 4 ins.
Total engine wheel base 35 ft. 2 ins.
H. P. cylinders 23¼ x 26 ins.
L. P. cylinders 34 x 26 ins.

Briefly, the principal difference between this and the usual type of Mallet locomotive lies in the fact that the cylinders of the front truck are at the rear, bringing high and low pressure cylinders into close proximity. Leading and trailing pilot wheels are dispensed with. The boiler barrel is divided into three principal sections: steam generating section, superheater

ing conditions on the class of traffic and location for which it was built, another series of tests was planned and carried out towards the middle of 1910. The section selected was the 130-mile stretch from Field to Revelstoke, B.C., in the heart of the mountains, this section taking in the Rogers Pass, where gradients as heavy as 2.45 are to be found.

Four tests were made: May 28, 1910, Revelstoke to Field; May 29, 1910, Golden to Rogers Pass; June 1, 1910, Revelstoke to Field, and June 2, 1910, Beavermouth to Rogers Pass. Of these first two tests, representative sections have been selected and are shown in the accompanying charts, where the results of the tests covering the more salient observations are embodied in readily understood curves.

On the May 28 test, from Revelstoke to Golden, the locomotive was operating with the following load: equivalent tons, 663; contents, 370; tare, 283; loaded cars, 15; and empties, 2. The first two sections shown in the chart are taken from the stretch under these conditions.

tractive effort is produced with a much higher speed.

The third section, from near Beavermouth to 2½ miles east of Rogers Pass, was taken on a run in the opposite direction, the second day of the tests, May 29, 1910. The conditions were: equivalent tons, 724; contents, 338; tare, 366; loaded cars, 19; and empties, 2. Like the first section, it represents a heavy gradient and demonstrates the qualities of the locomotive under such conditions.

In the original tests, it was found that the high and low pressure cylinders did not do equal work, so, in order to equalize the power, the diameter of the low cylinder was increased, making the ratio of cylinders 2.38. The wisdom of this is demonstrated in these present tests where it will be noticed that under grade load the work is very evenly divided.

Many interesting facts may be derived from a study of this series of curves. Unfortunately, lack of space precludes the possibility of giving all the tests, or even one complete test, but it is be-

lieved the best are shown in the three sections selected, which represent a distance of over 50 miles, or about half the length of run of the longer tests.

No observations were taken on the down grades on the run, as they are all so steep as to make the application of power unnecessary, it being possible to coast all the way.

Steel-Frame Parlor-Cafe Cars for Temiskaming and Northern Ontario Railway.

To meet the demand for more equipment of the "extra fare" class, the T. and N.O.R. Commission ordered from the Canadian Car and Foundry Co., in Aug., 1910, as mentioned in our rolling stock notes at the time, three parlor-cafe cars of the latest design. One of the finished cars and a floor plan are shown in figs. 1 and 2 respectively. They have been given the names of Sesekinika, Wasaksina and Tetapaga, and were delivered a short time ago.

These cars embody some interesting departures from the practice followed in the past by builders of passenger cars in Canada, as the trucks, deck and framing of the superstructures are made up of structural shapes. A general idea of this construction is given by the illustration, fig. 3, of the car skeleton before being sheathed.

The cars have the following principal dimensions: length over end sills, 70 ft. 3½ ins.; length over platform, 80 ft.

x ½ ins. top and bottom cover plates having cast-steel connecting webs at the outer end. These diaphragms, with cross ties, hold the centre and side sills together as a solid unit.

The superstructure framing has a plate girder 35 ins. deep placed inside of posts, consisting of a 34 x 3-16 web

shown, is composed almost exclusively of structural shapes, and is of a very solid construction. The pedestals are special, and are steel castings containing 3-coil 8 x 12½ ins. springs. The elliptic bolster springs are 36 in. centres, and contain 9 ply. Triple high-speed brakes are equipped, attached to a spe-

Fig. 1. One of the Steel-Frame Parlor Cafe Cars for T. and N.O. Ry.

plate with a 3 x ¾ bar forming top chord, the previously mentioned angle side sill forming the bottom chord. The posts are 5 x 3 x 5-16 and 3 x 3 x 5-16 angles located as indicated. These are rivetted both to side sill and plate gir-

der. The corner posts consist of 6-in. 8-lb. channels, and the end posts, 4-in. 7¼-lb. channels, all rivetted to the end plate, composed of a 4-in. 7¼-lb. channel with a 3 x 3 x 5-16 channel rivetted thereto. This construction is calculated to be anti-telescoping.

TRUCKS.—Pennsylvania standard six-wheel all-steel trucks, with a capacity of 80,000 lbs., are used, the construction being pretty clearly shown in fig. 4. These trucks have a wheel base of 11 ft. The wheels are 36 ins. diam., Schoen rolled steel, mounted on open hearth axles having 5 x 9 journals. The journal boxes are M.C.B. standard, with Harrison dust guards.

Fig. 2. Floor Plan of Parlor-Cafe Cars for T. and N.O. Ry.

3½ ins.; width over side frame, 9 ft. 9½ in.; width over eaves, 10 ft. 1½ ins.; height over roof boards, 14 ft. 1 in.; and centre to centre of trucks, 51 ft. 10 ins.

STEEL BODY FRAME.—The centre sill of the underframe is composed of two 18-in. 44-lb. channels 77 ft. long, spaced

er. The corner posts consist of 6-in. 8-lb. channels, and the end posts, 4-in. 7¼-lb. channels, all rivetted to the end plate, composed of a 4-in. 7¼-lb. channel with a 3 x 3 x 5-16 channel rivetted thereto. This construction is calculated to be anti-telescoping.

TRUCKS.—Pennsylvania standard six-

wheel all-steel trucks, with a capacity of 80,000 lbs., are used, the construction being pretty clearly shown in fig. 4. These trucks have a wheel base of 11 ft. The wheels are 36 ins. diam., Schoen rolled steel, mounted on open hearth axles having 5 x 9 journals. The journal boxes are M.C.B. standard, with Harrison dust guards.

red-pine flooring acts as floor insulation. The ceiling, except in kitchen, is of 3-16-in. Agasote. The vestibules at both ends are of the Pullman special wide type C construction, with the usual detail. The platforms contain the Standard Coupler Co.'s buffing device, and have attached

Fig. 3. Steel Body and Superstructure.

16 ins. apart, back to back, with 24 x ½ in. top and bottom cover plates extending the full length. Each side sill is composed of a 5 x 3½ x 9-16 rolled angle. The cross ties are composed of 6-in. 86-lb. rolled channels.

Located 33 ft. apart, there are two deep diaphragms, each built up of two flanged steel web plates ¾-in. thick, spaced 8½ ins. back to back, with 15

wheel all-steel trucks, with a capacity of 80,000 lbs., are used, the construction being pretty clearly shown in fig. 4. These trucks have a wheel base of 11 ft. The wheels are 36 ins. diam., Schoen rolled steel, mounted on open hearth axles having 5 x 9 journals. The journal boxes are M.C.B. standard, with Harrison dust guards.

The Pennsylvania all-steel truck as

Fig. 4. Pennsylvania Standard All-steel Truck.

friction draft gear with 2-coil 8 x 8 draft springs with a drawbar height of 35 ins.

An artistic arrangement of the parlor has been obtained in this car as shown in fig. 5. There are 6 revolving chairs, 2 wicker chairs, and 1 sofa in this part, upholstered in green plush. The sofa has a locker beneath. The revolving chairs are each provided with a foot rest and have every convenience tending

towards comfort. The parlor is 17 ft. long.

The smoking room, 7 ft. long, is provided with a sofa and a wicker chair, both upholstered in Spanish leather. This sofa also has a locker beneath. Off this room is the men's lavatory.

heating is from a Gold Car Heating Co.'s combination steam and hot water heater with a Frumveller heater having four rows of extra heavy 1½-in. pipe, the lowest one 2 ins. from the floor.

The inside finish of the car body is in plain and figured mahogany; pantry,

The mechanics find this device very convenient, not only for testing the jack's capacity, but also for use when testing the packing and joints of the jack. Any load within the capacity of the jack (and of the stand) can be very simply applied, and as readily released.

Fig. 5. Interior of Parlor.

Fig. 6. Interior of Dining Room.

The dining room, shown in fig. 6, has a length of 20 ft., and is arranged with 3 double and single tables with 18 leather upholstered mahogany chairs. These three rooms have a seating capacity of 35, 12 in parlor, 5 in smoking room and 18 in dining room.

The floor covering in parlor and dining room is of Victoria Wilton carpet, with an aisle strip of similar material. The passage-ways and smoking room have rubber tiling, with mosaic tile in the two saloons, the locations of which are indicated in the plan view.

plain mahogany; kitchen, birch-stained mahogany; vestibule, birch-stained mahogany, with mahogany doors and sash; and wainscoting, mahogany veneered. The trimmings throughout are of statuary bronze. A sufficient number of basket racks and coat hooks are provided.

The exterior is painted in the T. and N.O.R.'s standard olive-green coach body color. Striping, lettering and numbering are applied in gold leaf, the whole being covered with three coats of finishing varnish. The roof is finished in Pompeian red. The trucks are of the railway standard truck color with all other iron work in black.

Testing Hydraulic Jacks at the Intercolonial Railway Shops.

In the testing department of the I.R.C. locomotive shops at Moncton, N.B., a simple but useful and effective rig has been made for testing the standard hydraulic jacks of the type commonly found around metal working shops.

The jack to be tested, shown in the accompanying illustration, is placed on a plate A resting on a concrete foundation. From the four corners of the plate A, there are four bolts B passed through pipe sections, joining a similar piece of plate C at the top. The pipe sections act as distance pieces. A rigid, open frame is thus obtained.

Passing through the top plate C, there is a loose bolt holding up a small hydraulic press D, the plunger of which hangs downwards. Between the base of this press, and the upper plate C of the stand, there is a heavy coiled spring E of square bar stock, tending always to keep the press in its lowest position, making a resilient backing, and at the same time acting as a means for forcing home the jack plunger after its test.

The press cylinder has a pipe connection with pressure gauge attached as indicated. The area of the press plunger being known, it is a simple matter to calculate the pressure being exerted by the jack, which is placed in the position indicated, and the plunger forced upward in the usual manner.

A handy improvement to this rig would be to calibrate the gauge to record directly the total pressure on the press plunger, which is the weight being lifted by the jack. This is easily done, as the total pressure is a factor of the pressure per square inch, indicated by the gauge.

Saw for Cutting Packing Rings at C.P.R. West Toronto Roundhouse.

The accompanying illustration shows a device at the C.P.R. West Toronto roundhouse that the majority of roundhouses where compressed air is to be had would find it advantageous to copy. The device, which is self-contained, is attached to one of the roundhouse wooden columns, located between two of the tracks.

Saw for Cutting Packing Rings.

Hydraulic Jack Testing Device.

The kitchen, 8 ft. long, is well-equipped with coal range having hot water tank, charcoal boiler, air-pressure water system, copper sink, six canisters, and three bolt system refrigerators, one in kitchen, and two in pantry. The kitchen floor is covered with sheet copper.

Lighting is obtained from Pintsch gas lamps, of which there are 6 centre, 3 desk, 6 bracket, and 2 vestibule. The

A small rotary air motor A, with projecting shaft, has a saw cutter B attached as indicated. In front of this cutter, with its surface slightly lower than the air-motor centre line, there is a small table C, slotted to receive the cutter. Attached to the post above there is a saw guard to ward off the flying chips thrown out by the rapidly revolving cutter, for the motor rotates at a very high speed.

Air is piped to the motor from above, controlled by the valve D. The device is oiled the desired amount by the oil cup E, connected to the air pipe through an elbow connection, in which is a valve. The air, passing the oil cup opening at a high velocity, creates a vacuum, drawing in the oil, regulating by the valve below by the oil cup.

The piston or valve packing rings to be saved are kept in stock, as they come from the moulds uncut. They are placed on the table, and a light pressure up against the saw cuts the ring through.

An Historical Steam Hammer.

The steam hammer shown in the accompanying illustration is interesting, not from its present value which is

Historical Steam Hammer.

small, but from its historical connection. The writer came across it in the Intercolonial Ry. shops at Moncton, N.B., where it had been sent for repairs.

Fig. 2. Drop Pit Installation at St. John, N.B.

This ancient piece of machinery was manufactured by the Moir Co. of Halifax, N.S., about 34 years ago, for the I.R.C., being installed in the railway shops there. It has a 5-in. cylinder and an 18-in. stroke, with a weight of falling parts of about 175 lbs., and has a 7-in. square die block. The height over all is 7½ ft. and the floor space is 24 by 36 ins. This hammer was in service at the

Halifax shops up to a little more than a year ago, when, on the removal of the shops to a new location, it was shipped to Moncton for general repairs before being placed in service in the new shops. However, it was not considered worth the cost of repair so will doubtless come to the usual end of all tools, on the scrap heap.

What impressed the writer most forcibly was the marked similarity between present-day construction on small steam hammers, and construction as it existed upwards of 35 years ago. In almost all details, it compares very favorably with present-day practice in the construction of hammers of similar proportions. A review of the past develops some remarkable instances of the slight progress made in certain lines of construction.

Car-wheel Drop Pit on the Intercolonial Railway.

Many and varied are the kinds of drop pits to be found around locomotive and car repair shops and roundhouses.

Fig. 1. Carwheel Drop Pit on the Intercolonial Ry.

One of the latest has been installed at the I.R.C. at St. John, N.B.

Fig. 1 clearly shows the arrangement and workings of the mechanism connected with the drop pit. A table, A, built up of plate and structural shapes with end castings, carries short pieces of track, forming a unit of the through

merely a loose connection with no attaching bolts.

The actuating air cylinder is of sufficient length to give the required drop into the pit, this drop depending on the use to which the pit is to be put, and is necessarily larger in a roundhouse. The upper end, F, of the cylinder has three packing rings forming a good working joint. Air is introduced to the lower face of the plunger through a control valve on the pipe G. The normal position of the plunger is in its lowest position with the head E resting on the upper face of the cylinder.

To operate, air is introduced under the plunger, lifting it into contact with the lower surface of the table, raising the latter the amount permissible by the stop block H. Levers I, one on each side of the table, when thrown to the right, with the table in its uppermost position, draw out the struts B into their recesses. Releasing the air gently lowers the table into the pit, the plunger drawing away from the table when it reaches the bottom.

The table is in reality a small car with four wheels, J. Rails laid in the pit at right angles to the upper tracks, form a runway for the little car with its load. The car then being run to the left, clearing the locomotive or car on the upper track, may have its load, consisting of a pair of wheels, raised for repair

Fig. 3. Passage from Drop Pit, with Air Hoist.

track in the shop or roundhouse. This table is supported by four pinned struts B, one at each corner. These struts are pin-connected to pit castings C, into which they may be swung clear of the wheel table.

The lower face of the wheel table, at D, is recessed to receive a projection on the face of the head casting, E, on the end of a long air plunger. This is

purposes, or to have another pair replace them.

Figs. 2, 3 and 4 show the mechanism as applied to a pit in the I.R.C. car repair shops at St. John, N.B. In fig. 2, the workman at the wall is ready to turn on the air to lift the table against its stops while the workman to the right draws out the supporting struts from under the table. The little car when

lowered runs into the passageway over which the workmen are standing. This picture does not give a very good idea of its use, its greatest value being demonstrated when used under a car or locomotive.

The little car containing the pair of wheels passes through the aforementioned passageway into the lean to fig. 3 shown through the open door in fig. 2.

Fig. 4. Wheel Storage leading from Drop Pit Shed.

The air hoist shown in fig. 3 raises the wheels, which when twisted around, are lowered on to the standard gauge track which forms the edge of the pit.

From this point the wheels are run out on to the little car shown in fig. 4. This car runs along a narrow gauge track, with wheel storage tracks at right angles to it, making it very convenient for storing or replacing new wheels, both old and new wheels being kept separate and easy to get at.

This drop pit was invented by W. U. Appleton, Assistant to the Superintendent of Motive Power, I.R.C., Moncton, N.B., and by G. E. McCoy. The wheel pit mechanism is patented in Canada, no. 132,430, and in the United States, no. 1,002,797.

Grain Rates on the Intercolonial Railroad.

Under date of May 19, 1910, the Board of Railway Commissioners, on the application of the Montreal Board of Trade, passed the following order:—

"The rates of the G.T.R. and C.P.R. on ex-lake western grain carried from lake or river ports to points on the lines of the said companies in the provinces of Ontario and Quebec, shall be the same for equivalent distances from all lake and river ports at which facilities exist for the transshipment of the said grain from vessels to cars, between Depot Harbor and Montreal, inclusive, and shall include the cost of like services at all such ports of transshipment and at all points of destination, whenever the said cost is included in the rate or rates at one or more port or ports of transshipment, or at one or more point or points of destination; and to points off the lines of the said companies to which points joint rates are made by the addition of 'arbitraries,' the said arbitraries shall be the same on shipments from all the said ports of transshipment. On such grain transhipped at ports west of Montreal, destined to points east of Montreal to which points through rates are based on arbitraries, the western portion of the said rates shall be based on St. Henri mileage in the case of the G.T.R. and on Outremont mileage in the case of the C.P.R. The G.T.R. and C.P.R. shall give effect to this order by publishing and filing special tariffs to take effect not later than June 13."

Some time since the Montreal Board of Trade requested the Government

Railways Managing Board to apply the rates ordered by the Board of Railway Commissioners on grain ex-lake from Montreal to points in the Province of Quebec east of Levis, and which are in force on the Intercolonial Ry. as far east as Levis on account of competitive reasons. The Government Railways Managing Board having declined to grant the request, the Montreal Board

of Trade has petitioned the Minister of Railways in regard to the matter.

The petition sets forth that Parliament passed the Railway Act of 1906 for the protection of shippers and for the regulation of rates and other matters connected with railway transportation, and that practically all railways in Canada, excepting the Intercolonial, are subject to its conditions.

In the case of a shipper having a complaint against a railway other than the Intercolonial, there is an appeal to the Board of Railway Commissioners from the decision of the management of the company, the Commissioners being governed by the provisions of the Railway Act in their consideration of the complaint, while in the case of a complaint against the Intercolonial there is no appeal from the decision of the Managing Board of the Canadian Government Railways, which Board is not bound by the Act considered necessary by Parliament to safeguard the rights of the public in their dealings with railways generally.

The Intercolonial discriminates in favor of Maritime Province shippers, to the great detriment of Montreal shippers, and the best interests of all shippers would be more properly served if the Intercolonial were placed under the jurisdiction of the Railway Commission, which would result in rates being maintained on an equitable basis all over that railway.

The Intercolonial has a great number of private special rates to which the public have no access, and were the Intercolonial governed by the Railway Act these rates would have to be filed with the Railway Commission and posted at each Intercolonial Ry. office for the information of the public and thus shippers would know exactly what rates are being charged.

The Intercolonial is in competition with the C.P.R. to points such as St. John, N.B., and it seems to be an anomaly that the C.P.R. should be governed by the Railway Commissioners and the Intercolonial be free from such control.

Were the Intercolonial governed by the Railway Act, the Minister and the railway officials would be relieved from the political pressure for preferential treatment as to rates, etc., to which they are now liable.

The petition concludes by urging that the Intercolonial be placed under the Board of Railway Commissioners' jurisdiction.

Hook for Lifting Axles from Lathe at C.P.R. Angus Shops.

Of all the jobs that are constantly recurring in railway shop routine work, there are probably few that, in proportion to size, are as awkward to handle as the placing and removing of an axle in an axle lathe. The drive being im-

Hook for Lifting Axles from Axle Lathe.

mediately over the centre makes it impossible to lift the axle out directly with chain or other securing means placed at the centre or point of balance. A two-stage shifting operation is required.

A simple hook for remedying this defect has been devised at the C.P.R. Angus shops, in the tender wheel department, of which J. A. Hope is assistant foreman. As shown in the accompanying illustration, the device consists simply of a bent forked hook A, having a hooked arm B pin-connected at the middle of the horizontal portion of A. The horizontal section is made of such length that the hook and forked arm will clear the centre or drawing part of the axle lathe, gripping the axle in the manner indicated.

This hook device is quite a time saver, as the time of setting up and taking down an axle is very materially reduced by it.

C.P.R. Scholarships at McGill University

Sir Thos. G. Shaughnessy, President, C.P.R., has issued a circular stating that two free scholarships, covering four years' tuition in the Faculty of Applied Science of McGill University, are offered, subject to competitive examination, to apprentices and other employees enrolled on the company's permanent staff and under 21 years of age, and to minor sons of employees. The competitive examination, which will be the regular entrance matriculation examination, will be held at the University, Montreal, and at other centres throughout Canada, in June. The candidates making the highest average and complying with the requirements of admission will be awarded the scholarships and have the option of taking a course in any department of the Faculty of Applied Science. Scholarships will be renewed from year to year, to cover a period not exceeding four years, if, at the close of each session, the holder thereof is entitled, under the rules, to full standing in the next higher year.

Applications for certificates entitling eligible persons to enter the competition should be addressed to C. H. Buell, office of Vice President McNicoll, Montreal.

The Canadian Northern Ontario Ry. has adopted the 24 hour system for its working time tables, but the Passenger Department will continue to use a.m. and p.m. time on its folders.

Ten-Wheel Locomotives for Duluth, Winnipeg and Pacific Railway.

The Duluth, Winnipeg and Pacific Ry., a subsidiary of the Canadian Northern Ry., has recently received from the Baldwin Locomotive Works, Philadelphia, five passenger locomotives, which are equipped with fire-tube superheaters. They are of the ten-wheel type, and exert a tractive force of 28,800 lbs. The ratio of adhesion is 4.57. Although not exceptionally large for their type, they represent a highly efficient class of power, and the application of superheaters should materially increase their capacity.

The boiler is of the wagon-top type, with a long fire-box placed above the frames. The mud ring is of forged iron, and is sloped toward the front. This arrangement provides a deep throat, the distance from the top of the grates to the bottom row of tubes being $26\frac{3}{4}$ ins. The flexible staybolts number 218; they are applied in the sides, throat and back, and are placed principally in the outside rows. The crown staying is radial, and the four centre rows of bolts are provided, under the crown sheet, with pressed steel nuts and copper gaskets.

The frames are of steel, with single front rails. They are braced transversely by the guide yoke, the valve motion bearer, a broad steel tie immediately ahead of the main pedestals, and a tie under the front end of the fire-box. The front bumper and back foot plate are of cast steel. Because of the location of the fire-box, the equalization is arranged with yokes over the main and rear driving boxes and half elliptic springs between adjacent axles. At the rear, the frames are supported on full elliptic springs.

The tender is carried on two four-wheeled trucks, which have cast steel bolsters and steel-tired wheels. The frame is composed of 13-in. channels. The tank has a water bottom, and is fitted with steel coal gates. It has a capacity for 6,000 gals. of water and 10 tons of fuel.

The principal dimensions are appended:—

Cylinders		22 x 26 ins.
Valves		Balanced piston
Boiler, type		Wagon top
Boiler, material		Steel
Boiler, diameter		66 ins.
Boiler, thickness of sheets		$\frac{3}{8}$, 11-16, $\frac{3}{4}$ ins.
Boiler, working pressure		170 lbs.
Boiler, fuel		Soft coal
Boiler, staying		Radial

Tenders, wheels, diameter		33 ins.
Tender, journals		$5\frac{1}{2}$ x 10 ins.
Tender, tank capacity		6,000 gals.
Tender, fuel		10 tons
Engine equipped with fire tube superheater.		
Superheating surface		462 sq. ft.

Birthdays of Transportation Men in January.

Many happy returns of the day to:—
W. U. Appleton, Assistant to Superintendent of Motive Power, Intercolonial Ry., Moncton, N.B., born there, Jan. 29, 1878.

A. H. Bears, Master of Bridges and Buildings, C.P.R., Saskatoon, Sask., born at Charlottetown, P.E.I., Jan. 6, 1857.

F. X. Belanger, General Freight and Passenger Agent, Temiscouata Ry., Riviere du Loup, Que., born at Chlory-dormes, Que., Jan. 20, 1876.

R. H. Bell, Commercial Agent, Canadian Northern Ry., Pittsburgh, Pa., born at Toronto, Jan. 13, 1865.

G. McL. Brown, European Manager, C.P.R., London, Eng., born at Hamilton, Ont., Jan. 20, 1866.

W. H. Burr, Traffic Manager, Dominion and Western Express Cos., Toronto, born at Bloomington, Ill., Jan. 19, 1864.

Ten-wheeled Locomotive for Duluth, Winnipeg and Pacific Railway.

The fire-door opening is formed by flanging both sheets outward, and uniting them with a sleeve.

The superheater is of the top-header type, with $1\frac{1}{2}$ -in. pipes; and the elements are placed in 24 tubes, each $5\frac{3}{8}$ ins. in diameter. Considering each square foot of superheating surface as equivalent in value to $1\frac{1}{2}$ sq. ft. of evaporating surface, the total equivalent heating surface of the boiler is 2,613 sq. ft., or 229 sq. ft. per cubic foot of cylinder volume.

The superheated steam is conveyed from the header to the steam chests through pipes which pass through the side walls of the smoke-box. The steam thus reaches the cylinders in the most direct manner possible. The distribution is controlled by 12-in. piston valves, arranged for inside admission and set with a constant lead of $\frac{1}{4}$ in. The cylinders are bushed, and the piston and valve rods have front extensions. A five-feed lubricator is placed in the cab, and separate leads are run to each cylinder and steam chest, while the fifth lead is run to the two air pumps. The valve gear is of the Walschaerts type. Castellated nuts are used on the motion work, crank pins and crosshead pins.

Firebox, material		Steel
Firebox, length		113 $\frac{1}{2}$ ins.
Firebox, width		40 $\frac{1}{4}$ ins.
Firebox, depth, front		79 ins.
Firebox, depth, back		70 ins.
Firebox, thickness of sheets, sides		$\frac{3}{8}$ in.
Firebox, thickness of sheets, back		$\frac{3}{8}$ in.
Firebox, thickness of sheets crown		$\frac{3}{8}$ in.
Firebox, thickness of sheets, tube		$\frac{1}{2}$ in.
Water space, front		4 ins.
Water space, sides		4 ins.
Water space, back		3 $\frac{1}{2}$ ins.
Tubes, diameter		$5\frac{3}{8}$ and 2 ins.
Tubes, material		Steel
Tubes, thickness		$5\frac{3}{8}$ ins.
Tubes, thickness		2 ins.
Tubes, number		24 $5\frac{3}{8}$ ins.

W. A. Cowan, Assistant to Assistant Chief Engineer, C.P.R. Eastern Lines, Montreal, born at Galt, Ont., Jan. 22, 1877.

J. E. Dalrymple, Vice President, G.T.R., Fourth Vice President, G.T.P.R., and Vice President, Central Vermont Ry., Montreal, born at Montreal, Jan. 1, 1869.

J. E. Everell, Superintendent, Montmorency Division, Quebec Ry. Light and Power Co., Quebec, born at Cap Rouge, Que., Jan. 1, 1863.

Sir Sandford Fleming, K.C.M.G., director, C.P.R., born at Kirkcaldy, Scotland, Jan. 7, 1827.

W. H. Gougem, Locomotive Foreman, C.P.R., Cartier, Ont., born at Point Alexander, Ont., Jan. 16, 1872.

Gordon Grant, Chief Engineer, National Transcontinental Ry., Ottawa, born at Dufftown, Scotland, Jan. 2, 1861.

H. V. Harris, ex-General Manager, Midland Ry. of Nova Scotia, now of Montreal, born at Devonport, Eng., Jan. 16, 1857.

G. F. Hichborn, formerly Agent, Great Eastern Fast Freight Line, New York, born at Boston, Mass., Jan. 13, 1875.

Carl Howe, Manager, New York Central Fast Freight Lines, Chicago, Ill.,

born at Berrien Springs, Mich., Jan. 11, 1870.

W. C. Hunter, ex-Manager, New Brunswick Coal and Ry. Co., Sussex, N.B., born at St. John, N.B., Jan. 4, 1865.

W. J. Hunter, Division Freight Agent, G.T.P.R., and Commercial Agent, G.T.R., Winnipeg, born at Toronto, Jan. 10, 1864.

H. G. Kelley, Vice President, G.T.R., Montreal, born at Philadelphia, Pa., Jan. 12, 1858.

James Kent, Manager, C.P.R. Telegraphs, Montreal, born Jan. 15, 1854.

A. Lichtenhein, Galena Signal Oil Co., New York, born there, Jan. 15, 1855.

A. J. McGee, Secretary-Treasurer, Temiskaming and Northern Ontario Ry., Toronto, born at Lachine, Que., Jan. 24, 1876.

G. Pepall, Assistant Foreign Freight Agent, G.T.R., and Agent, National Despatch-Great Eastern Line, Toronto, born at High Wycombe, Bucks., Eng., Jan. 15, 1849.

W. Phillips, General Freight Agent, Canadian Northern Ry. Eastern Lines, Toronto, born there, Jan. 31, 1870.

W. Pratt, Superintendent, Sleeping and Dining Cars and Hotels, Canadian Northern Ry., Winnipeg, born at Sibbertoft, Northamptonshire, Eng., Jan. 18, 1870.

John Pullen, President, Canadian Express Co., Montreal, born at Shepton Mallet, Eng., Jan. 23, 1863.

L. J. Rouleau, Travelling Freight Agent, G.T.R., and Agent, National Despatch-Great Eastern Line, Montreal, born there, Jan. 6, 1879.

B. G. F. Rutley, ticket agent, C.N.R. and G.T.P.R., Fort Garry Union Station, Winnipeg, born at Chatham, Ont., Jan. 25, 1879.

S. J. Shannon, Comptroller and Treasurer, Intercolonial Ry., Moncton, N.B., born at Halifax, N.S., Jan. 18, 1865.

J. G. Sullivan, Chief Engineer, C.P.R. Western Lines, Winnipeg, born at Bushnell's Basin, N.Y., Jan. 11, 1863.

J. A. Villeneuve, Comptroller and Treasurer, Richelieu and Ontario Navigation Co., Montreal, born there, Jan. 4, 1864.

O. C. Walker, Inspector, Refrigerator Service, C.P.R. Western Lines, Winnipeg, born at Newport, Mon., Eng., Jan. 31, 1877.

F. J. Watson, Assistant General Freight Agent, G.T.R., Montreal, born at Toronto, Jan. 12, 1866.

G. H. Webster, C.E., Vancouver, B.C., born at Creemore, Ont., Jan. 31, 1858.

T. H. White, Chief Engineer, Canadian Northern Pacific Ry., Vancouver, born at St. Thomas, Ont., Jan. 27, 1848.

A. Wilcox, General Superintendent, Western Division, C.N.R., Edmonton, Alta., born at Kincardine, Ont., Jan. 2, 1865.

Regulations for Transportation of Milk.

The Board of Railway Commissioners, on the application of the Montreal Milk Shippers' Association, has passed the following order, 15413, which has already gone into effect:—

That milk be transported in baggage cars upon the following conditions:—

All cans must have name or initials of owner on cover or shoulder, in stencilled (not painted) letters, size not less than one inch.

All cans must bear name of shipping station in stencilled (not painted) letters, size not less than one inch, same to be placed on shoulder of can.

Each can of milk shall have attached to it, in addition to the milk ticket as now in use, a shipping tag addressed to consignee, and agents and train baggage-men shall not be required to receive cans for shipment, unless so tagged, and shall not be required to accept cans for shipment not properly and legibly stencilled.

Covers of cans must be securely attached to cans to prevent spilling or pilferage of contents, and where possible they shall be wired on and sealed with lead seals.

All cans shall be loaded by shippers at shipping point.

Empty cans shall be returned by the railway company to the shipping point without other charges than payment of original tolls. Where the number of empty cans is 20 or less, unloading at

shipping point shall be done by employees of railway company. Where the number of cans is more than 20 and less than 40 shippers shall provide one man at shipping point for assisting in unloading. Where number of cans is 40 or more, shippers shall provide two men for assisting in unloading; provided that shippers shall not be required to attend at shipping point to assist in unloading at more than one train each day. In event of trains being delayed more than 30 minutes beyond schedule time of arrival, all empty cans shall be unloaded by employees of railway company.

On and after Sept., 1912, railway companies shall not be required to accept for transportation any cans of less capacity than eight gallons, whether containing milk or empty.

On and after Sept., 1912, milk shipments shall be handled on memorandum forms, and receipts shall be taken from consignee. This will be supplemental to ticket system now in effect, the railway company providing necessary shipping forms to all milk shipping stations. At stations where companies have regular agents, such agents shall fill in the form respecting number of cans to be shipped, from information supplied by shippers. Such memorandum shall then, in the hands of the train baggageman, accompany shipment to its destination, where the company shall obtain receipts from consignee.

At flag stations billing shall be done by shippers, who shall enter the various consignments on one form, in legible writing.

Shippers must have milk at point of shipment, properly way-billed, at least 15 minutes before arrival of train on which it is intended to be shipped.

Railway companies shall continue issuance of milk tickets, which shall be good only if presented within one year from date of issue.

Railway companies shall not be liable for loss of, or damage to, or delay in any shipment of milk or empty cans, unless same be caused by or result from negligence of the company, or its servants or agents.

Freight Rate From the East to the Prairie Provinces.

The Supreme Court of Canada, on Dec. 6 dismissed the appeal of the Canadian Northern and Northern Pacific Railway Companies vs. the Regina Board of Trade, the subject of the appeal being the Board of Railway Commissioners' order 12520, of Dec. 10, 1910. The Regina Board of Trade applied under secs. 314 and 339 of the Railway Act, for a reduction in rates in classes 1 to 10 on goods shipped from Eastern Canada to Regina. The Board of Railway Commissioners ordered that the C.P.R. and C.N.R. publish and file new freight tariffs, to take effect not later than April 1, 1911, removing the discrimination at present existing in the tariffs to points in Manitoba, Saskatchewan and Alberta, from Fort William. Port Arthur and points east thereof, in favor of Winnipeg and other points in Manitoba, and against points west thereof, by reducing the rates from Fort William, Port Arthur and points east thereof, to Regina and Moose Jaw and other points west of the said favored points. The Supreme Court's judgment confirms this order.

On a similar application by the Edmonton Board of Trade the Chief Commissioner decided, Dec. 21, 1910, that the order made in the Regina case should apply.

Anglo-Canadian Contractors, Ltd., has been incorporated under the Dominion Companies Act, with \$250,000 capital and office at Toronto, to carry on a railway, marine and general contracting business.

Telephone Train Dispatching Circuits on the Canadian Pacific Railway.

Following are particulars of the various telephone train dispatching circuits installed on the C.P.R. up to date, for which we are indebted to W. J. Camp, Electrical Engineer, C.P.R. Telegraph Department. It is expected that additional circuits will be installed after the appropriations for 1912 have been made:—

Terminal Points	Dispatchers' Location.	Miles Crkt.	No. in use.	Selected sets.	Kind of Equipment.	Date put in service.
St. John-Vanceboro	St. John	90	17	3	Gill and N. E.	Aug. 27, 1911

Bridging sets				4		

* Under construction.

† May be combined in one circuit.

516 Stations.

A circuit has also been installed on the branch line from Kentville to Kingsport, N.S., 14 miles, which is a portion of the Dominion Atlantic Ry. now under C.P.R. control.

Schemes of Erection Proposed for the Quebec Bridge.

In our last four issues we gave the schemes of erection proposed by the St. Lawrence Bridge Co., the British Empire Bridge Co., the Pennsylvania Steel Co., and Maschinenfabrik Augsburg-Nuernberg A.G., the latter for the Board of Engineers' design only. Following is the Maschinenfabrik Augsburg-Nuernberg A.G., bidder's design:—

The design proposed has a single-intersection web-system, similar to the board's design, but the web triangles are considerably larger. The lengths of the several arms of the bridge are somewhat different, but the main span is unchanged. The design was made with the intention of floating in the suspended span.

On account of the long panels the floorbeams are very heavy. To facilitate manufacture and erection, they are built as box-girders, the two webs being shipped separately and connected after erection by a cover plate. In order to limit as much as possible the use of secondary members and also to facilitate certain parts of the erection, eyebars are used to only small extent in the design. The top chords and main tension members are built-up riveted members. Each main pier is provided with a

While the shoe is being put in place, the temporary falsework at points 6 and 7 is raised and posts 6, 7 and 8 erected along with the sway bracing of the bridge. The crane trestle for the anchor arm and its two travelling cranes are placed on top of the group of posts 6, 7 and 8, which with its permanent and temporary bracing acts as a tower. After the cranes have erected the missing parts of the main trusses and the flooring between 6, 7 and 8, the crane trestle is brought to its second position on the posts 6 and 7 in order to make way for the cantilever-arm crane trestle and cranes. These cranes then build panel by panel the main trusses, bracing and floor of the bridge up to the anchor pier on one side and the end of the cantilever arm on the other, employing during the operation such temporary members as are required.

All material for erection is lifted on to the bridge from scows. The hoisting is done by a crane travelling on the floor of the bridge, having a capacity of 200,000 lbs. This crane can then transport the material to any point on the bridge where it is required. The runway tracks of this crane always project beyond the last panel erected in order to serve the overhead cranes to the best advantage.

Maschinenfabrik Augsburg-Nuernberg A.G. Bidder's Design.

special pedestal of cast steel providing a central transmission of load on the pier and permitting of free deflection of the bridge. The pedestals are set on riveted steel grillages sunk into the masonry piers to provide a uniform distribution of load. The centre span is suspended from the cantilever arms by means of cables, just as proposed for the board's design.

The plan shows several stages in the erection, and illustrates the general method proposed. Both arms are to be cantilevered out from the main piers and the stability of the work ensured by temporary supports under the anchor arm. In this case, however, travelling cranes are operated on the top chords, two on each anchor arm and two on each cantilever arm at the same time. These cranes have 82-ft. booms and are arranged so as to be able to be moved crosswise on a crane trestle which itself can move longitudinally on the upper chords of the bridge. All cranes as well as the crane trestles are operated by means of electrically-driven winches. Each of the cranes has a maximum lifting capacity of 120,000 lbs. at the extreme end of its boom and a capacity of 200,000 lbs. within a closer area.

The erection of the main bridge starts with the laying down of the shoes. These shoes are designed to be floated in place and to be set on previously prepared bearings as the tide goes down.

The suspended span would be erected on high falsework as for the board's design. The span is supported at each panel-point, by a truss on the falsework, the whole carried on four pontoons each 295 ft. long and 49 ft. 3 ins. wide. When the suspended span has been completely erected on the floating scaffolding, it is towed to the bridge site. After its arrival there it is accurately held in position by means of wire cables and winches placed on the river banks.

To facilitate the operation of coupling up the suspended span to the cantilever, as well as to avoid blocking traffic on the river any longer than absolutely necessary, a special supporting and lifting device is provided at the ends of the cantilever arm. This temporary support is made of cross beams suspended from the end posts of the cantilever arms by means of hinged tension members. At high tide these supports, previously swung back in a slanting position towards the piers to allow the suspended span to be floated into its closely approximate final position, are allowed to swing back to their normal position, the cross beams passing under the ends of the bottom chord of the suspended span at its four corners. As the tide goes out the bridge comes to rest on these temporary supports and the falsework floats clear. The suspended span is then adjusted to its final position by means of 16 hydraulic jacks located on the upper

chord, each having a capacity of 1,322,000 lbs. and a lift of about 3 ft., operating a frame connected to the above mentioned cross beams. A safety device holds the cross beams in place step by step as it is raised, thus providing against any accident. When the lifting has been completed the wire hangers are fitted to their bearings and the suspended span, previously lifted a little too high, is lowered to its permanent position.

Telephone Train Dispatching on the Algoma Central and Hudson Bay Railway

This line has been dispatching trains by telephone since 1902, using on the Main Line Division the Bell 1000 ohm magneto type wall instruments and on the Michipicoten Division the New State 89 ohm series instruments.

Last spring the construction of a metallic circuit of no. 12 new British standard hard drawn copper wire was commenced. When completed the line will extend from Sault Ste. Marie, north to Hobon, 195 miles, with connection at Hawk Lake with the Michipicoten Division metallic circuit of 36 miles, covering the Michipicoten, Josephine and Magpie branches and serving the Helen and Magpie mines. The existing pole lines were practically rebuilt last summer and new lines have been built from Pangissin, 68 miles north of Sault Ste. Marie, to mileage 107, and from Josephine Mine Jct. mileage 107 to 125. The gap of 18 miles is now being closed and it is hoped to secure communication between Sault Ste. Marie and Michipicoten Harbor early in January.

The Hawk Lake-Hobon extension of some 30 miles will be built next spring and further extension of the system north of the C.P.R. proceeded with. A portion of the new dispatching telephone apparatus will be installed this winter and the installation, with the exception of the Hobon extension, will be completed early next spring. This will give a dispatching circuit of 190 miles for the present and 220 miles on completion of the Hobon extension.

The line has been constructed on a substantial standard specification and the equipment installed is the last word in up-to-date telephone apparatus. It is furnished by the Northern Electric and Manufacturing Co., Montreal, and consists of their dispatcher's telephone equipment, chest transmitter, head receiver, etc., and their selector equipment for calling stations. For stations at which agents are maintained the office is provided with their 1020 B transmitter arm and head receiver, and station selector set. Flag stations are provided with a 1317 W type wall telephone. Portable telephone sets with line poles are provided for use of train crews.

The system when completed will admit of the dispatchers communicating with one or more stations simultaneously, allow of the sending of time over the wire, and also the transmission of company's and commercial business.

Between Sault Ste. Marie and Searchmont, 30 miles, an iron metallic circuit is provided for commercial business and a ground circuit extends from Searchmont to mileage 79. On the Michipicoten branch an iron metallic circuit between Michipicoten Harbor and Helen Mine, 11½ miles, cares for commercial business and an iron ground circuit from Helen Mine to Grassett on the C.P.R. cares for commercial business between the mines and the outside.

We are indebted for the foregoing to G. A. Montgomery, Superintendent A.C. and H. B. Ry., at whose request it was prepared by C. Fitzsimon, Superintendent Telephone Construction.

Telephone Train Dispatching.

By A. Dwight Smith.

[This is the fifth of the series of articles on this subject, the previous ones having been published in our issues of Sept., Oct., Nov. and Dec., 1911.]

In addition to the regular telephone equipment in everyday use on train dispatching circuits, conditions to be met with are such that various types of auxiliary apparatus are also required. The most troublesome of all auxiliary ap-

paratus which place permanent high resistance grounds on the line are, of course, useless for telephone purposes on account of the noise they bring into the circuit, aside from other disadvantages such as slowness in dissipating a charge.

If a road is equipped with more than

in one direction and then in the other, and finding thus where the trouble is. In case of trouble in the station apparatus, that station can be cut off the line by the third switch, leaving the circuit cut straight through.

A portable train set, as used on wreck and regular trains, is shown in figs. 4

Figure 1. Telephone Protector.

paratus are the protective devices. It is fairly safe to say that no perfectly satisfactory protector has yet been developed by anyone. It has not been because of the lack of thought nor engineering ability, but because two irreconcilable conditions exist in telephone protection, and so far have rendered the problem unsolvable. The protector (fig. 1) must guard the apparatus from low voltage crosses, such as lighting and power wires, as well as from lightning. It must therefore operate at a low potential. When built with this in view,

Fig. 2. Knife Switch Test Panel.

the ground plate is in all cases so near the live plates that the spark-gap between is easily crossed by foreign matter, carbon dust, metal, or whatever material the plates are made of. This, of course, grounds the line permanently and renders it inoperative from noise, if there are any telegraph or power circuits in close proximity. If the plates are placed at a greater distance apart, the operating voltage is much higher, and the apparatus is not, therefore, protected as it should be. It has not been possible to solve this protection as yet, but since the railway's main object is to give service and they cannot stand for continued interruption to it from grounds on the protectors, it seems probable they will dispense with so much protection and take a chance of having the apparatus burned out occasionally rather than interrupt service so frequently from grounds.

Fig. 3. Telephone Line looped through Way Station.

one telephone circuit or has two additional telegraph wires suitably transposed, it is very desirable to make simple tests and patches, such as are accomplished on the peg switchboard in telegraph service. Fig. 3 shows a simple form of patching panel, which consists of five knife switches so arranged that if trouble occurs on the train wire, it is possible to patch around it by using the other available wires, and thus continuing the service until the cause of the trouble is removed.

When there is only one circuit installed along the road and no provision

and 5. The first of these is a large size magneto set equipped with a 5-bar generator and has most efficient construction throughout. This set is generally used when the dispatcher is provided with an extension bell and can be rung up in case of his absence from his desk. The other set is practically the same in construction, but does not contain the generator or ringer, as on most train wires the dispatcher is continually on the circuit and no signalling device is necessary. The Canadian Pacific Ry. has approximately 750 of these sets in use. It is equipped with a head receiver so that the train conductor can have free

Fig. 4. Magneto Portable Train Telephone Set.

has been made for altering existing telegraph circuits, it is merely looped through three knife switches at each way station. Fig 3 illustrates this. With this simple arrangement, it is possible for the dispatcher to locate trouble between any two stations by successive tests down the line; opening the circuit

Fig. 5. N.3a Portable Telephone Set.

use of both hands to copy his messages. To connect a portable set to the wire, a line pole is used, generally in three sections, and equipped with 100 ft. of flexible cord. A portable set is a wonder-worker for efficient train service, as communication can be immediately established between a distant point and headquarters.

Since the development of the telephone for train dispatching, the need has been felt for signalling equipment which could be used and operated in connection with the telephone train wire, that is, instead of having a selector on a telephone circuit ring a bell at a way station, it was required that it throw a semaphore arm. On steam roads it is used exclusively for train order work, in other words, it is employed as an auxiliary to a regular dispatching circuit. When used in this way, it will secure a still further saving than is now effected by the telephone.

A train order semaphore can be installed at any point desired along the right of way. The dispatcher can throw it to "stop" position at will by the same operation as when calling a way station. On the average railway equipped for handling train movements by telephone, there are a number of offices along it which have to be kept open 24 hours a day and where three tricks of operators must necessarily be employed for this purpose, merely to take care of a small number of trains. Of course, during the busy hours, it is necessary to have

provided the dispatcher had some means of reaching the trains.

Fig. 6 shows the semaphore complete. It is of standard make and is furnished

Fig. 6. Selectively Operated Semaphore.

Fig. 7. Telephone and Selector Equipment.

an operator on duty at the station, but at night or during very light load periods, there are numerous cases where he could be dispensed with altogether,

with either upper or lower quadrant types as desired. A three spectacle casting is provided. Semaphore, selector and telephone equipment are all mounted on the same iron post and the apparatus is self contained. The box is locked with a standard switch lock so that access is only obtainable by the proper parties.

Fig. 8 shows the pole casting containing signalling mechanism, the telephone and selector equipment. The semaphore equipment is of the electrically operated type and is manually restored. The relay operating this is normally de-energized and 10 dry cells are required for its operation. As the relay will operate on four cells, it is obvious that an ample margin of current is allowed. The signalling mechanism proper is contained in the compartment at the top of the casting; the only part of this which appears on the surface, on the inside door is the handle of the restoring lever. The selectors and terminals are readily accessible for maintenance purposes.

Fig. 8 shows the apparatus casting with the inside cover open. In this illustration will be seen the arrangement of the selector and terminal apparatus. The signalling mechanism is shown above together with the manually operated lever and the gears by means of which the semaphore blades are restored to "clear" position. All equipment is bridged across the telephone line, and any piece of apparatus can be removed without affecting the circuit. As many semaphores as desired can be installed either on a new line or on present existing circuits.

The flexibility of a railway telephone system for handling train movements and commercial messages is obvious from the foregoing. When these features are added to the many other advantages of the personal method of communication, it is small wonder that the telephone is advancing into its new field with rapid strides.

F. H. Frobert, Roundhouse Foreman, Intercolonial Ry., St. John, N.B., in remitting his renewal subscription, says: "I find the Railway and Marine World very valuable in my position."

Canadian Car and Foundry Co.'s Annual Report.

The report for the year ended Sept. 30, 1911, shows profits of \$1,007,137.58, which after deducting 7% dividend on preference stock, \$385,000, leaves a surplus of \$622,137.58. Out of this a common stock dividend of 4% has since been declared, leaving a surplus of \$467,137.58 out of the year's earnings, being about \$23,000 greater than for the previous years.

The gross sales for the year were over \$12,500,000, being a considerable increase over the previous year; however, the serious trade depression in the United States, particularly in car equipment lines, necessitated a reduction in the percentage of profit on sales, as U.S. manufacturers in many cases sought business at bare manufacturing cost, or less, in order to maintain their organizations. A large proportion of the materials entering into car construction have to be imported into Canada and the freight and duties payable on such materials largely offset the protection afforded by the duties on finished products.

At the close of the fiscal year the unfilled orders on the books amounted to over \$5,000,000.00. On Nov. 20 they amounted to approximately \$10,000,000.00; and while, on account of the depression in the U.S., much of this business has been taken at rock bottom prices, it should practically ensure continuous operations at capacity for 1912 and a large saving in running expenses.

The increasing general prosperity of Canada, coupled with the demands of the railways for the company's products, easily make manifest the fact that the manufacturing facilities must be increased. This was particularly the case in respect to passenger car equipment and also by the increasing demand for freight cars of steel or steel underframed construction. The directors authorized extensions to the passenger car departments at Amherst and Turcot (Montreal); a new steel freight car department added to the Turcot works, an addition to the steel car plant at the Dominion works, and an extension to the malleable iron foundry at Amherst. These improvements are now all under way and steel underframed cars are being built at the Turcot works. The total cost, upon completion, will be approximately \$350,000. The directors believe that this expenditure will be fully justified by results and will enable the company to more fully meet the railway requirements at all times.

Shortly after the organization of the company, it became apparent that facilities would have to be arranged for the production of steel castings which are entering more and more largely into the products. Early in 1911 it was found possible to secure the properties of the Montreal Steel Works, Ltd., and the Ontario Iron & Steel Co., Ltd., of Welland, Ont., the former being the largest producers of steel castings in Canada, the latter having both a steel foundry and a rolling mill. The Montreal Steel Works had also commenced the erection of a modern steel casting plant in Montreal in addition to its existing facilities. After careful consideration the directors deemed it wise to secure these properties and the Canadian Steel Foundries, Ltd., was formed for that purpose.

It was found advisable to make extensive improvements at the Welland plant. The new plant at Montreal will not be fully completed and ready for operation until the spring of 1912.

The directors were re-elected. The principal officers for the current year are:—N. Curry, President; W. W. Butler, Vice President; V. G. Curry, Second Vice President.

Efficient Shop Operation.

By E. T. Spidy Assistant to General Locomotive Foreman, C. P. R. Winnipeg.

In this paper I propose to bring out some of the various points that go to make an efficiently operated shop, and to make a few notes on each. Not very long ago the whole business of shop efficiency was considered part of the foreman's duties and it is mainly due to the demand for increased output that the shop engineer is now a recognized necessity to relieve the foreman of that part of his work relating to machinery upkeep, tools, and general improvements. The foreman is the man on whom the responsibility of the individual shop rests. He is the hub, as it were and the smooth working of all the minor wheels depends on his ability as an organizer, and on the amount of co-operative effort he receives. The first point I would draw your attention to is shop organization. By shop organization I mean the plan of control by means of which the whole work of a plant is divided and sub-divided among foremen and chargehands, that the responsibility for any particular detail can be instantly located. The organization of any shop is governed by its size, the class of work handled, and the conditions met with, peculiar to itself. Obviously no definite rules can be laid down. A shop may be organized to specialize as much as possible, or specializing might be impracticable. For example, take a locomotive erecting shop, in one shop we see that the gang boss has the entire erecting of an engine to look after from stripping to finishing, while in another shop we see the chargehand concerned with the general erecting alone, while a special gang strips the engine, another gang is responsible for shoe and wedge work, another for motion, and so on, that the whole work is in the hands of men who become specialists at their work. In a small shop the amount of specializing that can be carried on these lines is minimized, but even here, we see in some shops that a certain man always does the same job on an engine and so becomes a specialist on that particular job.

In manufacturing shops operated on a modern piecework or bonus system the introduction of functional foremen has proved successful. These functional foremen are additional, and they are responsible for certain functions of the shop that can be better handled by men who become experts, than by the regular foremen. In a piecework shop specializing becomes a necessity, it enables the keeping of more accurate records. By dividing the work among specialists each man becomes independent of the rest, for he alone gets all the benefit of his increased efforts, whereas when the whole gang work together, the whole gang have to carry the slow men, and this is the cause of much dissatisfaction. Good shop organization has each man's duties very clearly defined. This clear defining of every man's duties is essential to economic operation.

A point I would make special reference to is standardization. Just how far standardization should be carried into a shop is hard to say, but it is one of the items that brings down costs, so is well worth considering. Hand and machine tools should be standardized as far as possible, as also should be the method of handling the same. All tools required should be handed to the men from a central distributing room situated as near the centre of the shop as possible. Machine tools should be forged in the smithy-shop and taken to the tool room, where they are ground ready for hardening. The toolroom itself should be equipped with a hardening furnace for machine tools, and an oven for hardening taps, dies, reamers, etc., that require

careful treatment. Tools such as taps, reamers, jigs, etc., should all be checked against the man receiving same. A system of giving each man so many checks when he enters the service and making him deliver one check for each tool received from tool store, keeps a tab on all tools, and placing the check where the tool came from simplifies the location of the tool, should it be called for by anyone else. All tools should be called in periodically that their condition may be observed and to keep stock up to date. All pneumatic tools should be brought in regularly for inspection and oiling, and if suspended in benzine they will be also thoroughly cleaned.

Machine tools should, as previously stated, all be ground in the tool department by a man kept especially for the job. Lathe tools have a definite shape and all angles of lip and clearance are fixed to a standard. For roughing tools the clearance angle, that is the angle behind the cutting edge, is six degrees. Some English standards reduce this a little, but six degrees is the standard on this continent. The back slope and side slope are respectively eight and 14 degrees. These angles are accepted standards, they represent part of results obtained by experiment and modern practice on heavy duty machines. Boring mills do not have a tool of the same height as lathes and the back and side slopes are usually reduced a few degrees. Planer tools reduce on the clearance angle and have only two degrees. This gives a stiffness behind the point of the tool and supports it on entering the metal, and also reduces the tendency to chatter. All tools used on machines, whether they are roughing, finishing, knife, or parting tools, can be handled better by a separate department such as the tool room, than by individual workmen.

The reason for the many shapes of tools found in a shop, not systematically handling the same, is that instead of being the result of each man's experience, it is merely the result of custom, the difference between which is very obvious. The same applies to the tool smith. It used to be bad policy to fall out with the man who hardened your tools, anybody who has ever worked under that system knows why, however, with the smith fully acquainted with the methods of treating the many different kinds of steel he is called on to do in these days, it is reasonable that if he does his work in quantities at one time, instead of one of this, and one of that, while somebody waits on him, he will turn out better and more work and get more satisfaction out of it as well.

Driving wheel lathe tools are all special shaped tools, however they should all go through the same process in handling. Considerable saving is claimed by the Montreal Locomotive Works on large finishing tools by welding a piece of high speed steel into a billet steel shank. The cost of such tools is very small compared with solid high speed tools of the necessary heavy section. The same process was tried at the C.P.R. shops in Montreal. Whether it was the hard tires or not I do not know, but I believe the success met with was not convincing enough for it to be adopted as a standard. Some smaller special tools, however, are high speed steel tipped right along. High speed steel used for tools used only occasionally represents capital tied up. If you can use your odd ends to tip special tools you are certainly getting better interest on your outlay.

While on the subject of machine tools, the question of standardization of tool steel comes up. This is a difficult matter to decide, especially as each steel maker claims that his is the best. No one wants inferior tool steel, so the only thing to do is to experiment ourselves

with our own particular classes of material and determine what best suits us. Although it may be impossible to adopt a standard steel for all work, it can be found better on a certain class of done so far that a certain tool steel will work. High speed steel forms a large expenditure item that makes this very desirable.

In connection with this work comes the efficient operation of the individual machines. Machine speeds have gone up during the past few years and the tendency is to go still higher. It is necessary to have a range of speeds on each machine suited to the class of work to be operated on. Take the case of drilling machines. Since the advent of high speed drills, the correct number of revolutions per minute has increased on an average 75% over the speed called for by carbon twist drills. The extra high speed or flat twisted drill which is being used on certain classes of work demands a speed 130% over the original speed for the same size of drill. Unless drills are run at the proper speeds they cannot work efficiently and so the value obtained is minimized. A machine to drill holes from $\frac{1}{2}$ in. to $2\frac{1}{2}$ in. needs a capacity from 50 to 500 revolutions a minute. High speed drills less than $\frac{1}{2}$ in. diameter call for higher speeds than 500 revolutions a minute, but unless the machine is of modern design it is inadvisable to go above this, for the vibration set up not only racks the machine to pieces in a short time, but makes true holes difficult to obtain, and breaks many drills. Twist drills should never be used in cored holes, for flat drills, made out of odd ends of high speed tools, will do the work far better, and be very much less expensive.

Feeds for drills vary with the metal drilled. Taking medium cast iron, a basis for a high speed drill is .01 in. per revolution, per inch diameter of drill, this, however, cannot be considered more than a guide. Records given at the Master Mechanics' Convention this year in Atlantic City show that feeds of one-tenth of an inch per revolution at 575 revolutions per minute were obtained in cast iron billets with a $1\frac{1}{4}$ ins. drill removing metal at the rate of 70.55 cub. ins. a minute. This, of course, is phenomenal and was made under ideal conditions. Cutting speeds on lathes, boring mills, etc., have also increased and tend to increase with each improvement in tool steels. It is impossible to do more than make an average statement of what speeds should be used on various metals, owing to the many variable elements to be considered that influence the same. The size of the tool and the quality of the tool steel, the capacity of the machine, the material operated on, the depth of cut taken and the feed employed all influence the cutting speed. It must be granted that there are certain combinations of these elements that are better suited to each job than others, but to determine the correct combination to remove a certain amount of stock in the most efficient manner necessitates a detail study of the machine from a power standpoint and also an intimate knowledge of each condition to be met. It is considered best practice to remove the necessary metal in one or two cuts, according to the amount to be removed, and to use the heaviest feed practicable in connection with available speeds. The size of the tool is set to some degree by the machine and in experimenting with tools up to $1\frac{1}{4}$ in. in width they should be figured to stand 30 minutes maximum cutting before signs of failure. Careful experiment will afford much information on the relations between these elements and will give some accurate idea of what can be expected from each tool. Modern lathes, 6 in. centres, require 5 h.p. to drive, while a 24 in. centre lathe needs 30 to

40 h.p. to keep going, the latter power being necessary with two tools in operation. Stroke machine speeds have risen in line with other machines. Modern high speed planers have cutting speeds from 30 to 90 ft. per minute with a return speed 200 ft. per minute. The development of electrical reversing gear is an indication of progress.

Milling machines are a great asset in a manufacturing shop, especially where any amount of duplicate work is done. An average cutting speed is about 70 ft. per minute, but this, of course, is dependent on the stock being removed. Feeds vary from $\frac{1}{2}$ in. per minute to 20 in. or more, dependent on the work also.

Grinding machines are now an asset to railway shops, and are almost indispensable. They take work roughed out in other machines and finish it quickly and accurately. Grinding is in reality milling on a finer scale. Motion pins and shafts make a cheaper and better job than a lathe. A wheel 25 ins. diameter running at 5,000 ft. per minute gives good results. At the C.P.R. Montreal shops, new piston rods are rough turned in the lathe only, the body is ground to size removing 1-32 in. of diameter with a wheel running at 5,000 ft. per minute. The rod is rotated at 20 revolutions a minute, while the traverse of the wheel on the rod is 38 inches a minute. This entirely dispenses with the rolling operation.

A large amount of taper reaming is done in connection with locomotive work, but very little advantage seems to have been taken, so far, towards getting better tools than have been in use for many years. The straight fluted reamer may be all right for parallel holes, but for taper holes the spiral reamer is superior to all others, long or short. The straight fluted reamer has to take a cut its whole length at one time by a drag or scrape process. The cutting action here is weak, for the length of the shaving prevents little more than a scrape being taken. The eccentric fluted reamer has an advantage of not chattering and is superior to the ordinary equal fluted reamer, but with a spiral reamer we have a shearing action by means of which a cut is started at one point and carried until it leaves the edge of the tool. Spiral reamers should be made left handed, so that the tendency is to draw itself from the hole, and not into the hole. This left handed spiral will also, by the same tendency, clear itself of the chips, and will not clog nearly so much as the straight fluted reamer. The benefit of the spiral reamer is also shown in the fact that the power required to drive it is much less than with the straight fluted type of the same size. If these are made of high speed steel they will do better service still. Although they are most costly to make the saving will warrant the expenditure easily.

Milling cutters come in the same class as reamers. The practice of using inserted toothed milling cutters for the larger sizes is almost universal. Billet steel makes an ideal centre and the blades should be made from old high speed machine tools forged to proper dimensions and machined to fit the grooves in the body. The grooves in the body are cut at an angle to the axis, so as to approximate the ideal as nearly as possible, the ideal being of course the spiral. The blades are fitted and lightly caulked in place, and then turned over the top to requisite diameter, to be afterwards removed and hardened, and then replaced and ground. The straight blade cutter, however, has a disadvantage, not met with in a spiral milling cutter, which is rather difficult to overcome. It will be seen that the clearance lip in front of the cutting edge touches the work at varying angles throughout the length of the blade, so that if the blade is set that its centre has the correct

clearance lip, one end will have excessive lip, and the other a minus lip that results in a drag action at that end of the cutter. This also produces uneven strains which not only tend to loosen the blades, but which puts the whole cutter out of action just as soon as the weakest portion, which is where the scraping takes place, becomes dull. It is possible to set the blades back from the axis that there is always a cutting lip, but then the excessive lip at the other end is increased. Not much attention has been paid to this point until recently. A shop I am acquainted with now mills the entire face of the blade that projects from the body. This obviates the evil entirely and makes the tool an equivalent of a solid spiral milled cutter. The practice of making solid plain milling cutters entirely of billet steel is an economic one where the metal to be removed is of even character and not very hard, and is to be recommended, especially on new work of a straightforward nature. These tools are made precisely the same as any other cutters with spiral flutes, but are casehardened as deeply as possible. Axle steel or any high carbon steel will make admirable cutters if case-hardened properly.

The standardization of shop methods is a question that has not been very seriously considered in railway shops,

for repairs are ordered out by a certain date, in consequence of which every detail is scheduled to be repaired and replaced on the engine to conform with this date. This scheduling of work is comparable to the scheduling of trains, the dispatcher knows the location of all his trains and when they are due at the next point, accordingly he moves everything to ensure continual running and to avoid confusion. With this basis in our shop similar control is obtained.

To have an efficiently operated shop it is necessary to maintain a high standard of repair on every machine. Belts must not be neglected and a system should be employed to enable the belt man to be located at all times. The class of hoist each man has at his command is of importance, and wherever practicable individual hoist service is to be recommended. Jigs, labor saving devices, or ideas should be encouraged and advantage should be taken of the kinks put forward in our technical journals to reduce shop expense.

The foregoing is only the material side of the question of shop efficiency. It needs the co-operation of the whole staff to get results, and it has no place for a man who does not take a lively interest in every detail intended for the benefit of his shop. The co-operative effort of every workman is desirable. The object

Angles A and B show how angle between milled surface and front edge of cutter varies at each end of blade. Angle A is actual clearance lip at one end. Angle B is the minus lip that causes scraping.

until very recently. It is an essential feature in shops run on a scientific basis with piece work or bonus system in vogue. No one would argue that there is not a best method of doing a job, and if a means is secured whereby it is possible to find the best method and to maintain it, there is no room for doubt that considerable saving is effected. With new work the standardization of methods can be accomplished without very great difficulty, but even with repair work considerable can be done in merely definitely establishing the method of repair and the route the work is to take through the shop. The cost of getting the necessary records for this purpose is more or less high, because it entails a scientific investigation of each move by the operator and the condition under which he works. Just as a scientist, who, in order to solve any complex problems analyses each and every detail of the case very minutely, so must the same principle be applied to each operation performed in the shop, that details, insignificant in themselves, may be brought to light and studied as to whether they are essential to the job or not, and if they are, that they are being performed as efficiently as possible. This investigation obviously necessitates a man trained in the work, for it is beyond the foreman entirely to spend the time or to get the information requisite. The handling of material from shop to shop, and from machine to machine is also now brought down to a science. By a schedule system, locomotives shopped

in view is to bring the conditions affecting the shop to a point as unvarying as possible. So that the greatest advantage is taken of modern facilities, and the abuse of the same is minimised. In short, to use the words of a well known efficiency engineer, "Our object is to get the right job done on the right machine, in the right manner, by the right man and at the right time." When we achieve this we shall have an efficiently operated shop as far as the human element can make it.

The foregoing paper was read before the Western Canada Railway Club recently.

Railway Lands Patented.—Letters patent were issued during Oct., 1911, in respect of railway lands in Manitoba, Saskatchewan, Alberta and British Columbia, as follows:—

	Aces.
Canadian Northern Ry.	12.38
Canadian Pacific Ry.	361.59
Grand Trunk Pacific Ry.	219.65
Qu'Appelle, Long Lake and Saskatchewan Rd. and Steamboat Co.	639.00
Total	1232.62

A. J. Shapter, engine tester, G.T.R., Montreal, writes:—"I am well pleased with The Railway and Marine World."

The prize of \$1,000, recently offered by Sir Thomas G. Shaughnessy, President, C.P.R., for the best sample of wheat grown on the continent, has been won by S. Wheeler, Roathan, Sask. The alternative exhibit was by W. J. Macleod, Alta.

Orders by the Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers, are those on which the hearing took place and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

15390. Nov. 16.—Authorizing B.C. Public Works Department to build highway crossing over Shuswap and Okanagan Rys. (C.P.R.) at Grindrod station.

15391. Nov. 15.—General order re cartage limits at cartage points.

15392. Nov. 15.—Authorizing V.V. & E. Ry. to cross C.P.R., Vancouver Power Co.'s line, and highway, and also authorizing two overhead and one grade crossing of highways in New Westminster District, B.C.

15393. Nov. 15.—Approving location and plans of G.T.R. station at Maxville, Ont.

15394. Nov. 14.—Ordering G.N.R. to build spur to W. H. Haight's premises, Pipers Siding, B.C., and to file tariffs on fertilizer from Vancouver and New Westminster to said spur. This order is given in full on another page.

15395. Nov. 16.—Approving G.T.R. bylaw authorizing J. E. Dalrymple, Vice President, C.A. Hayes, F. T. M. and H. C. Martin, G.F.A., to issue tariffs of freight tolls.

15396. Nov. 16.—Authorizing G.T.P.R. to divert road in n.e. ¼ sec. 26 and s.e. ¼ sec. 35, tp. 35, r. 14, w. 3 m., Sask.

15397. Nov. 16.—Authorizing C.P.R. to build double track across 17th Ave. and to close portion of 18th Ave., Moose Jaw, Sask.

15398. Nov. 16.—Ordering T.H. & B.R. to install within 90 days, improved type of electric bell at Wellandport road, St. Annes, Ont., 20% to be paid from railway grade crossing fund.

15399. Oct. 24.—Extending express delivery and collection limits in Walkerville, Ont.

15400. Nov. 17.—Ordering C.P.R. not to exceed 10 miles an hour over crossing two miles east of Montreal Jct.

15401. Nov. 15.—Authorizing C.P.R. to cross with its Lacombe Easterly branch, 25 highways in Alberta.

15402. Nov. 17.—Authorizing C.N.O.R. to cross C.P.R. near Nipigon.

15403. Nov. 14.—Authorizing G.T.R. to rebuild bridge at mileage 59.40, near Palgrave station, Ont.

15404, 15405. Nov. 16.—Authorizing G.T.P. Branch Lines Co. to cross and divert highway at mileage 112, Sask., and to divert road on its Regina-Boundary branch.

15406. Nov. 17.—Authorizing Kettle Valley Ry. to build bridge at first crossing of Kettle River, north of Midway, B.C.

15407. Nov. 18.—Authorizing G.T.R. to build spur into Harris Coal Co.'s premises, Coxwell and Rhodes Aves., Toronto.

15408. Nov. 17.—Authorizing Midland Ry. of Manitoba (G.N.R.) to cross C.P.R. spurs in Winnipeg at five points.

15409. Nov. 18.—Approving detail plans of abutment and wing wall of Church St. subway, Mimico, Ont.

15410. Nov. 16.—Authorizing Ottawa Electric Co. to erect wires across C.P.R. on Carruthers Ave.

15411. Nov. 17.—Ordering Dominion Ex. Co. to restore as special tariff its Standard Tariff C.R.C. 15 from 26 to 170 miles in effect prior to Oct. 15, 1911, and define more clearly the points between which it shall apply on complaint of W. J. Guest Fish Co., Winnipeg, re increased rates on fresh fish, Gimli to Winnipeg.

15412. Nov. 20.—Ordering C.N.R. to complete by June 1, 1912, suitable stock yard accommodation at Englefield, Sask.

15413. Sept. 26.—Stating conditions under which milk cans may be shipped in baggage cars after Oct. 1. This order is given in full on another page.

15414. Nov. 21.—Approving revised location of G.T.P.R. station at Cans, sec. 9, tp. 22, r. 5, w. 2 m.

15415. Nov. 20.—Authorizing C.N.R. to cross public road on its Swift Current extension, Sask.

15416. Nov. 15.—Authorizing C.P.R. to build spur into W. C. Edwards Co.'s premises, Nepean tp., Ont.

15417. Nov. 21.—Approving detail plans of subway under C.P.R. at 11th Ave., Moose Jaw, Sask.

15418. Nov. 22.—Authorizing C.N.O.R. to divert Otter Creek and build bridge over it, in South Elmsley tp., mileage 50.1 from Ottawa.

15419. Nov. 20.—Authorizing C.N.O.R. to

divert Opinicon Road by overhead bridge, Loughborough, tp.

15420. Nov. 20.—Authorizing G.T.P. Branch Lines Co. to cross and divert highway mileage 108.6 to 108.9, Prince Albert branch, Sask.

15421. Nov. 20.—Authorizing G.T.R. to operate over C.P.R. at Nipissing Jct., Ont., to a connection with T. & N.O.R., watchmen to be employed day and night, pending completion of interlocking plant.

15422, 15423. Nov. 21, 22.—Authorizing C.P.R. to expropriate certain lands for extension of yards, construction of machine shops, roundhouse, etc., at West Toronto, and land required for double track, at Perth, Ont.

15424 to 15426. Nov. 22.—Authorizing G.T.P. Branch Lines Co. to divert road at mileage 22.2 Battleford branch to cross two highways on its Biggar-Calgary branch at mileage 80.8 and 85, and to cross six highways with its Cutknife branch.

15427. Nov. 22.—Approving revised location of G.T.P.R. station at Clavet, sec. 9, tp. 53, r. 3, w. 3 m.

15428. Nov. 21.—Authorizing G.T.R. to build two additional tracks across road allowance 25, con. 1, Himsworth tp., Ont., and to connect with Trout Creek logging spur.

15429, 15430. Nov. 21.—Approving revised location of C.N.O.R. Sudbury-Port Arthur line in Nipigon tp., mileage 68.58 to 69.53 and through unsurveyed territory, mileage 19.52 to 203.24 from Sudbury Jct.

15431. Nov. 21.—Authorizing C.N.R. to open for traffic part of its Maryfield extension from Radville to Bengough, Sask., 45 miles.

15432. Nov. 22.—Authorizing C.N.R. to cross public road on its Prince Albert-Battleford line, Sask.

15433. Nov. 21.—Authorizing C.P.R. to use bridge 32.7 on its Lardo subdivision, B.C.

15434, 15435. Nov. 21.—Authorizing C.P.R. to build spur to Yahk Lumber Co., East Kootenay District, B.C., and to operate additional track across road allowance at Hillcrest, Alta.

15436. Nov. 22.—Authorizing C.P.R. and C.N.R. to operate over completed interlocking plant in n.e. ¼ sec. 18, tp. 16, r. 13, w.p.m., Sask.

15437. Nov. 22.—Approving Bedlington and Nelson Ry. (G.N.R.) bylaw authorizing H. A. Noble, G.P.A., St. Paul, Minn., to issue tariffs.

15438. Nov. 22.—Authorizing city of Calgary, Alta., to carry its municipal railway over C.P.R. at 12th Ave., near 6th St.

15439. Nov. 21.—Authorizing C.P.R. to use bridges 101.1 and 84.6 on its Thompson subdivision, B.C.

15440. Nov. 21.—Authorizing C.P.R. to expropriate lands for new building and yard room, near Aroostook Jct. on New Brunswick Ry.

15441. Nov. 22.—Rescinding order 15251 Sept. 14, re C.P.R. train service at Moosomin, Sask.

15442, 15443. Nov. 22.—Authorizing C.P.R. to build spur for Standard White Lime Co., from Ingersoll subdivision at mileage 5.28, West Oxford, tp., Ont., and to build spur for Leitch Collieries at Passburg, Alta.

15444. Nov. 22.—Authorizing C.N.R. and C.P.R. to operate trains, without coming to a stop, over interlocker at Stettler, Alta.

15445. Nov. 22.—Approving revised location of Algoma Eastern Ry. and diversion of trunk road at mileage 34.75, with approval of Ontario Government.

15446. Nov. 22.—Authorizing Alberta Central Ry. to cross highway at mileage 10.10.

15447. Nov. 20.—Rescinding par. 1 of order 11812, Sept. 19, 1910, re expropriation by G.T.P.R. of M. Keilty's land, Edmonton, Alta.

15448. Nov. 7.—Ordering Napierville Jct. Ry. to build station at Delson Jct., Que., within two months with leave to occupy G.T.R. and C.P.R. lands which may be necessary to serve travelling public.

15449. Sept. 15.—Authorizing Winnipeg Electric Ry. to cross C.P.R. Selkirk branch on Selkirk Ave. and McPhillips St., interlocking plant to be installed.

15450. Nov. 21.—Ordering G.T.R. to build foot subway at Wilson and Norfolk Sts., Guelph, Ont., cost to be paid by city, and any dispute to be referred to the Board.

15451. Nov. 7.—Ordering C.P.R. to protect G.T.R. crossing, north of Woodstock, Ont., by interlocker.

15452. Nov. 24.—Rescinding order 15221, Oct. 27, re interlocker to be installed at Pages, Ont., by C.P.R. and G.T.R.

15453. Nov. 20.—Authorizing C.N.R. to cross with its Vegreville line 12 highways in Alberta.

15454. Nov. 18.—Authorizing C.N.O.R. to build across farm road and creek on lot 20, con. 2, Camden tp.

15455. Nov. 24.—Approving location and plans of C.P.R. station at London Yard, Ont.

15456. Nov. 22.—Ordering Atlantic, Quebec and Western Ry. to provide undercrossing for A. Shannon, Breche a Manon, Que.

15457. Nov. 25.—Relieving C.P.R. from further protection of crossing, 1¼ miles north of Brigham Jct., Que.

15458. Nov. 25.—Authorizing C.P.R. to build double track across highway near 1st Ave., Port Arthur, Ont.

15459. Nov. 25.—Approving Alberta Central Ry. location, mileage 194.6 to 220, east from Red Deer.

15460 to 15462. Nov. 25.—Authorizing James Bay and Eastern (C.N.R.) to cross three public roads in Demeules and Oulatchouan tps., Que.

15463. Nov. 25.—Ordering C.N.R. to complete draining cattle pass on Y at Ochre River, Man., before June 1, 1912, under penalty of \$10 a day.

15464. Nov. 24.—Relieving G.T.R. from further protection of crossing west of Burlington Jct., Ont.

15465. Nov. 24.—Substituting word "construct" for "reconstruct" in order 15116, Oct. 11, re bridge at Bull River Bridge on Kootenay Central Ry., B.C.

15466, 15467. Nov. 23.—Authorizing C.P.R. to build spur for Sovereign Lime Works, near Angus station, Montreal, and extend spurs for Manitoba Glass Mfg. Co. on s.e. ¼ sec. 36, tp. 12, r. 7, e.p.m.

15468 to 15470. Nov. 23.—Authorizing C.P.R. to build spur for city of Calgary, Alta., across road allowance and city's existing spur; also spurs for Gordon Nail Co., Calgary, Alta., and Austin and Nicholson, in tp. 37, Algoma District, near Brunel station, Ont.

15471. Nov. 25.—Authorizing C.P.R. to build double track across C.N.R. in Carberry, Man., at mileage 105.6 Brandon subdivision.

15472. Nov. 23.—Re C.P.R. switching rates at Prescott, Ont. This order is given in full on another page.

15473. Nov. 17.—Dismissing application of Canadian Freight Association for approval of proposed local freight tariff of charges for use of refrigerator cars west of Port Arthur.

15474. Nov. 25.—Suspending, sine die, tariffs of C.N.R. and Ottawa and New York Ry., re baggage of excess size until all parties can be heard.

15475. Nov. 24.—Ordering C.P.R. on or before Apr. 1, 1912, to maintain permanent station agent at Winnipeg Beach, Man.

15476, 15477. Nov. 27.—Authorizing Alberta Central Ry. to build bridges across Red Deer River at mileage 5.93 and North Saskatchewan River at Rocky Mountain House, mileage 61.5.

15478 to 15480. Nov. 27.—Authorizing C.P.R. to rebuild bridges 43.3 over Upper Lachine Road, Farnham subdivision near Rockfield, Que., and 18.8 and 19.1, Ottawa subdivision.

15481. Nov. 25.—Approving C.N.O.R. revised location at Stonehouse Lake, Storrington tp., mileage 174.67 to 175.35 from Toronto.

15482. Oct. 12.—Authorizing C.N.O.R. to build across public road between cons. 7 and 8, Georgina tp.

15483, 15484. Nov. 27.—Approving location of C.N.O.R. station grounds at mileage 174.5, Storrington tp., and at Chaffey's Locks, South Crosby tp.

15485. Nov. 27.—Authorizing C.N.O.R. to build spur to rolling mills across Bay St. Belleville.

15486. Nov. 27.—Authorizing G.T.P.R. to build across and divert highway in n.w. ¼ sec. 5, tp. 25, r. 10, w. 2 m., Sask.

15487, 15488. Nov. 27.—Relieving G.T.R. from further protection at crossings of Beach Road in East Hamilton, and at Pikes Side Road, 1¼ miles west of Strathroy station, Ont.

15489 to 15492. Nov. 25, 28.—Authorizing C.P.R. to build spurs for W. J. Riley, n.e. ¼ sec. 28, tp. 12, r. 9, e.p.m., mileage 20.1 Lac du Bonnet Branch, Man., Ontario and Manitoba Flour Mills, McKim tp., Stobie Branch near Sudbury, Ont.; amending order 15389, Nov. 14, re spur to Martin Lenour Co.'s premises, St. Boniface, Man., and authorizing spur for National Brick Co., LaPrairie, Que.

15493. Nov. 27.—Rescinding order 11264, July 18, 1910, re extending Brownlie St., Morse, Sask., over C.P.R., and authorizing C.P.R. to open and build Main St., over its line there.

15494, 15495. Nov. 27.—Approving change in location of C.P.R. station at St. Basil, N.B., and approving location of station at Westmount, Que.

15496. Nov. 28.—Authorizing C.N.O.R. to cross under C.P.R. at Smiths Falls.

15497, 15498. Nov. 27, 28.—Authorizing C.P.R. to build spurs for Imperial Oil Co., Wetaskiwin, and to ballast pit at Elcan, Alta.

15499 to 15505. Nov. 28.—Extending to June 1, 1912, time within which telegraph and telephone companies may charge tolls as

they were immediately previous to July 13, 1906.

15506. Nov. 28.—Relieving G.T.R. from further protection at crossing in Victoria-ville, Que.

15507. Nov. 28.—Ordering G.T.R. not later than Apr. 20, 1912, to build joint crossing between farms of J. A. Riddell and H. Dix, Williamsburgh tp., Ont.

15508, 15509. Nov. 27.—Ordering C.N.Q.R. to install gates at Joliette St. by July 1, 1912, 20% to be paid from railway grade crossing fund, and gates at Aylwin St., Montreal.

15510, 15511. Nov. 28, 20.—Authorizing G.T.P.R. to cross and divert highway at mileage 39.6 and 92.4, Sask.

15512. Nov. 29.—Correcting plan approved by order 12342, Nov. 21, 1910, in connection with centre line of G.T.P.R. Regina-Moose-Jaw branch.

15513. Nov. 30.—Authorizing G.T.P. Branch Lines Co. to cross and divert road at mileage 33, Sask.

15514. Nov. 30.—Authorizing G.T.R. to expropriate certain lands on east side of Elgin St. and north of Robert St., Hamilton, Ont.

15515, 15516. Nov. 30, 29.—Relieving G.T.R. from further protection at crossings in lot 11, Tecumseh tp., and about 2½ miles north of Cookstown, Ont.

15517. Nov. 30.—Authorizing C.P.R. to use bridges at mileage 65.7 and 87.2, Edmonton subdivision, Alta.

15518. Nov. 29.—Authorizing C.P.R. to build its Wilkie-Anglia branch across four highways in Saskatchewan.

15519. Nov. 30.—Authorizing C.N.R. to cross public road on its Prince Albert-Battleford line, Sask.

15520. Nov. 30.—Authorizing C.P.R. to cross with its Kerrobert Northeasterly branch, two highways at mileage 0.41 to 0.98.

15521. Nov. 27.—Ordering C.N.Q.R. to complete installation of gates at Nicolet St., Montreal, by July 1, 1912, 20% to be paid from railway grade crossing fund and 30% by the city.

15522. Nov. 29.—Authorizing C.N.R. to open for traffic its line from Warden to Drumeller, 63 miles.

15523. Nov. 29.—Authorizing C.N.R. to operate under Queen St. bridge, Toronto, until viaduct plans are settled.

15524. Nov. 29.—Authorizing Saskatchewan Public Works Department to build highway across C.P.R. between secs. 3 and 4, tp. 18, r. 32, w.p.m.

15525. Nov. 27.—Authorizing city of Sherbrooke, Que., to extend Meadow St. under G.T.R.

15526. Nov. 29.—Dismissing C.P.R. application to rescind order 605, July 25, 1905, re interswitching at London, Ont.

15527. Nov. 27.—Ordering C.N.Q.R., before Jan. 1, 1912, to submit plan for station in Maisonneuve, Que., station to be completed when Board directs.

15528. Nov. 30.—Authorizing C.N.O.R. to build bridge over Rideau canal at Chaffey's Locks.

15529. Nov. 29.—Authorizing city of Calgary, Alta., to build subway under C.P.R. at 9th Ave. east, between 15th and 17th Aves. east, 60% to be paid by city, and 40% by company.

15530. Dec. 1.—Amending order 14605, Aug. 17, which authorized Calgary and Edmonton Ry. to carry its main line over Edmonton, Yukon and Pacific Ry. in Edmonton, Alta., by a bridge, substituting Edmonton, Yukon and Pacific Ry. for applicant company.

15531. Dec. 1.—Amending order 15480, Nov. 27, by substituting rebuild for build.

15532, 15533. Dec. 1.—Approving revised location of C.N.O.R. Sudbury-Port Arthur line in Dorion tp., mileage 48.8 to 50.5 from Port Arthur; and at Pearl station, MacTavish tp., mileage 534.72 to 535.01 from Sudbury.

15534. Dec. 1.—Approving G.T.P.R. revised location from south line of sec. 3, tp. 52, r. 24, to west line of sec. 34, tp. 47, r. 28, w. 5 m., mileage 55.15 to 93.92.

15535. Dec. 1.—Authorizing G.T.P. Branch Lines Co. to cross with its Cutknife branch highways from s.e. ¼ sec. 36, tp. 43, to s.e. ¼ sec. 2, tp. 44, r. 17, w. 3 m., mileage 1.13 to 3, West Saskatchewan District.

15536. Dec. 1.—Authorizing city of Winnipeg to extend Sargent Ave. across C.P.R. Pembina branch.

15537. Dec. 1.—Amending order 15479, Nov. 27, by substituting rebuild for build.

15538. Sept. 14.—Naming express delivery and collection limits for Yorkton, Sask.

15539. Nov. 30.—Approving supplement 7 to Express Classification for Canada 2, in connection with order 15288, to take effect not later than Jan. 1, 1912.

15540. Nov. 25.—Ordering G.T.R. to amend Special Tariff on coal and coke from

Rouses Point, N.Y., not later than Jan. 15, 1912 so as not to exceed certain rates.

15541. Dec. 1.—Authorizing C.P.R. to build two spurs for Canadian Copper Co., Copper Cliff, Ont.

15542. Nov. 27.—Approving amended plan for protection where G.T.R. crosses Montreal Park and Island Ry. near Turcot, Que.

15543. Nov. 27.—General order 12542, Dec. 9, 1910, re blaugas, by striking out subsec. c, par. 1.

15544. Dec. 4.—Authorizing C.N.O.R. to cross C.P.R. for construction purposes only, at east side of Rideau River, near Ottawa, watchman to be appointed by C.P.R. and paid by C.N.O.R.

15545. Dec. 4.—Amending order 15344, Oct. 31, which approved standard plans for pile and frame trestles for C.N.R. eastern lines, by substituting Montreal-Port Arthur line for eastern lines.

15546. Dec. 2.—Ordering that \$5,000 be paid out of railway grade crossing fund towards cost of building subway under C.N.R. at 23rd St., Saskatoon, Sask.

15547. Dec. 1.—Authorizing G.T.R. to build spur into Twin Lake Lumber Co.'s premises, Parry Sound District, Ont.

15548. Dec. 2.—Authorizing C.P.R. to build bridge 1.43 over Kettle River, on Granby Smelter spur, B.C.

15549. Dec. 2.—Authorizing C.P.R. to build spur for Western Supply and Equipment Co., Calgary, Alta.

15550, 15551. Dec. 2, Nov. 30.—Authorizing C.N.O.R. to carry public road over its tracks on a structure at station 1131-3, Nipigon, Ont., and to cross creek at station 41-51, lot 22, Camden tp.

15552. Dec. 4.—Authorizing C.P.R. to build spur for G. R. Marnoch, Lethbridge, Alta.

15553. Dec. 1.—Authorizing C.P.R. to cross with its Quill Lakes branch, 29 highways in Manitoba.

15554. Dec. 4.—Authorizing G.T.R. to rebuild bridge 1, at milepost 8.06, District 30, Hawkesbury branch, Ont.

15555. Dec. 4.—Authorizing Niagara Welland and Lake Erie Ry. to cross G.T.R. spur, on Muir St., Welland, Ont.

15556. Dec. 2.—Approving location of C.N.O.R. station grounds at St. Hermas, Que.

15557. Dec. 4.—Authorizing C.P.R. to use bridges 21.7 and 22.5 on Moose Jaw subdivision, Sask.

15558. Dec. 5.—Ordering that flagman be maintained by C.P.R. at Talbot St., Winnipeg.

15559. Dec. 4.—Extending to Nov. 1, 1912, the time allowed under judgment for free return of empty packages by express companies prior to Mar. 1, 1911.

15560. Dec. 4.—Authorizing Noisy River Telephone Co. to erect wires across G.T.R. in Nottawasaga tp., Ont.

15561, 15562. Dec. 5.—Authorizing C.N.R. to cross with its Hallboro branch five highways in Manitoba and Saskatchewan, and to cross with its proposed second track, Pembina highway, Fort Rouge, Winnipeg.

15563. Dec. 4.—Approving plan of Spanish River Pulp and Paper Mills, Ltd., for tunnel under Algoma Eastern Ry. at Espanola, Ont.

15564. Dec. 6.—Authorizing C.P.R. to cross with its Regina, Saskatoon and North Saskatchewan branch, 32 highways and road diversion mileage 25.88 to 56.28, Sask.

15565. Dec. 6.—Authorizing G.T.P. Branch Lines Co. to operate spur from its Tofteld-Calgary branch into Calgary Collieries, Ltd.

15566. Dec. 6.—Authorizing C.P.R. to build spur into Jewell Lumber Co.'s premises, East Kootenay District, B.C.

15567. Dec. 6.—Authorizing C.N.R. to cross public road on its Prince Albert-Battleford line.

15568. Dec. 6.—Authorizing C.N. Pacific Ry. to cross under Esquimalt and Nanaimo Ry. near Parson's Bridge, B.C., and rescinding order 12695, Jan. 5, which authorized similarly.

15569, 15570. Dec. 6.—Authorizing C.P.R. to build spurs for Taylor Lumber Co., near Kimberley, B.C., and Rock Creek Lumber Co., East Kootenay District, B.C.

15571. Dec. 6.—Authorizing C.N.Q.R. to cross Montreal St., at Pius IX. Ave., Maisonneuve, Que., and to move deraill 14 ft. farther south.

15572. Dec. 7.—Ordering G.T.P.R. in addition to requirements of order of Sept. 9, to stop trains for passengers at King St., Entwistle, Alta., freight to be handled at sawmill siding, and to build highway northwesterly along Queens Ave. to Main St. and along Main St. to Second St. as shown on Station survey plans of Mar. 10 and Apr. 1, under penalty of \$100 a day in default.

15573. Dec. 6.—Authorizing C.P.R. to build spur for Robinson & Lequime Lumber Co., Ososyoos division, Yale District, B.C.

15574, 15575. Dec. 7, 6.—Authorizing C.P.R. to cross and divert highway on its Estevan-

Forward branch at mileage 4.183 and cross highway with its Swift Current branch at mileage 21.82, Sask.

15576. Dec. 6.—Approving C.N.R. plan of standard portable depot to be erected at Mountain, B.C.

15577. Dec. 6.—Authorizing C.P.R. to build bridge 108.6 on its Cascade subdivision, B.C.

15578. Dec. 9.—Recommending to Governor-in-council sanction of the lease between South Ontario Pacific Ry. Co. and C.P.R.

15579. Dec. 6.—Extending until Jan. 1, 1912, time within which G.N.R. rates be filed in accordance with order 15394, Nov. 14, re ashes for fertilizing purposes for W. H. Haight, Pipers Siding, B.C.

15580. Dec. 7.—Authorizing T.H. & B.R. to operate construction and freight trains across G.T.R. and Hamilton Radial Ry. pending installation of protection at spur to Crasell Chemical Co. authorized by order 15294, Nov. 7.

15581. Dec. 7.—Authorizing Cymri municipality to build road across C.P.R. one mile west of Halbrite, Sask.

15582. Dec. 11.—Amending order 15201, Oct. 11, to provide that M.C.R. gates at Queen St., Tilbury, Ont., be operated day and night.

15583. Dec. 9.—Amending order 15185, Oct. 20, re C.P.R. spurs by substituting Owen Sound for Sydenham tp.

15584. Dec. 11.—Authorizing Essex Terminal Ry. to use crossing at Windsor, Ont., with M.C.R. for construction purposes only for 60 days.

15585. Dec. 5.—Extending time for completion by G.T.R. of interswitching track at Ingersoll, Ont., to June 15, 1912, cost to be divided equally between G.T.R. and C.P.R., track scales to be furnished by town of Ingersoll and installed by C.P.R. in front of Ingersoll Nut Co.'s premises.

15586. Dec. 9.—Authorizing Esquimalt and Nanaimo Ry. to open for traffic its line from Cameron Lake, mileage 107.6 to Alberni mileage 135.

15587. Nov. 27.—Dismissing T. R. Smith's application for better train service from St. Lawrence and Adirondack Ry. (N.Y.C. & H. Rd.) between Highlands and Montreal, Que.

15588. Dec. 7.—Authorizing C.N.O.R. to build bridge across highway between lots 28 and 29, con. 4, station 1768.05, Darling-ton tp.

15589. Dec. 12.—Approving revised location of G.T.P. Branch Lines Co. Cutknife branch, mileage 1.13 to 3.0 West Saskatoon District.

15590. Dec. 13.—Approving correction in G.T.P.R. location of Moose Jaw northeasterly branch as approved by order 14005, June 20, 1911.

15591 to 15594. Dec. 13, 12.—Authorizing C.P.R. to rebuild trestle at bridge 5.1, Brandon subdivision, Man., to use bridges at mileage 49.1, 113.5, Cascade subdivision, B.C., 15.9 and 36.6 Cranbrook subdivision, B.C., and at 64.4, 131.7, 132.3 Esquimalt and Nanaimo Ry.

Passenger Rate Meetings at Detroit.

The Niagara Frontier Summer Rate Committee will hold its annual meeting at the Hotel Cadillac, Detroit, Mich. The representatives will meet on Jan. 17 and 18, at 9 a.m., and arrange details as far as possible, and their report will be submitted to the general meeting on July 19, at 11 a.m.

The Great Lakes and St. Lawrence River Rate Committee will meet at the same place on Jan. 19, immediately after the adjournment of the Niagara Frontier Summer Rate Committee's meeting.

The International Water Lines Passenger Association will meet at the same place on Jan. 18, at 4 p.m.

During Oct., 1911, 18 employees were killed and 38 were injured in the course of their work in the operation of Canadian railways, and six were killed and 11 injured in connection with railway construction. In the former case six deaths were due to being run over, four to collisions, three to being struck by trains, two to being crushed between cars, and one each to a derailment, to an explosion and to falling material; and in the latter, two deaths were due to premature explosions, two to suffocation in a cave-in, and one each to being run over, and to being struck by a train.

The Canadian Pacific Railway Terminal at Victoria Harbor.

By G. G. Ommanney, Resident Engineer, Canadian Pacific Railway.

The C.P.R.'s new Victoria Harbor terminal on the southern shore of Georgian Bay, now practically completed, is designed to be the eastern lake terminus of the new grain route of that system. This route has as its objective a reduction of mileage to the eastern distributing points, as compared with that of the present route by way of Owen Sound and Toronto. Shortening of the distance is effected both by a more direct steamship line from the western ports and by the construction of a new railway connecting Victoria Harbor with Montreal by way of Peterborough, so as to eliminate the southerly deviation to Toronto. Connection with the latter city will be maintained, however, on the Sudbury-Kleinberg branch by way of Coldwater Junction. A further considerable advantage over the old route will be gained in the greater trainloads made possible by the easier curves and gradients on the new road, which will nowhere exceed 4 deg. and 0.4 per cent. respectively.

THE SLIP AND GRAIN ELEVATOR.

The construction of the Victoria Harbor terminal embraces a slip 600 ft. wide and 25 ft. deep, flanked by parallel wharves, 3,000 ft. long on the one side and 3,600 on the other. The slip is approached by an entrance channel about half a mile long, the entire channel and slip having been formed by the removal of some 3,000,000 cu. yds. of soft material and 200,000 cu. yds. of rock by dredging. The location provides perfect shelter to vessels in all kinds of weather. This dredging has been carried out under Government supervision, the contractor, since the inception of the work in 1908, having been the Canadian Dredge and Construction Co., with whom was associated up to 1910 the Owen Sound Dredging Co. The dredging plant has consisted, during the most of the time, of three large dipper dredges, handling from 2,000 to 5,000 cu. yds. per day, with attendant hopper scows and a large rock-drilling plant. The output of this dredging plant while working in rock has been from 400 to 600 cu. yds. per day.

On the east side of the slip there has been constructed a 2,000,000 bush. grain elevator, unloading from vessels by means of two movable marine towers, each having a leg capacity on the dip of 20,000 bush. per hour. The grain can be elevated and distributed to any

place, about three-quarters of a mile long, before construction could be started. This trestle was subsequently filled from trains. Work on the elevator started in May, 1909, and the plant was handling grain in the fall of 1910.

METHOD OF BUILDING THE ELEVATOR.

About 30,000 cu. yds. of concrete were

raised as the work proceeded, by means of screw jacks operating on threaded rods extending the full height of the bin walls. The work was thus continuous, the actual time of construction of the full height of 80 ft. of the bin walls being somewhere less than six weeks.

The two movable marine towers, the

Layout of Elevator, etc., on Maple Island.

placed in the construction of this elevator and the wharf in front of it, the latter being 800 ft. long. Material for concrete was brought in by train, unloaded from centre-dump Hart cars into a belt conveyor, which carried it to a screening and washing plant. This plant was furnished with stone and sand storage bins, from which the material could be delivered to any one of four pairs of feeding bins located immediately over the concrete mixers. The mixers dumped into hoist buckets, which elevated the concrete to any required height, whence it was conveyed by buggies to the forms, the haul nowhere exceeding 200 ft., except in the case of the wharf. This method of handling the material proved remarkably successful, the only trouble encountered being due to the installation of canvas conveyor belting at the commencement of work, which proved unable to withstand the excessive wear and tear, and was replaced during the progress of the work by rubber belting.

All of the storage units of the ele-

cupola of the working house and the remainder of the superstructure of the elevator are of structural steel.

The power installation for the elevator consists of two 500 k.w. turbo-generators, developing 3-phase, 60 cycle, 600-volt alternating current. Steam is derived from four Babcock and Wilcox water-tube boilers of 250 h.p., fitted with automatic chain grate stokers. The various conveyors and elevators are run by line shafts operated by individual motors.

The wharf in front of the elevator has a gravity section concrete wall, 800 ft. long, founded on the limestone rock. It was constructed in a trench excavated dry behind an earth cofferdam built from the material removed from the foundations. The original depth of water on the site of the dam was only 2 or 3 ft. The situation was favorable for this form of construction, and the leakage was all taken care of by two 4 in. centrifugal pumps. Foundation level of the wharf was 26 ft. below the water level.

General Plan of Terminals showing Present Structures and Proposed Extensions.

part of the storage house or to the working house, after weighing, whence it can be loaded into cars which are automatically fed through the track sheds by car pullers.

The site of the elevator was formerly an island, which had to be connected with the mainland by means of a tres-

tis, the elevator consist of concrete bins having 8 in. walls reinforced with continuous spiral $\frac{3}{4}$ in. steel rods. The joints are connected in each case by means of hooks and a link, a wedge being inserted for tightening. Forms were erected over the whole area of the bins to a height of 3 ft., and were simultaneously

FREIGHT AND FLOUR SHEDS.

On the west side of the main terminal slip a flour shed 800 by 89 ft. wide has been erected, and a freight shed 704 by 71 ft. The flour shed is constructed of steel columns and roof girders, with continuous sliding doors on both wharf and track sides. Concrete end walls and

fire walls are provided, and the flooring is of 2 in. pine. The floor is at car-door level on the track side, and the wharf is 4 ft. above water level.

The freight shed is a timber structure having two loading tracks running through it on either side of an 11 ft. trucking platform. Continuous sliding doors open on the wharf, the level of which is 4 ft. above water level. Track doors are provided at the entrance end. A concrete fire wall is in the middle, and office accommodation in one end.

The whole of the site of these sheds was filled with sand dumped from trains after the wharf had been built, and piles were driven for the foundation, all of them being cut off below water level. The wharves at the front of the sheds were constructed of cribs, with concrete tops above water level, each crib unit being 108 ft. long 24 ft. high and 24 ft. wide at the base. The front and cross walls of the cribs were composed of 2 in. hemlock securely nailed with $4\frac{1}{2}$ in. nails, the whole being built on the wooden bin principle. These walls rested on timber sills. Flotation of the lumber was overcome by means of long vertical $1\frac{1}{2}$ in. rods connecting timbers spanning the crib walls at various levels. The crib was divided into pockets, every alternate pocket having a solid 2 in. floor to contain the filling necessary for sinking it into place.

METHODS OF PLACING WHARF CRIBS.

The operation of building cribs was continued during both winter and summer. In the summer the sills for a crib were first built on a raft, from which the crib was readily launched when the walls had reached a height inconvenient for further construction. By placing the sills on well greased pine skids on the raft, the launching could be readily effected without the use of mechanical power. Sand filling for the cribs was deposited along the shore by trains, and was wheeled out by barrows along floating runways. About 100 cu. yds. was required to insure the stability of each crib before back filling could be started.

In the winter the site for a crib was first cut out of the heavy ice, which is

tion was started. The time taken to build and sink one crib averaged nine days. The filling consisted entirely of sand, which was supplied by train filling after the crib had been sunk into its final position.

In addition to the principal structures mentioned, the C.P.R. is building a

first hundred miles ran through a deep swamp and so on. In consequence of these representations, the Government decided not to allow the work to go on until there had been an investigation. There will be no further delay in construction than is absolutely necessary to check up the surveys.

Flour Shed at Victoria Harbor, Ont.

roundhouse, turntable, coaling plant, ice house, general offices, stores, passenger station and other buildings. All the necessary filling and grading of the large terminal yard has been done by trains.

The design of the elevator and its power plant, and details for the $1\frac{1}{2}$ miles of wharves, were prepared by the John S. Metcalf Co., Ltd., Montreal, which was also the contractor for the flour and freight sheds and the wharf construction. The flour and freight sheds were designed by the C.P.R. engineering department, the building details being worked out by the contractor. The writer was resident engineer in charge of construction.—Engineering Record.

Since the foregoing was put in type the name of Victoria Harbor has been changed to Port McNicoll in honor of D. McNicoll, Vice President, C.P.R.

The Railway to Hudson Bay.

A resolution was passed by the House of Commons, Dec. 4, directing a return giving all papers, correspondence and orders-in-council in connection with the awarding of the contract for the building of the railway to Hudson Bay, and of all orders suspending work on the same. The Minister of Railways said

Ottawa press reports Dec. 14 state that the Dominion Government has under consideration a proposition for the extension of the projected line westward from Pas Mission, the present starting point of the line, westerly through Melfort to Saskatoon, Sask. The Chief Engineer in charge of the work at Winnipeg, J. Armstrong, has been in Ottawa, conferring with the Minister of Railways in connection with the entire project.

Further reports from Ottawa state that the result of the hydrographic survey of the waters of Hudson Bay, made by the steamer Stanley, are now under consideration, and it is reported that the survey shows that vessels of special construction will be necessary to navigate the bay, owing to the prevalence of ice, and that Fort Churchill will provide a better harbor than Port Nelson, notwithstanding the fact that the entrance is narrow. The water is very shallow at Port Nelson, in fact only 24 ft. was found, with the shore out of sight. (Dec., 1911, pg. 1129.)

Oil Burning Locomotives for the C.P.R.

As stated in previous issues, crude oil is to be used for fuel for C.P.R. locomotives between Field and Kamloops, B.C., and tanks of 200,000 galls. capacity are to be built at seven places in that territory. We are now officially advised that 76 locomotives are to be converted to oil burners as follows:—

41 class N-3, cylinders $23\frac{1}{2}$ by 32 ins., driving wheels 63 in. diameter.

16 class D-9, cylinders 21 by 30 ins., driving wheels 63 ins. diameter.

6 class R-1 Mallet compounds, cylinders 23 and 32 by 26 ins., driving wheels 58 ins. diameter.

13 small locomotives of various classes.

The mechanical department is getting information as to the types of oil burners in use on other lines before deciding on what type will be adopted. The oil burning equipment and oil tanks will probably be built at the Angus shops, Montreal, and shipped to the west for application to the locomotives.

It is not contemplated at present to build any new locomotives specially for burning oil, but it is possible that five now under construction by the Montreal Locomotive Works may be changed over for oil burning.

The Halifax and South Western Ry. has been ordered to pay \$1,950 damages for loss of a house and barn by fire, due to sparks from a locomotive setting fire to dried grass, etc., along its right of way.

The Quebec branch of the Canadian Society of Civil Engineers at its annual meeting, Dec. 6, elected W. D. Baillairge Chairman, and A. Amos, Secretary for the current year. Various questions affecting navigable rivers were discussed, and the meeting concluded with a social entertainment.

Canadian Pacific Railway Elevator at Victoria Harbor, Ont.

often 27 in. thick at Victoria Harbor, and the hole then allowed to freeze thick enough to bear the weight of the sills. These were laid out on the thin ice and the building of the walls was continued.

The work of dredging on the crib sites was very carefully done, and close soundings taken before any construc-

there was no change in policy in reference to the building of the line, and the Government would fulfil the promises made in respect to it when in opposition. Representations had been made to the Department that the line did not start from the right point, that the surveys were not correct, that the

Grand Trunk Railway Construction, Betterments, Etc.

New England Plans.—The Providence, R.I., city council has passed an ordinance granting the southern New England Ry. the right to lay tracks along the west side of Providence River.

Application is being made by E. H. Fitzhugh to the Vermont Legislature for a charter to build a railway from Barre to Williamstown, under the title of the Barre Granite Ry. The matter will come before the Public Service Commission Jan. 8. It is proposed that the new railway connect with the Montpelier and Wells River Rd. It is said Barre will be made the headquarters of the new road if the project materializes.

The question of the union railway station at Burlington, Vt., came before the Public Service Commission Dec. 5, but its decision has not been announced.

General Betterments.—During the past year the G.T.R. is reported to have completed the following betterments: overhead bridges at Brighton, Oshawa, Scarboro, Groveton, Grimsby, Mallorytown and Palmerston, Ont.; subways, East Brighton, Vt., Pownal and Cobourg, Ont.; new stations at Cobourg, Guelph, Sarnia Junction, Brule Lake, Thorndale, Wyebidge, Hepworth, Maxville, Dublin, Ont., and Beloeil, Chaudiere Jct., and Beauharnois, Que.; new freight sheds at Cobourg, Paris, Junction, Glencoe and Bowmanville, Ont., and West Detroit, Mich., also a fruit shed at Detroit, Mich. large locomotive house at Tiffin, Ont. Coal chutes at Ottawa, Ont., and Elsdon, Ill. Y.M.C.A. buildings at Port Huron, Mich., and Elsdon, Ill.

Richelieu River Bridge.—The G.T.R. is renewing the bridge across the Richelieu River, near Lacolle, Que., formerly part of the Canada Atlantic Ry. The existing draw span is a steel structure 186 ft. over all, and is to be replaced by a new steel swing 250 ft. over all, having a capacity of E-50, loading. The new bridge will afford two channels of 97 ft. each, in the clear. The present pivot pier is octagonal in shape, and is of concrete on a grilled flooring resting upon piles. This pier is to be replaced by a new one, square in shape, and enlarged to meet the new conditions. The pier will be built solid from the river bed up. The rest piers at present are of concrete, supported on piles, but they are to be taken down and replaced by new concrete piers enlarged to meet the special circumstances. The present approaches to the draw on either side are composed of pile bents for an aggregate length of 850 ft. This pile work is to be replaced by 12 deck plate girders resting on new concrete piers, which will be placed 60 ft. apart, centre to centre. The rail level at the bridge is to be raised 3½ ft. to accommodate the new superstructure. The John S. Metcalf Co., Ltd., Montreal, has the contract for the substructure, at a cost of about \$140,000. The superstructure is to be built and erected by the Dominion Bridge Co. This work is under the supervision of H. R. Safford, Chief Engineer of the G.T.R. system.

Winter Warehouse at Montreal.—The G.T.R., which has rented the Donaldson shed at the wharf for the winter, is reported to have laid a track along the revetment wall, to facilitate the handling of freight thereto.

Humber Bridge.—One of the abutments of the newly built bridge over the Humber River, a part of the Toronto Lake Shore improvement showed signs of settlement after having been completed, and traffic was suspended. The abutment was temporarily reinforced, and traffic was resumed Nov. 23, on the northern tracks. There has been no further sign of settling, and the engineers believe that a solid bottom has

been found by all parts of the abutment. The total settlement was about four inches.

Hamilton.—The Board of Railway Commissioners has authorized the company to expropriate certain lands in Hamilton, Ont., on the east side of Elgin St., and north of Robert St.

Guelph Subways, etc.—The Board of Railway Commissioners has directed the company to build a subway for foot passengers at Wilson and Norfolk streets, Guelph, Ont., the cost to be paid by the city.

Stratford Station and Yards.—The Stratford, Ont., city council has under consideration plans showing the location and the details of the proposed new station, and rearrangement of the yards. The city is asked to approve the plans before they are submitted to the Board of Railway Commissioners. The foundations of the new station building have been laid.

London Improvements.—A manufacturing firm in London, Ont., is reported to have been notified by the G.T.R. that the site of its factory may be required for the projected improvements in that city, and that its lease, which expires within two years, cannot be renewed. Other firms occupying G.T.R. property are reported to have received similar intimations.

Bay City, Mich.—U.S. press reports state that the company has secured the last of the property needed at Bay City, Mich., for its proposed terminal station and yards. The new work, it is stated, will cost about \$1,000,000.

A Record Run on the Michigan Central Railroad.

W. C. Brown, President, and other officials travelled on a special train from Suspension Bridge, N.Y., to Windsor, Ont., on Nov. 9, making what is believed to be a record run. We were unable to obtain the official record in time for our last issue, but it is not too late to be of great interest now.

The train, which consisted of three modern official cars and one modern combination coach and baggage car, left Suspension Bridge at 8.49 a.m., arrived at Montrose at 9.02 a.m., where engines were changed and one of the large Pacifics put on, left Montrose 9.05 a.m., arrived at Welland at 9.18 a.m., left there at 9.23 a.m., delayed five minutes on account of a boat passing through Welland drawbridge, arrived at St. Thomas at 10.49 a.m. without stop, left St. Thomas 10.51½ a.m., arrived at Windsor at 12.23½ p.m. without making a stop. The distance from Welland to St. Thomas is 100 9-10 miles and the run was made in 86 minutes. The distance from St. Thomas to Windsor station is 109 62-100 miles and this distance was covered in 92 minutes.

In regard to the foregoing an officer writes us:—"Considering the size of the train, I think this is the fastest run that has ever been made between Welland and Windsor and that it will be found equal to, if not better than, long distance fast runs on other railways for similar distances, in view of the fact that it was necessary to change engines at St. Thomas."

Press reports in England, which state that the Dominion Ex. Co. is now operating over the Canadian Northern line, are apt to be somewhat misleading. The facts are, that the Canadian Northern Ex. Co. is not at present soliciting business in Great Britain, and that the Canadian Northern Ex. Co. and the Dominion Ex. Co., are operating jointly on the Royal Line, owned by the Canadian Northern Steamships, Ltd.

Canadian Northern Railway Earnings, Expenses, Etc.

Gross earnings, working expenses, net profits, increase or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Earnings.	Net Increase
July \$1,475,900	\$1,114,300	\$361,600	\$13,400
Aug. 1,420,000	1,105,900	314,700	51,700
Sept. 1,576,400	1,157,000	419,400	38,200
Oct. 2,028,900	1,348,500	680,400	99,900
\$3,501,800	\$4,725,700	\$1,776,100	\$203,200
Inc. 1,276,000	1,072,800	203,200	

Approximate earnings for November, \$2,001,500, and for two weeks ended December 14, 1911, \$985,400, against \$1,565,400 and \$621,100 for same periods 1910.

The mileage operated during October 1911, was 3,731 against 3,304 during October 1910.

Canadian Pacific Railway Earnings, Expenses, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Profits.	Net Increase
July \$9,661,818.14	\$5,958,789.81	\$3,703,028.33	\$218,408.74
Aug. 10,421,904.42	6,346,333.41	4,075,571.01	383,886.65
Sept. 10,019,084.97	6,131,638.17	3,917,446.80	5,847.16
Oct. 11,207,991.99	6,526,887.24	4,681,104.75	175,944.23

\$11,340,799.52	\$24,063,648.63	\$16,377,150.89	\$784,098.81
Inc. 3,671,669.09	2,875,750.28	784,098.81	

Approximate earnings for November, \$9,202,000, and for two weeks ended December 14, \$5,000,000, against \$8,543,000 and \$5,000,000 for same periods 1910.

The mileage operated was increased during November to 10,809.

Grand Trunk Railway Earnings, Expenses, Etc.

The following figures show the earnings and expenses of the G.T.R., C.A.R., G.T. Western Ry. and D.G.H. & M.R., for Oct., as compared with those for Oct., 1910:—

GRAND TRUNK RAILWAY.			
	1911.	1910.	
Gross earnings	\$3,455,265	\$3,251,700	
Expenses	2,542,870	2,331,300	
Net earnings	\$ 912,395	\$ 920,400	
CANADA ATLANTIC RAILWAY.			
	1911.	1910.	
Gross earnings	\$ 206,488	\$ 203,800	
Expenses	177,268	157,800	
Net earnings	\$ 29,220	\$ 46,000	
GRAND TRUNK WESTERN RAILWAY.			
	1911.	1910.	
Gross earnings	\$ 581,478	\$ 542,500	
Expenses	444,631	464,300	
Net earnings	\$ 136,847	\$ 78,200	
DETROIT GRAND HAVEN AND MILWAUKEE RY.			
	1911.	1910.	
Gross earnings	\$ 228,403	\$ 201,900	
Expenses	168,989	150,300	
Net earnings	\$ 59,414	\$ 51,600	
Approximate earnings for Nov., \$4,101,244, and for two weeks ended Dec. 14, \$1,822,778, against \$3,845,640 and \$1,664,288 for same periods 1910.			
TRAFFIC RECEIPTS OF THE SYSTEM.			
Aggregate from July 1 to Nov. 30, 1911:—			
	1911.	1910.	
Grand Trunk Ry.	\$3,482,803	\$3,095,556	
Canada Atlantic Ry.	194,324	173,608	
Grand Trunk Western Ry.	575,197	501,754	
Detroit, Grand Haven and Milwaukee Ry.	210,634	178,103	
Totals	\$4,462,958	\$3,949,021	

The Windsor, Ont., court of revision has confirmed an assessment of \$2,500,000 upon the section of the Detroit Tunnel owned by the Michigan Central Rd., situated in Canada.

Running Rights on the T. and N.O. Ry.—Application is being made to the Dominion Parliament to confirm an agreement made Dec. 1, 1911, between the G.T.R. and the Temiskaming and Northern Ontario Ry. Commission providing for the joint use of the T. and N.O.R. between North Bay and Cochran, Ont., and authorizing the G.T.R. to operate its trains over the T. and N.O.R. from near Nipissing Jct. to North Bay.

RAILWAY DEVELOPMENT.

Projected Lines, Surveys, Construction, Betterments, Etc.

Alberta Central Ry.—The Board of Railway Commissioners has authorized the building of a bridge over the Red Deer River at mileage 5.93, and across the North Saskatchewan River at Rocky Mountain House, mileage 61.5. It has also approved location plans for the line from mileage 194.6 to 220 from Red Deer. (Dec., 1911, pg. 1137.)

Alberta Pacific Ry.—The Alberta Legislature is being asked to extend the time for the building of the line authorized by chap. 48 of the statutes of the second session of 1910. Boyle, Parlee and Co., Edmonton, Alta., are solicitors for applicants. (Sept., 1911, pg. 853.) 1911, pg. 853.)

Algoma Central and Hudson Bay Ry.—The Minister of Railways has approved a revision of the route map of the extension from mileage 83.80 to the junction with the National Transcontinental Ry.

Algoma Eastern Ry.—Application is being made to the Dominion Parliament for an extension of time within which the line from Meaford to Owen Sound may be built, and also for the building of various branch lines connecting the line from Sudbury to Little Current (completed or under construction) with Owen Sound, to Lake Timagami, to Lake Superior between Michipicoten Harbor and Batchawana Bay; from Bowell tp. to McLennan tp.; to the C.P.R. near Onaping or Cartier stations, and from Drury or Hyman tp. to Sudbury.

The Board of Railway Commissioners has approved revised location plan for a portion of this line, and, subject to the approval of the Ontario Government, the diversion of the trunk road at mileage 34.75.

During 1911 the company laid track as follows:—Espanola village northerly to Spanish River, 4.60 miles, and from Espanola village southerly to mileage 50.50 from Sudbury 1.50 miles. It has under contract an extension from Crean Hill to Little Current, on Manitoulin Island, 61.77 miles. This is covered by two contracts, both of which are held by the Superior Contracting Co., Espanola, Ont. The work on the mainland is reported to be pretty well finished, with the exception of a rock cut north of Whitefish. The grading is completed to Goat Island, across which the line is being located. Soundings are being made of the channel between Goat Island and Little Current in order to determine the exact location of the bridge. Bridge work is being proceeded with at the crossing of the Spanish River, and at the crossing of the C.P.R. at Nairn Centre. (Oct., 1911, pg. 935.)

Athabasca Valley Ry.—Application is being made to the Alberta Legislature to incorporate a company with this title to build a line from near Independence, on the Edmonton, Dunvegan and British Columbia Ry.'s projected line, or from near Edmonton, northwesterly to Fort Assiniboine, on the Athabasca River. C. A. Grant, Edmonton, Alta., is solicitor for applicants.

Press reports from Edmonton state the J. D. McArthur interests, which recently acquired the Edmonton, Dunvegan and British Columbia Ry. charter, are behind this project, and that the provisional directors will include J. D. McArthur, J. K. McLellan, R. A. Hazleton, D. W. Campbell, and W. P. McDougall, all of Winnipeg. (See also Edmonton, Dunvegan and British Columbia Ry.)

Atlantic Quebec and Western Ry.—We are advised that tracklaying has been completed, and that its total mileage from New Carlisle to Gaspé, Que., is 102.5. During 1911 track was laid

from Barachois to Douglastown, 20.5 miles, thus connecting up work previously done. (Dec., 1911, pg. 1137.)

British Columbia and Alaska Ry.—The British Columbia Legislature is being asked to amend sec. 3, chap. 56, of the statutes of 1910, by changing the location of one of the lines authorized. This is to be accomplished by striking out all the words after Columbia in line 10, and substituting the proposed new location: from Fort George northeasterly via Fort McLeod to the Parsnip River, thence to Peace River, to Finlay River, through Sifton Pass, and down the Stikine River to Telegraph Creek; with branch lines through the Pine or Peace River passes to the eastern boundary of British Columbia; or in the alternative by way of Lytton and Teslin Lake; and a line from some point on the main line to Vancouver. An extension of line for the building of the previously authorized lines is also asked. Robertson and Heisterman, Victoria, are the solicitors. (Nov., 1911, pg. 1035. See British Columbia and Dawson Ry. and B.C. Ry. and Development Co., Sept., 1911, pg. 858.)

British Columbia and Dawson Ry.—The Dominion Parliament is being asked to authorize the company to build branch lines following the same routes as those which the B.C. and Alaska Ry. is applying to the B.C. Legislature for authority to build. The only additional information contained in the B.C. and D. Ry. application is that the starting point of the line to Vancouver will be between Ashcroft and the entrance of Big Creek into the Fraser River. (July, 1911, pg. 645. See British Columbia and Alaska Ry. and B.C. Ry. and Development Co., Sept., 1911, pg. 858.)

Burrard Inlet Tunnel and Bridge Co.—E. Crutwell, the British engineer representing Sir J. W. Barry, Consulting Engineer for the municipalities interested in the building of this bridge, left Vancouver, B.C., for Ottawa, recently, to consult with the Department of Railways on the plans. The principal question involved is that of the draw span, which it is thought will be one of 250 ft. in order to provide adequate accommodation for vessels. The completed plans are expected early in the New Year.

The report of E. Crutwell, the English consulting engineer, was laid before the directors, Dec. 11, and a resolution adopting the plan providing for a bridge accommodating a single track steam railway, a double track electric railway, with roadway and sidewalks, was passed. The plan also showed the approaches with a double track steam railway. The estimated cost of the structure was put at \$2,125,000. The directors were told that after a consultation with the engineers of the Department of Railways at Ottawa, Mr. Crutwell was informed that the Government would consent to the opening span being reduced to 200 ft. wide. Copies of the report are being sent to the municipalities interested, with a request that they consider the desirability of providing increased subsidies to meet the extra cost of the bridge—the original estimate having been \$1,250,000. On Dec. 14 the directors waited on the Provincial Government, and the Premier promised favorable consideration to the request for increased assistance, but advised the company to make sure that the plan adopted would provide amply for the future. The Dominion Government will also be asked for an increased subsidy, the one at present available being in favor of the Vancouver, Westminster and Yukon Ry. Co., which is associated with the B.I.T. and B. Co. (Dec., 1911, pg. 1137.)

Cumberland Ry. and Coal Co.—A. Dick, General Sales Agent of the Dominion Coal Co., which now owns the C.R. and C. Co., is reported to have stat-

ed, Dec. 4, that if the Dominion Government will extend the Intercolonial Ry. to the waterfront at Wallace, N.S., about three miles, the company will expend about \$250,000 in establishing wharves, etc., there. This would enable the company to have direct access to the St. Lawrence River as its own railway runs from Springhill on the I.R.C. to the Bay of Fundy. The people of Wallace are reported to have offered to provide a right-of-way for the branch line.

Delaware and Hudson Co.—The Board of Railway Commissioners has ordered the Napierville Jct. Ry., one of the company's lines in Canada, to build a station at Delson Jct., Que., at once, with leave to occupy lands belonging to the G.T.R. and the C.P.R., which may be necessary. (Oct., 1911, pg. 935.)

Dominion Atlantic Ry.—We are advised that it is not likely the construction of the projected North Mountain Branch will be started until sometime late this year or until 1913. The proposed branch will start at Centreville, on the Cornwallis Valley branch, and will run westerly to Weston, N.S., between 14 and 15 miles. The location plans of the first five miles from Centreville to Lakeville have been approved by the Board of Railway Commissioners, and the remaining mileage is under survey. (Dec., 1911, pg. 1137.)

Edmonton, Dunvegan and British Columbia Ry.—The Minister of Railways has approved the route map of this projected railway from Edmonton to Dunvegan, Alta., via Lesser Slave Lake. The route for the entrance into Edmonton has not yet been presented for approval. (See Edmonton to Peace River, Oct., 1911, pg. 925; see also Athabasca Valley River.)

A press report states that a contract has been let to G. H. Webster for grading on this projected line from Edmonton, towards Dunvegan, and the Peace River country. It is further reported that the location surveys for the first 40 miles northwesterly from Edmonton have been completed.

Halifax and Eastern Ry.—Negotiations are reported to be in progress for the purchase by the Dominion Government of about a quarter of a mile of water frontage from the Intercolonial Ry. at Dartmouth, N.S., to the ferry, for terminal purposes for the H. and E.R. The price of the properties included in the area is said to be about \$100,000. The construction of the H. and E.R. was authorized by the Dominion Parliament, and contracts were let by the late Government for building it. (See Intercolonial Ry., Nov., 1911, pg. 1035.)

High River, Saskatchewan, and Hudson Bay Ry.—The municipal council of High River, Sask., passed a resolution Dec. 7, asking the Provincial Government to guarantee the company's bonds for \$13,000 a mile. (Nov., 1911, pg. 1035.)

Intercolonial Ry.—Press reports recently stated that a new branch line had been opened for traffic from Ferrona Jct. to Sunny Brae, N.S. We are officially advised that no new branch line has been opened, but that the Dominion Government has bought and is operating its trains over the line between Ferrona Jct. and Sunny Brae, which was formerly owned and operated by the Nova Scotia Steel and Coal Co.

A very full description of the new deep water terminal at Halifax, with plans, etc., will be found in the Marine Department on later pages of this issue.

Replying to questions in the House of Commons, Nov. 29, the Minister of Railways said the contract for the building of the new branch of the I.R.C. from Sunny Brae to Guysboro and from Guysboro and County Harbor to Melrose, had been awarded by order-in-

council dated Oct. 2 to the Nova Scotia Construction Co. The estimated cost of construction on schedule prices was \$1,057,122.19. The contract for the building of the branch from Dartmouth to Deans Settlement, to connect with the first mentioned line, was awarded by order-in-council dated Oct. 2 to M. P. and J. T. Davis, Ottawa, the estimated cost of construction on schedule prices being \$1,940,277.98. The contract for this branch had not been signed. On Nov. 30 the Minister stated that the question of going on with the construction of the Guysboro branch was under consideration. For the proposed spur line at Hampton, N.B., only one tender was received, and this had not been dealt with. It was not the Government's intention to proceed with the building of this spur at present. Offers had been received for the building of the branch line from Estende to Baddeck, in Cape Breton, but no contract has been let, and the Minister of Railways informed the House of Commons, Nov. 30, that it was not intended to proceed with the building of the line at present.

The Minister of Railways informed the House of Commons, Dec. 7, that P. S. Archibald, M. Can. Soc. C.E., Chief Engineer of the I.R.C. up to 1896, had been engaged by the department to report on the proposed branch lines above referred to.

Tenders were received to Dec. 26 for the building of a brick freight shed at Truro, N.S. (Dec., 1911, pg. 1137.)

Essex Terminal Ry.—The Board of Railway Commissioners has authorized the company to use for construction purposes only for 60 days from Dec. 11, 1911, its crossing of the Michigan Central Rd. at Windsor, Ont. (Dec., 1911, pg. 1137.)

Joliette and Lake Manuan Colonization Ry.—The British Canadian Construction Co., which is reported to have entered into a contract for the building of this railway from Joliette to Lake Manuan, Que., has its head office at Ottawa. We have ascertained that construction is in progress about 12 miles out from Joliette, O'Reilly, of Ottawa, representing the contractors, and that — Sims, St. Felix de Valais, Que., is also on the work. Some time ago the engineer in charge of surveys, etc., was J. N. Paton, who came from England to take charge. (Dec., 1911, pg. 1139.)

Kaslo and Slocan Ry.—We are advised that a portion of this line, formerly owned by the Great Northern Ry. (U.S.A.) has been operated since Sept. 15 by its new owners, under the original title. The mileage operated extends from Kaslo to Sproule, B.C., 15 miles. Beyond Sproule a fire destroyed the bridges and did considerable damage to the track. The company has not yet decided as to the restoration of the destroyed mileage. (Nov., 1911, pg. 1035.)

Kettle Valley Lines.—Application is being made to the Dominion Parliament to authorize the building of a branch from Vernon, southerly and southeasterly to Penticton, B.C., and to extend the time within which the company may build lines previously authorized.

Press reports state that surveys are being made along Five Mile Creek in the Similkameen Valley for an alternative route. From the mouth of Five Mile Creek, the survey will extend along the Similkameen River to East Princeton, Princeton, Coalmount, then through the Otter Valley to the head of the Coldwater River, to which point steel has been laid from Merritt.

During 1911 the company laid track on the following sections under construction from Midway to the Fraser River, B.C.; from Midway to Westbridge, 25 miles, and from Merritt to Coldwater Summit, 30 miles. The line between Westbridge and Coldwater Summit is being built by L. M. Rice and Co., whose construction headquarters are at Penticton, B.C.

The Spokane and British Columbia Ry., which is the title of a charter held by the company in the U.S., has under survey a line from Republic, the present southerly terminus of the line, to Spokane, Wash., 140 miles. (Dec., 1911, pg. 1139.)

Knee Hill Ry.—Application is being made to the Alberta Legislature for an extension of time for the building of the railway authorized by chap. 27 of the statutes of 1907; making certain changes in the provisional directors, authorizing an extension easterly to the Red Deer River, near the mouth of Knee Hill Creek, Three Hills Creek or Rosebud Creek, and to Calgary; and authorizing the company to enter into agreements with any other railway to be constructed to or across the Red Deer River. It is also proposed to change the name to the Calgary, Carbon and Red Deer Ry. Co. Duncan, Stuart and Warner, Calgary, are the solicitors. (See Calgary and Knee Hill Ry., Aug., 1909, pg. 573.)

Ladysmith Lumber Co.—We are advised that the logging railway which is being used by the Vancouver-Nanaimo Coal Mines Co., is the one built by the Ladysmith Lumber Co., under the charter of which company any extensions will be built.

The L.L. Co. was incorporated by the British Columbia Legislature in 1908, with power to build and operate for twelve years a line from 500 miles north of the Comox wagon road on the Esquimalt and Nanaimo Ry. to the old East Wellington right of way and northwesterly for two miles beyond the Government gazetted wagon road in the Mountain district, with branch lines. (See Vancouver and Nanaimo Coal Mines Co., Dec., 1911, pg. 1141.)

London and Port Stanley Ry.—It is said that the Lake Erie Coal Co. has under consideration plans for submission to the London, Ont., city council, which owns the L. and P.S. Ry., for electrifying the line. The proposition is that the company shall electrify the line, receiving in return the right of running freight trains, the city operating passenger cars. The city would also have the right of granting running rights over the line to other companies. It is said that the proposition will come up for discussion at the annual meeting. (Dec., 1911, pg. 1139.)

Lotbiniere and Megantic Ry.—See Quebec Eastern Ry.

Michigan Central Rd.—The cantilever bridge across the Niagara River, which is owned by the Niagara River Bridge Co., a subsidiary of the M.C.R., was opened in 1883, and is 910 ft. long, with a span of 47.0 ft. between the towers, and is 200 ft. above the level of the river. It is used exclusively for railway traffic. For some months past considerable work has been done in the way of building piers, etc., at the approaches on both sides of the river, and press reports state that all this has been done in preparation for the building of a new bridge. The same reports further state that the plans for the superstructure have been prepared, and that it is expected work will be started upon it during the current year or early in 1913. On July 3, 1911, we were officially advised that press reports to the effect that the company contemplated replacing the bridge were incorrect, as it was in good condition. (Dec., 1911, pg. 1139.)

An officer at Detroit, Mich., wrote us Dec. 20:—"We know nothing regarding the building of a new bridge at Niagara Falls, or the replacing of the present bridge. We have under construction, however, the replacing of approaches, with new bridges across streets, with cement walls and embankment between streets."

Minneapolis and St. Louis Rd.—Iowa Central Ry.—An issue of \$10,000,000 of

additional stock by these merged companies has been authorized by the State of Iowa. An official is quoted as stating that the line will be extended north from Minneapolis to Winnipeg, and south from Centerville, Iowa, to a connection with the Missouri, Kansas and Texas Ry. W. G. Bied, Vice President, is quoted as stating that the I. C. Ry. would be taken over by the M. and St. L. Rd. at the next meeting of the directors; that the financing for the amalgamated companies had been arranged, but the routes of the projected extensions had not yet been determined, that the company had made its investigations of the territory through which the lines would go, but their ideas had not yet been worked out. (Dec., 1911, pg. 1139.)

Minneapolis, St. Paul and Sault Ste. Marie Ry.—Track was laid during 1911 from Frederic to Boylston Jct., Wis., 73.1 miles, and nine miles south of Superior, Wis.

The plans for the proposed terminal in Chicago, Ill., to be built by the Central Terminal Co., and leased to the M., St. P. and S.S.M. Ry., are under consideration by the city authorities, as some questions concerning streets are involved.

The North Arm Bridge and Ry. Co. is asking the Dominion Parliament for authority to build a railway and general traffic bridge across the north arm of Burrard Inlet, from Turtle's Head to lot 575 north of White Rock Island, with a line of 10 miles to connect with the C.P.R. and existing and projected lines entering Vancouver, as well as a line on the north shore of the inlet to Vancouver, or to connect with any railway built or to be built on the north shore. The provisional directors are:—E. C. Cartwright, A. G. Langley, P. M. Smith, Vancouver; W. H. Langley, Victoria, B.C.

Residents of North Vancouver, B.C., passed a resolution, Nov. 25, asking the public authorities interested to oppose the application to the Dominion Parliament for power to build 10 miles of railway and a bridge across the north arm of Burrard Inlet, so as to connect the C.P.R. and other railways with North Vancouver. W. H. Langley, representing the promoters, said the project was in no way connected with the C.P.R., but several landowners along the route suggested for the line, stated that they had been informed the C.P.R. was at the back of the project. (Dec., 1911, pg. 1139.)

North Eastern Ry.—Application is being made to the Quebec Legislature to change the name to the North Ry. Co. and to give power to build the following lines in addition to those authorized by chap. 24 of the statutes of 1907; a branch to connect Ville Marie with the C.P.R. at Rapide de l'Orignal; one or more branches from near Lake Timiskaming to Lake Metagami, thence following the Nottaway River as far as Rupert's Bay or James Bay; a railway from Montreal to a junction with the National Transcontinental Ry., and thence to James Bay. L. A. Cannon, Quebec, is solicitor for applicants.

Montreal press reports state that M. J. O'Brien is interested in the building of this line, and that all the arrangements for starting construction early in the new year have been completed. (Sept., 1909, pg. 651.)

Northern Territorial Ry.—The Dominion Parliament is being asked to incorporate a company with this title to build a railway from Fort Churchill, on Hudson Bay, westerly to Lake Woolaston, Sask., to the south shore of Lake Athabasca, Alta., north of the Peace River Block, through the Rocky Mountains, to the Pacific coast at Port Eslington or the Portland Canal, with a branch from near the crossing of the Athabasca River via Fort McMurray

and Lac la Biche to Edmonton, Alta. Bishop, Pratt and Delavault, Edmonton, Alta., are solicitors for applicants.

Nova Scotia Steel and Coal Co.'s Ry.—We are officially advised that the company has sold its railway extending from Ferrona Jct. to Sunny Brae, U.S., to the Dominion Government for \$100,000, and that the line is now being operated as a branch of the Intercolonial Ry. (See Intercolonial Ry.)

Ottawa, Brockville and St. Lawrence Ry.—Application is being made for an extension of time for the building of the line authorized by chap. 71 of the Dominion statutes of 1900. N. Belanger, Ottawa, is Secretary of the company. (May, 1910, pg. 353.)

Pacific and Atlantic Ry.—The Dominion Parliament is being asked to extend the time within which the company may build the lines referred to in sec. 1, chap. 138, of the statutes of 1906. T. Gibson, Toronto, is solicitor for applicants. (April, 1910, pg. 271.)

Pacific and Peace River Ry.—The Minister of Railways has approved the route map of this projected railway from Bella Coola or Dean's Channel, B.C., to Dunvegan, Alta. (Mar., 1911, pg. 207.)

The route map approved by the Minister of Railways is for a line from about 60 miles east of Kamsquot Bay on the Pacific Coast, to Dunvegan, Alta.

Portland Canal, B.C.—Pacific coast press reports state that the Guggenheim interests have acquired a controlling interest in a large number of mines in the Portland Canal district of British Columbia, and that plans for their development, including the building of a railway, are under consideration.

Prince Edward Island Ry.—The Minister of Railways stated in the House of Commons, Dec. 4, that a contract had been let to T. Campbell, Charlottetown, P.E.I., for building a branch line from O'Leary's station to West Point, at an approximate cost on schedule price of \$72,706. The Government directed the stoppage of work in order that the Minister might enquire into the matter. (Oct., 1911, pg. 937.)

Quebec and Saguenay Ry.—It is reported that about 43% of the grading on the line under construction from St. Joachim to Murray Bay, Que., has been completed, and that it was expected that the line will be ready for operating by Sept. The directors are said to have under consideration plans for the extension of the line from Murray Bay to the Saguenay River. (Dec., 1911, pg. 1139.)

During 1911 track was laid on 7.5 miles, from mileage 56.5 to 64. We are advised that 34 miles of grading has been completed from St. Joachim to mileage 56.5, and that it is ready for track laying. Surveys are being made for an extension from mileage 64 to the outlet of Lake St. John at Grand Discharge, 80 miles. A. H. N. Bruce is Chief Engineer.

Quebec Central Ry.—The Quebec Public Utilities Commission has approved plans for the building of a 126 ft. deck lattice girder span, over the St. Francis River at Sherbrooke, Que. The contract for the superstructure has been let to the Dominion Bridge Co., Montreal. (Dec., 1911, pg. 1139.)

Quebec Eastern Ry.—Application is being made to the Quebec Legislature to authorize the company to absorb the Lotbiniere and Megantic Ry. Co., to increase the capital stock by adding the amount of the outstanding capital of the L. and M.R. Co., and to renew and validate all the powers conferred upon the Q.E.R. Co. and the L. and M.R. Co., to grant the company additional powers in regard to the issue of bonds or debentures; to declare that the company shall not be subject to article 6645 of the Re-

vised Statutes of Quebec, but that it shall have an extension of time for the building of its lines; and to provide that upon the amalgamation of the two companies the L. and M.R. Co. shall cease as a separate corporation. (Dec., 1911, pg. 1139.)

St. Charles and Huron Ry.—The Quebec Legislature is being asked to incorporate a company with this title, to build a railway from St. Ambroise de la Jeune-Lorette, on the Quebec and Lake St. John Ry., northerly for about eight miles to the Huron River in the parish of St. Edmond de Stoneham, Que. L. A. Cannon, Quebec, is solicitor for applicants.

St. John Valley Ry.—Some matters in connection with the final agreement with the Dominion Government for the building of this projected railway from St. John, along the river valley, were considered by the New Brunswick Government, Nov. 30. It was stated that the Dominion Government has decided to build certain bridges, which are estimated to cost \$1,250,000. The Premier of New Brunswick is quoted as saying that construction will be started in the spring. (Dec., 1911, pg. 1141.)

St. John Valley Ry.—Press dispatches from Fredericton, N.B., Dec. 12, state that the contract for the building of this projected railway was signed that day. The contract has been entered into between the Provincial Government and the St. John and Quebec Ry. Co., being signed on behalf of that company by A. R. Gould, of Presquid, Que., President, and J. V. Thomas, Secretary, with F. J. Lasman, New York, representing the financial interests associated with the company. The contract calls for the construction of a first class trunk line from Grand Falls to St. John, 208 miles, which is to be completed by Nov. 1, 1915, the section from Fredericton to Gagetown and from Fredericton to Centreville by Nov. 1, 1913. When completed the line is to be operated by the Intercolonial Ry., the S.J. and Q.R. Co. receiving 40% of the gross earnings. The province guarantees the bonds for the line up to \$25,000 a mile, while the Dominion Government also provides a subsidy upon the usual terms, and will build certain of the heaviest bridges.

In connection with this line, the end of the company located in the United States has a charter authorizing the purchase of a section of the C.P.R. in the vicinity of Aroostook Jct., and the building of a line to connect with the St. John Valley Ry. A. R. Gould is also President of this company, and R. Thompson, its Chief Engineer, has been in St. John, N.B., since Dec. 2, arranging for the starting of work in Canada. (Dec., 1911, pg. 141.)

Salisbury and Albert Ry.—The section of this line from Hillsboro to Albert, N.B., was re-opened for traffic, Dec. 4. (Dec., 1911, pg. 1141.)

South-East Kootenay Ry.—The British Columbia Legislature is being asked to extend the time within which the company may build the line authorized by chap. 63 of the statutes of 1906. Lenzie and Clarke, Victoria, B.C., are solicitors for applicants. (Aug., 1906, pg. 457.)

Sydney and Louisburg Ry.—Track was laid on 2.5 miles of new line during 1911 from Morine station to Birch Grove, N.S. An extension of a branch from Summit to Waterford Lake, one mile, is under construction, and extensions to colliery 17 and colliery 20, each one mile, are projected. (Oct., 1911, pg. 937.)

Temiskaming and Northern Ontario Ry.—During 1911 the new track laid included the following:—North Bay Jct. to Nipissing Jct., 3.53 miles; Porcupine branch, Iroquois Falls to Timmins town-site, 33.71 miles. There has been under survey a route for a projected line from

the main line to Elk Lake, about 30 miles. The Chairman of the Commission is reported to have stated in Toronto Dec. 7 that construction will be started on the new branch as early as possible in the spring. (Dec., 1911, pg. 1141.)

J. L. Englehart, Chairman of the Commission, returned to Toronto from a trip of inspection over the line Dec. 18. He is reported as having said that satisfactory progress was being made with the building of the extension of the Porcupine branch. Tracklaying was expected to start a few days after he left, and the extension should be completed early in Jan. The surveys in the Elk Lake country were being continued. We were advised, Dec. 20, that instrumental surveys for the extension of the line to Elk Lake were being completed, and that as soon as the reports are received by the Commissioners, location will not alone be made, but active efforts will be put in force for an early completion.

Vancouver and Peace River Ry.—Application is being made to the Dominion Parliament to incorporate a company with this title to build a railway from Vancouver, B.C., to the Fraser River in the vicinity of Lillooet, thence to Fort George, across the Parsnip River, through the Pine River Pass to Coalbrook in the Dominion Reserve Block, thence southeasterly to the Grand Prairie, Alta., on to Dunvegan, Peace River Crossing, and Fort Vermillion to Vermillion Chutes on the Peace River, with a branch from the middle branch of the South Pine River to Hudson's Hope on the Peace River. Abbott, Hart and Harg, Vancouver, are solicitors for applicants. (Sept., 1911, pg. 855.)

Application is being made to the British Columbia Legislature to incorporate a company to build a railway to be operated by any description of motive power, from Vancouver northeasterly to the Fraser River, near Lillooet, on to Fort George, northerly across the Parsnip River, through Pine Pass to Coalbrook in the Dominion Reserve Block, thence easterly to Swan Lake on the eastern boundary of the province, with a branch northerly from near Hudson's Hope to the eastern boundary of the province. Abbott and Hart McHarg, with Burns and Walkem, are jointly solicitors for the applicants.

Vancouver Underground Railway.—The British Columbia Legislature is being asked to incorporate a company to build a railway to be operated by any description of motive power, within a radius of seven miles from the corner of Hastings and Main streets, Vancouver, together with the necessary approaches, and to connect with the surface lines of railways and tramways, together with all powers and privileges usually given to railway companies. McEvoy, Whiteside and Buddle, Vancouver, are solicitors for applicants.

Victoria Harbor Railway.—The Victoria, B.C., city council had under consideration, Nov. 27, a report from the City Engineer on the plans for a railway along the city's harbor front. The plans show a main line from the outer wharf to a point on Selkirk water about midway between Garbally Road and Bridge St., with spur lines connecting with all railway lines entering the city. There are, says the City Engineer, no engineering difficulties in the way of construction so far as the city is concerned. It would be necessary for the city to pass a bylaw as to street crossings and street ends. At a previous meeting some objections were made by the council, and new detailed plans were made to meet them. The council will finally consider the plans after a vote of the ratepayers has been taken.

Application is being made to the British Columbia Legislature to extend the

time within which the projected railway may be built.

Victoria reports state that the company is entirely local, having a capital of \$1,000,000, of which \$250,000 has been subscribed by leading business men in the city.

Winnipeg City Power Line.—The city board of control has under consideration tenders for the supply of 100 tons of relaying rails, 56 and 60 lbs., for delivery at Lac du Bonnet, Man. (Dec., 1911, pg. 1141.)

The Postmaster General on the Quebec Bridge.

Speaking at Quebec, Dec. 10, Postmaster General Pelletier said:—The contract for the substructure was given long ago to M. P. and J. T. Davis for \$3,350,000, and the work is well under way. The contract for the superstructure was signed on Apr. 4 last for \$8,650,000. The apparent contractor is the St. Lawrence Bridge Co., but there is another company associated with it. The date for the completion of the work is five years. I have had long interviews with the company's engineer, and he says that we may expect for certain reasons that the time will have to be extended at least one year more, which shows that whereas the Transcontinental Ry. will be practically finished within two years, the bridge cannot be ready before six years. The contractors are building an immense plant at Montreal for the erection of their bridge.

The contract as awarded has shut out tramway and vehicle transportation, and the late Government decided that in consequence of that change, which I understand was an indispensable condition, the province and city of Quebec should be refunded the amount which they had subscribed. I suppose it is too late now to change that, and we had better let the city and province get back their money. However, I understand that with a slight change tramway communications can yet be secured. On the whole, the bridge question will stand as a most improvident piece of statesmanship. The legacy of the late Government in this respect is as follows: \$3,350,000 for the substructure, \$8,650,000 for the superstructure, for a rather narrow bridge, and \$6,000,000 already sunk and wasted, which makes a total of \$18,000,000 for a bridge to be ready four or five years after the Transcontinental Ry. has been completed, and Quebec sidetracked in the interval, except inasmuch as we can provide for car transportation as they do at Detroit.

Duluth, South Shore and Atlantic Ry.—During 1911 the company built and laid track on 12.60 miles of spur lines, as follows: Soo Jct. to Hunter's Mill, Mich., 4.72 miles; Trout Creek to Woods, Mich., 5.50 miles; Basco to Woods, Mich., 1.33 miles; Ewen to Jensen's Mill, Mich., 0.92 mile; Deraison to Woods, Mich., 0.13 mile. (Dec., 1911, pg. 1131.)

The Grain Growers Export Co., Ltd., has been incorporated under the Dominion Companies Act, with \$250,000 capital and office at Winnipeg, to deal in grain, and in connection therewith to own and operate vessels and other means of transportation, grain elevators, etc. The incorporators are W. G. Hall, J. Wright, W. H. Trueman, W. Hollands, T. W. Robinson, and E. Smith, Winnipeg.

The Macdonald Contracting Co. has been incorporated under the Ontario Companies Act with a capital of \$40,000 and office in Toronto, to carry on a general contracting business. The provisional directors include:—W. R. Macdonald and F. M. Macdonald, sons of the late Randolph Macdonald.

Traffic Orders by the Board of Railway Commissioners.

The dates given for orders are those on which the hearings took place and not those on which the orders were issued.

BINDER TWINE RATES FROM WELLAND.

15286. March 15, 1910.—Re application of the Plymouth Cordage Co., of Welland, for an adjustment and reduction of freight rates on cordage and raw material to and from Welland, and for a re-hearing of the case, heard at Toronto, April 28, 1909, which was disposed of by order 7897, August 10, 1909.

It is ordered that the rates of the Grand Trunk Ry. and the Michigan Central Rd. to be charged on binder twine for harvesters, in bales or boxes, in carloads of the minimum weight of 30,000 lbs. per car of not over 36½ ft. inside length (subject to rule 1 (b) of Canadian Classification), from Welland, to points in Canada on their respective lines, and on the lines of other companies, the same being in either case within the territories covered by the current commodity tariffs on binder twine from Welland of the said companies respectively, shall not exceed the following to the same points, namely:—the commodity rates on binder twine from Welland in effect at the date of this order; the 5th class rates from Welland; the rates on binder twine current from Auburn, via the Niagara frontier, less 2 cents per 100 lbs. The said companies shall comply with this order by publishing and filing special and joint tariffs to take effect not later than Dec. 15, 1911. The Wabash Rd. shall comply with this order in so far as it relates to shipments to points on the lines of its connections in Canada.

OIL RATES, ILLINOIS TO TORONTO.

15297. Nov. 9.—Re application of the Canadian Pacific Ry., under section 56 of the Railway Act, for leave to appeal to the Supreme Court of Canada, from order 14386, May 16, 1911, made upon the application of the British American Oil Co., and declaring the legal rate chargeable on carload shipments of crude oil from Stoy, Ill., to Toronto, Ont., was the fifth class joint through rate in effect at the time the shipments moved, and in accordance with Official Classification 29 and subsequent issues thereof. It is ordered that the C.P.R. be granted leave to appeal to the Supreme Court on the following question of law:—"What was the legal effect, if any, of the supplements filed by the Indianapolis Southern Rd., effective respectively Oct. 18, 1907, and May 14, 1908, on the joint through rate established by that company on oil from Stoy, Ill., to Toronto, Ont., on Jan. 20, 1907?"

COAL RATES TO STRATHCONA.

15332. Sept. 12, 1911.—Re application of Interprovincial Coal Company of Strathcona, Alta., for order directing that freight rate on coal from Clover Bar to Strathcona, Alta., over the Grand Trunk Pacific, the Canadian Northern, and the Canadian Pacific Railways, be changed from \$27 per car to 40 cents per ton, or such rate as the Board may think reasonable. Upon hearing the application and reading the answers filed on behalf of the railway companies; and upon the report of the Chief Traffic Officer of the Board that the Canadian Northern Ry. has reduced its rate to 40 cents per ton, which includes the C.P.R.'s terminal switch at Strathcona, making the through rate 70 cents per ton or \$21 per car of 30 tons. It is ordered that the application be dismissed.

CONSTRUCTION OF SIDING—FERTILIZER RATES.

15394. Nov. 14, 1911.—Re application of W. H. Haight, of Pipers Siding, B.C., under sec. 226 of the Railway Act, for

an order directing the Great Northern Ry. to construct, maintain and operate a spur, or siding, to applicant's property near Pipers Siding and to provide lower rates on shipments of fertilizer from Vancouver and New Westminster to the said siding. It is ordered that the railway company shall construct, maintain and operate a spur, or branch line, to the applicant's property, the applicant to deposit in a chartered bank such sum of money as the parties may agree shall be necessary to defray the expenses of constructing and completing the spur. In the event of their failure to agree, the Board will fix the amount to be paid into the bank. The railway company shall repay or refund to the applicant one-half of the tolls charged by the company in respect of the carriage of traffic for the applicant over the said spur, or branch line, until the aggregate amount paid by the applicant in the construction and completion of the spur shall have been repaid to him; the applicant, or the railway company, shall file a plan, with profile and book of reference, showing the proposed location of the spur; and publication of notice of the application may be dispensed with.

The railway company shall publish and file, not later than Dec. 1, 1911, at Ottawa, a commodity rate of 3 cents per 100 lbs. on ashes for fertilizing purposes, minimum weight, 40,000 lbs. per carload; 2½ cents per 100 lbs. on horse manure, minimum weight, 30,000 lbs. per carload; and 2½ cents per 100 lbs. on other stable manure, minimum weight, 40,000 lbs. per carload—from Vancouver and New Westminster to the said siding.

Order 15579 Dec. 6, 1911, extended the time for publishing and printing the rates directed in order 15394 to Jan. 1, 1912.

COAL SWITCHING CHARGES AT PRESCOTT.

15472 Nov. 23.—Re application of certain coal dealers of Prescott, Ont., complaining that the charge by the C.P.R. of 20 cents a ton for shunting coal in its yards when received from the New York Central & Hudson River Rd., is excessive; and applying for an order directing the railway company to reduce its charge for such service. It is ordered that the C.P.R. Company within 30 days reinstate the rate shown in its tariff, C.R.C. no. E 1234, effective Sept. 1, 1908, of 15 cents a net ton, minimum \$3 a car.

COAL RATES FROM ROUSE'S POINT.

15540. Nov. 25.—Re application of Canadian Retail Coal Association, complaining that rate charged by the G.T.R. on shipments of coal from Rouses Point and Massena Springs to Alexandria is excessive and discriminatory as compared with the rate charged from these points to Ottawa. It is ordered that the G.T.R.'s special tariff on coal and coke from Rouses Point, N.Y., be amended so as not to exceed the following rates per ton of 2,240 lbs. to the designated stations, the rates to be made effective not later than Jan. 15, 1912, viz.:—

To Ste. Justine, Que., anthracite, 85c.; bituminous, 75c.

To Glen Robertson, Ont., anthracite, 90c.; bituminous, 80c.

To Dalkeith, Ont., anthracite, 90c.; bituminous, 80c.

To Vankleek Hill, Ont., anthracite, 95c.; bituminous, 85c.

To Alexandria, Ont., anthracite, 90c.; bituminous, 80c.

To Greenfield, Ont., anthracite, 95c.; bituminous, 85c.

To Maxville, Ont., anthracite, 95c.; bituminous 85c.

The Alberta Legislature has under consideration a measure providing for the creation of a Department of Railways and Telephones.

THE Railway and Marine World

Established 1898.

DEVOTED TO STEAM AND ELECTRIC RAILWAY,
MARINE, EXPRESS, TELEGRAPH, AND RAILWAY
AND CANAL CONTRACTORS' INTERESTS.

OFFICIAL ORGAN OF THE VARIOUS CANADIAN
TRANSPORTATION ASSOCIATIONS.

Changes in Location of Matter.

Beginning with this issue the alpha-
betical list of advertisers, which has
heretofore been published on this page
in the centre of the paper, appears on
the last page of the paper, which is
more convenient for quick reference.

The Purchasing Agents' Guide to the
manufacturers of and dealers in steam
and electric railway, marine, express,
telegraph and contractors' supplies ap-
pears on pages immediately preceding
the alphabetical list of advertisers.

Telephone Train Dispatching on the C.P.R.

As illustrative of the absurd charac-
ter of much of the information about
railway matters published in the daily
press may be quoted a dispatch from
St. John, N.B., of Dec. 7, to which wide
publicity was given, stating that the
telephone train dispatching which had
been in use on the C.P.R., had been
abandoned, and that the telegraph sys-
tem of dispatching has been returned
to, the telegraph system having been
found unsatisfactory. There was abso-
lutely no foundation whatever for the
dispatch referred to. The system of
telephone train dispatching on the
C.P.R. has proved entirely satisfactory
to the Operating Department, and will
doubtless be considerably extended to
other parts of the system during the
current year.

An officer of the company writes us as
follows: "The telephone dispatching on
the Atlantic Division has been a com-
plete success in every respect. It was
so good that we were enabled to dis-
pense with one dispatching office for the
summer months and handle all the main
line dispatching on this division from
one office. The business, however, is too
heavy to continue this during the win-
ter months and we are reopening the
dispatching office at St. John. The tele-
phone line was adjusted to work from
Brownville Jct. to St. John, and while
it was being readjusted, so that we could
work it from St. John to McAdam Jct.,
it was necessary to use the telegraph be-
tween these two points for a couple of
days until the change in the telephone
system was made."

Dates of Railway Commissioners' Orders.

The dates given on the orders issued
by the Board of Railway Commissioners
are not those of the days on which the
orders are actually issued, but are the
dates on which the cases were heard.
For example, order 15286, respecting
binder twine rates from Welland, Ont.,
is dated Mar. 15, 1910, that being the
date on which the case was heard at Ot-
tawa, but the order was not issued until
Nov. 8, 1911.

It would undoubtedly be much better
for the orders to be dated the actual
days of issue. A reference to the date
of the hearing might be appended, if
thought desirable, but the most im-
portant date is that of the issue of the
order, as that is when it generally goes
into effect.

It is misleading to have an order
which did not go into effect until Nov.
8, 1911, dated Mar. 15, 1910.

When the Board started issuing orders
they were not numbered at all. We
suggested that the orders be given con-
secutive numbers, and the suggestion
was acted on. We hope our present
suggestion will also meet with approval.

The city of Edmonton is applying to
the Alberta Legislature for confirmation
of a bylaw granting exemption from
taxation, with certain other privileges to
the Grand Trunk Pacific Development
Co. A similar act is being applied for
by the G.T.P.D. Co.

gust.

Mainly About Transportation People.

Sir Wm. Whyte has been elected President of the St. Andrew's Society of Winnipeg.

Sir Wm. Whyte has been re-elected a director of the St. Charles Country Club, Winnipeg.

Hugh Sutherland, Executive Agent, Canadian Northern Ry., Winnipeg, and Mrs. Sutherland, expect to sail Jan. 20 for Egypt.

U. Barthe, formerly Secretary of the Quebec Bridge Co., has been appointed collector of succession taxes for the district of Quebec.

W. Cuthbert, Montreal, is reported to be retiring from the G.T.R. after having been 37 years in the service, latterly as Fuel and Tie Agent.

D. C. Dawson, District Traffic Superintendent, Western Union Telegraph Co., St. John, N.B., is taking an extended holiday for rest and change.

C. C. LeBree, of the Canadian North-Eastern Ry. freight and passenger department, Stewart, B.C., arrived in Toronto, Dec. 15, for a holiday.

Jos. Bishop, who died at Crysler, Ont., recently, was father of W. J. Bishop, of the National Transcontinental Railway survey staff at Cochrane, Ont.

Col. Alex. Bertram, of the John Bertram and Sons Co., Ltd., has been elected on the executive committee of the St. John's Ambulance Association.

R. Cummings, stationmaster at Truro, N.S., completed his fortieth year of service with the Intercolonial Ry. and its predecessor, the Nova Scotia Ry., Dec. 1.

J. McKibbin, a C.P.R. brakeman, was, Dec. 6, presented with the Royal Humane Society's bronze medal, for saving life at Parkdale, Ont., June 7, 1911.

Mrs. J. Mallon, who died in Toronto recently, was the mother of Mrs. J. J. Scully, wife of the C.P.R. General Superintendent at Moose Jaw, Sask.

H. H. Vaughan, assistant to the Vice President, C.P.R., accompanied by Mrs. Vaughan, returned to Montreal from England, by way of New York, early in December.

F. W. Morse, formerly of the G.T.R. and G.T. Pacific Ry., and now Vice President and General Manager, Chicago and Alton Rd., was in Montreal recently.

G. T. Pettigrew was presented with a diamond scarf pin by the business men of Stratford, Ont., on his recent removal to Montreal, as G.T.R. Division Freight Agent.

J. L. Englehart, Chairman, Temiskaming and Northern Ontario Ry. Commission, addressed the Canadian Club at Hamilton, Ont., Dec. 7, on the Land of Timiskaming.

J. S. Leighton, jr., who recently resigned the position of Claims Agent for the Intercolonial Ry., has been appointed Managing Editor of the Sentinel, Woodstock, N.B.

C. N. Armstrong, who was the principal promoter of the old Atlantic and Lake Superior Ry. project, and Mrs. Armstrong, returned to Montreal, from England, recently.

J. D. Cogger was presented with a gold watch by the G.T.R. and Intercolonial Ry. freight offices staffs at Montreal, in which he was chief clerk, on his leaving the service, Dec. 7.

R. W. Leonard, Chairman, National Transcontinental Ry. Commission, has offered to erect a tower with a chime of bells for Grace Church, Brantford, Ont., in memory of his parents.

Dr. Milton Hersey, Consulting Chemist, C.P.R., Montreal, is reported to have given \$1,000 for the improvement of the Kingston, Ont., School of Mines chemical department industrial laboratory.

Julius Kruttschnitt, Vice President and director of Maintenance and Operation of the Harriman lines, has moved his residence from Chicago to New York City, which is now his headquarters.

E. D. Nash, for a number of years Assistant Superintendent of the Southern Division of the Central Vermont Ry., at New London, Conn., died in Panama recently, following an operation for stomach trouble.

P. C. Caron, station master, Bonaventure station, Montreal, died there suddenly, Dec. 3. He had been in the G.T.R. service for 36 years, and for the past 12 years had been station agent at Bonaventure.

C. R. Moore, who was recently appointed chief clerk to Vice President Kelley, G.T.R., Montreal, has been presented with a gold watch by his former associates in the G.T.R. Superintendent's office, Toronto.

S. James, who died at Hamilton, Ont., recently, was for a number of years private secretary to James Stinson, of Chicago, Ill., who was associated with the promotion of railway enterprises in Hamilton many years ago.

W. S. Kemp, who has just retired from active service on the Elgin Joliet and Eastern Ry., was over 20 years ago Assistant Superintendent and Divisional Superintendent Great Northern Ry., St. Paul and Manitoba Division.

E. Rawlings, President, Guarantee Co. of North America, who died in Montreal, Dec. 12, was a director of the Montreal Telegraph Co. One of his daughters is married to A. P. S. Glassco, of the G.T.R. engineering staff, Hamilton, Ont.

F. Cooper was presented with a gold chain and locket by the heads of the C.P.R. departments in London, Ont., on his transfer from the position of Resident Engineer there to that of Resident Engineer, District 2, at Montreal.

W. B. McKenzie, Chief Engineer, Canadian Government Railways, addressed a meeting of the Central Farmers' Institute at Charlottetown, P.E.I., on "Good Roads," recently, as representing A. W. Campbell, Deputy Minister of Railways.

H. Lennox, K.C., M.P. for South Simcoe, Ont., has been elected chairman of the House of Commons Committee on Railways and Canals for the current year. R. Blain, M.P. for Peel, Ont., is chairman of the Committee on Forests and Waterways.

F. E. Gibbs, who has been appointed Chief Grain Inspector, Western Division, at Winnipeg, was entertained by the Fort William, Ont., board of trade recently, on his leaving the position of Grain Inspector there, which he had held for a number of years.

A. M. Grantham, formerly Purchasing Agent and Superintendent of Construction, Toronto Ry., and J. Brooks, have bought the hardware business of the Canada Glass Mantles and Tiles, Ltd., Toronto, and will carry on the same as the Canada Hardware, Ltd.

Sir Wm. Van Horne, R. B. Van Horne, G. M. Bosworth, W. Shaughnessy, and W. R. McInnes, are among the incorporators of the Canadian Sardine Co., which has been formed under the Dominion Companies Act to operate a sardine packing plant at Chamcook, near St. Andrews, N.B.

D. O. L'Esperance, who was elected recently M.P. for Montmagny, Que., was entertained at dinner in Quebec city recently by the International Order of Railway Telegraphers, of which he is a member. He was in the Intercolonial Ry. service from Oct., 1835, to April, 1902.

O. M. Lang, General Superintendent, Central New England Ry., a subsidiary of the New York, New Haven and

Hartford Rd., who died at Hartford, Conn., Dec. 15, of typhoid, was born at London, Ont., July 28, 1872. He entered railway service in the United States in 1890, with the Chicago, Burlington and Quincy Rd.

Sir William Mackenzie, President, Canadian Northern Ry., and D. B. Hanna, Third Vice President, sailed from Halifax, N.S., for Bristol, by the s.s. Royal George, Dec. 13. Sir William will spend Christmas with Lady Mackenzie and some of their family in Paris. Mr. Hanna expects to sail from England on his return Jan. 10.

J. B. Elliott was presented with a couch and a chair by the C.P.R. locomotive engineers running in and out of Ottawa, on the occasion of his recent retirement from active service as Master Mechanic at Montreal. He began work as a boy with the old Brockville and Ottawa Ry., and remained with that company and its successors for 46 years.

Sir Donald D. Mann, who underwent an operation on Oct. 30, had sufficiently recovered to spend a short time at his office Dec. 12. On Dec. 14 he left Toronto for San Francisco in his private car Athabasca, accompanied by Lady Mann, their son, Miss Nesbitt, of Woodstock, and his secretary. He will probably spend most of January in California.

F. E. Snow, who died in Detroit, Mich., Dec. 1, where he was interested in electric railway building, was in early life employed by the Great Western Ry. and the Wabash Rd., and was General Passenger Agent of the Canada Southern Ry. when it was taken over by the Michigan Central Rd. One of his sons, M. B. Snow, is Assistant General Superintendent Michigan Central Rd.

A. W. Carpenter, carrying on business as the Charing Cross Bank, London, Eng., which closed its doors Oct. 17, 1910, has been sentenced to two years imprisonment for fraud and false pretences in connection with the bank's business. The bank was financing the Atlantic, Quebec and Western Ry., the Gaspe harbor development, and some industrial concerns in the Gaspe peninsula, Que.

James Edward, who has been appointed Commercial Agent, G.T.R., Moncton, N.B., entered G.T.R. service Sept. 1, 1883, since when he has been. 1885, telegraph operator at Omamee Jct., Ont., and other points; 1885 to 1892, station agent at Lakefield, Ont., and other points; 1892 to 1903, Agent, Great Eastern Fast Freight Line and Contracting Freight Agent, G.T.R., Montreal; 1903 to 1904, Traveling Freight Agent, Montreal, and 1904 to Nov. 29, 1911, Traveling Freight Agent, Moncton, N.B.

Benjamin Douglas, M. Am. Soc. C.E., for many years Bridge Engineer of the Michigan Central Rd., and more recently Tunnel Engineer for the Detroit River Tunnel Co., was killed recently by a fall from a bridge near Capoeira, Brazil. He was born in Detroit, Mich., in 1859, and graduated from the University of Michigan in 1882. In 1885 he became Bridge Engineer of the Michigan Central Rd., which position he held until 1905, when he was appointed Tunnel Engineer on the construction of the Detroit River tunnel. Since 1910 he carried on a private consulting practice, with office in Detroit.

A. M. Sutherland, who recently resigned the position of Assistant Superintendent, Western Division, Duluth, South Shore and Atlantic Ry., Thorndon, Mich., to go into farming, was born at Hartford, Conn., Apr. 2, 1844, and entered railway service in 1861, since when he has been, to 1865, track laborer, G.T.R.; 1865 to 1867, mining; 1867 to 1870, section foreman, Chicago and North Western Ry.; 1870 to 1872,

locomotive fireman, and 1872 to 1881, locomotive driver, same road; 1881 to 1889 Roadmaster, same road; 1889 to Dec., 1911, Assistant Superintendent, D.S.S. and A.R., Thormaston, Mich.

W. W. Walker, who has been appointed Vice President and General Manager, Duluth, South Shore and Atlantic Ry. and Mineral Range Rd., Duluth, Minn., was born at St. Catharines, Ont., June 3, 1868. He began railway work in 1883 with the G.T.R., and in 1884 entered the service of the Queen and Crescent Route, where he was to 1887 in the traffic department. From 1887 to 1888 he was in the Chicago and North Western Ry. claim department, and from Oct., 1888, to Feb., 1890, was rate clerk and chief clerk, Great Northern Ry. He was appointed Travelling Freight Agent, D.S.S. and A.R., Nov., 1890, Assistant General Freight Agent, 1897, and from July, 1901, to Dec. 1, 1911, was General Freight Agent at Duluth, Minn.

Duncan MacPherson, M. Can. Soc. C.E., and a member of its council, who has been appointed Assistant to the Chairman, National Transcontinental Railway Commission, was born at Bath, Ont., Feb. 2, 1858, and entered railway service, Nov., 1880, since when he has been, to Feb., 1881, rodman on Canada Central Ry. surveys on the extension west of Pembroke, Ont.; Feb., 1881, on the incorporation of the C.P.R., when the Canada Central Ry. was taken over, to Aug., 1882, rodman on revision of location and construction, leveller, transitman and engineer in charge of a section of final location and construction of the C.P.R.; Aug., 1882 to 1886, Assistant Engineer of about 400 miles of line, then constituting the C.P.R. Eastern Division; 1886 to July, 1905, Division Engineer in charge of maintenance of way, track, bridges, buildings, etc., Eastern Division, and construction of branch lines; Aug., 1905, to Dec., 1911, Assistant Chief Engineer, National Transcontinental Ry. He graduated from the Royal Military College, Kingston, Ont., in 1880, being first in engineering.

C. W. Houston, who has been appointed Superintendent, Duluth, Rainy Lake and Winnipeg Ry., Virginia, Minn., was born at Hardwick, Vt., Jan. 15, 1858, and entered railway service June, 1875, since when he has been, to Oct., 1883, consecutively, telegraph operator, agent, brakeman, fireman and conductor on the Portland and Ogdensburg Ry., Chicago, Milwaukee and St. Paul Ry., Minneapolis and St. Louis Rd., and Burlington, Cedar Rapids and Northern Ry.; Oct., 1883, to Sept., 1891, dispatcher, B.C.R. and N. Ry.; Sept., 1891, to July, 1904, consecutively, dispatcher, Chief Dispatcher and Trainmaster, Northern Pacific Ry.; Sept. to Dec. 31, 1904, dispatcher, Great Northern Ry.; Apr., 1905, to Mar., 1907, dispatcher and Trainmaster, El Paso and Southwestern Rd.; Mar., 1907, to Dec., 1909, consecutively, dispatcher, conductor and Trainmaster, Mexican Central Ry.; Jan. to Nov., 1910, dispatcher and Chief Dispatcher, Frisco Lines; Nov., 1910, to Feb., 1911, rule instructor, Canadian Northern Ry.; Feb. to Dec., 1911, Chief Dispatcher, Duluth, Rainy Lake and Winnipeg Ry.

M. B. Murphy, Superintendent, District 2, Canadian Northern Ry., Winnipeg, whose portrait appears on this page, was born at Napa, Cal., Sept. 11, 1866, and entered railway service, Jan. 24, 1880, since when he has been, to Jan., 1895, successively, operator, agent, brakeman, conductor, yardmaster, dispatcher, chief dispatcher, and connected with the construction department in charge of construction of the Nantassett Branch, Union Pacific Rd.; Jan., 1895, to Mar., 1898, county clerk, Carbon county, Wyo., and subsequently en-

rolling and engrossing clerk in charge of the compilation of the session laws of the fourth Legislature of Wyoming; Mar. to July, 1898, dispatcher, Union Pacific Rd.; July to Nov., 1898, in charge of locomotive performance statistics, Chicago, St. Paul, Minneapolis and Omaha Ry., Itasca, Wis.; Nov., 1898, to Jan. 16, 1899, operator and dispatcher, Eastern Minnesota Ry. West Superior, Wis.; Jan. 16, 1899, to July 31, 1900, dispatcher and Chief Dispatcher, Northern Pacific Ry., Staples, Minn., and Glendive, Mont.; July 31 to Nov., 1900, Chief Dispatcher, Union Pacific Rd., Green River, Wyo.; Nov., 1900, to Jan., 1903, Chief Dispatcher, Denver and Rio Grande Rd., Minturn, Colo.; Jan., 1903, to Sept. 20, 1906, Chief Dispatcher and Trainmaster, El Paso and Northeastern Rd., Alamogordo, New Mexico; Sept. 20, 1906, to Jan. 1, 1910, Trainmaster, Mexican Central Ry., Chihuahua, Mexico; Jan. 1 to Apr., 1910, General Yardmaster, Omaha, South Omaha and Council Bluffs terminals, Chicago and Great Western Ry.; May 1, 1910, to Feb. 27, 1911, Trainmaster, District 2, Canadian Northern Ry., Winnipeg, and during

P246 M. B. Murphy,
Superintendent, District 2, Canadian
Northern Ry., Winnipeg.

Aug. and Sept., 1910, acting Superintendent, C.N.R., at Winnipeg; Feb. 27 to Nov., 1911, Superintendent, Duluth, Rainy Lake and Winnipeg Ry., Virginia, Minn.

The Central Railway and Engineering Club of Canada held its annual meeting in Toronto Dec. 19. J. Bannon, chief engineer of the heating plant, etc., in the Toronto City Hall, was elected President; A. Taylor, foreman, boiler shop, Polson Iron Works, First Vice President, and E. Logan, foreman, G.T.R. shops, Toronto, Second Vice President. Of the seven members of the executive committee elected, only one is in railway service, namely, W. C. Sealy, General Foreman, G.T.R., Toronto. The club donated \$120 to various charities.

T. H. Watson, Manager, Canada Bolt and Nut Co.'s Branch Steel Co. of Canada, Ltd., has resigned, and has been elected Vice President and Managing Director of the Spanish River Pulp and Paper Mills, Ltd. He will continue to have his headquarters in Toronto.

Northern Railway Lines in Canada

Fort William, Ont.—At a civic dinner, Dec. 1, A. Vickers stated that plans were being prepared by another railway company for bringing its lines into Fort William, from the United States. Survey parties had been in the field between Fort William and the International boundary, and it was likely that something would be heard of the project officially early in the year. It is said that the G.N.R. is the company referred to.

Midland Ry. of Manitoba—Midland Great Northern Ry.—The company expected to have eight miles of tracks on its line into Winnipeg laid by Dec. 31.

As a matter of fact a direct train service into the company's own freight terminals in Winnipeg was put in operation Dec. 4, though the line was not then fully completed, as the track had not been laid down quite to the sheds. The line is expected to be fully completed by the end of Jan., with the exception of the steel bridge over the Assiniboine River. This bridge will have a 240 ft. draw span, and two other spans, one of 105 ft. and one of 60 ft., the steel for which has been delivered. The temporary bridge erected for construction purposes will be used until the steel bridge is completed.

Moose Jaw, Sask.—A press report states that engineers and other officials of the company have been in Moose Jaw for some little time looking into the question of a line into that place.

Nelson and Fort Sheppard Ry.—Press reports state that the Northern Pacific Ry. has begun a freight service into Nelson, B.C. C. W. Breckenridge, one of the company's traveling freight and passenger agents, was at Nelson, Dec. 7, and stated that the N.P.R. had running rights over the G.N.R. lines from Spokane to Nelson and Rossland.

Vancouver, Victoria and Eastern Ry. and Navigation Co.—The construction work for 1911 included the laying of 12 miles of track from Princeton to Coalmount, B.C., and we were recently officially advised that it was expected to have six miles of track laid on the coast section of the line from Abbotsford westerly to Kilgord, B.C., by Dec. 31.

The final revision survey for the line across Hope Mountains was completed Dec. 6 by W. W. Auburn and M. A. Butler. In an interview, Dec. 14, J. H. Kennedy, Chief Engineer, is reported as having said that the uncompleted gap between Tulameen and the Hope Mountains, 76 miles, could be finished within two years. The reports and surveys now completed would be forwarded to St. Paul for approval. The line will follow the Coquihalla River, with a maximum gradient of 2.2%. There will be 14 short tunnels and one of over 1,000 ft. in length. (Dec., 1911, pg. 1129.)

Dominion Railway Subsidies.—A contract, under the act granting aid towards the building of certain railways, was entered into Nov. 11, 1911, between the Dominion Government and the Orford Mountain Ry. for the building of an extension from Mansonville, Que., to the International boundary, 3.12 miles. This line was built some time since.

The New York Central and Hudson River Rd. Co. has issued a circular to the holders of its \$110,000,000 3½% collateral trust bonds, which were given in exchange for stock of the Lake Shore and Michigan Southern and Michigan Central roads, asking their consent to merge either or both roads with the parent company.

The Minister of the Interior is credited with stating in Winnipeg, Dec. 23, that J. D. McArthur will be authorized to go on at once with his contract for the first section of the railway from the Pas Mission, Sask., towards Hudson Bay.

Canadian Pacific Railway Construction, Betterments, Etc.

Halifax, N.S., to Moncton, N.B.—Local press reports in Halifax, N.S., state that engineers have gone over the route of a line to connect Halifax with Moncton, N.B., by means of extensions of the Dominion Atlantic Ry. The route gone over is stated to have included the Stewiacke Valley, between Amherst and Truro, and it is said that it is possible to secure a gradient equal to that of the National Transcontinental Ry. for the entire distance.

Aroostook Jct., N.B.—The Board of Railway Commissioners has authorized the C.P.R. to expropriate certain lands near the line at Aroostook Jct., N.B., for the erection of new buildings.

Weston-Lambton Branch.—We are officially advised that it is likely a line will be built in the near future for connecting the Toronto-Windsor line and the Toronto-Sudbury line. A route has been surveyed for this line, starting from near Islington, on the Toronto-Windsor line, northerly to near Weston, about 4.5 mile. Application is being made to the Board of Railway Commissioners for approval of the route.

Orford Mountain Ry.—The extension from Mansonville, Que., to the International boundary, 3.12 miles, for which a contract, under the act granting aid to certain railways, was entered into with the Dominion Government, Nov. 11, has already been built, and it is being operated as part of the C.P.R. system.

Campbellford, Lake Ontario and Western Ry.—Plans are being prepared for filing with the Board of Railway Commissioners for this projected railway. The plans will show a route starting from the Montreal-Toronto line at Glen Tay, to which point the second track work from Montreal is being completed, and proceeding southwesterly to Belleville, and along the lake shore, rejoining the Montreal-Toronto line near Leaside Jct. It was reported that the plans had been filed Dec. 4, but J. W. Leonard, assistant to the Vice President, Eastern Lines, was reported as stating, Dec. 8, that some points on the route had not been finally decided upon, and that the plans would not be filed for about a month. A map showing the route of the line through Belleville has, however, been filed in the Registry office there.

Georgian Bay and Seaboard Ry.—A freight service was placed in operation on this newly completed line early in Dec., and it is expected that a passenger service will be arranged for early in the new year. The line from Victoria Harbor to Coldwater Jct., on the Toronto-Brantford line, has been operated for nearly two years. From Coldwater Jct. the line passes easterly and southerly via Orillia and Lindsay, to Bethany Jct., on the Montreal-Toronto line. It has a total length of 81 miles. The wharves, grain elevators and terminal facilities are on the shores of Victoria Harbor, where a new town is springing up, to which the name of Port McNicoll has been given.

Toronto Office Building.—The office building being erected on the corner of Yonge and King Streets, an illustration of which is given on this page, will be 16 stories. It will have a frontage of 120 ft. on Yonge St., and of 75 ft. on King St. West. It will be of steel construction, with granite columns 30 ft. high on both frontages, above which the building will be of semi-glazed terracotta. The two lower floors will be wide open to the daylight, the walls being formed of large sheets of glass framed in steel. The entire construction will be fireproof, the floors being of concrete. The double doorway on the ground floor

gives a diagonal passage between the two streets. The ground floor will be used by the company, including ticket offices for the railway the lake and ocean steamships, and the telegraph offices, and the second floor will be used by the District Passenger Agent and his staff. The other floors will be let as offices, the top storey, which will be 18 ft. high, will be devoted to the C.P.R. telegraph operating department.

South Ontario Pacific Ry.—The Board of Railway Commissioners has recommended the Governor-in-council to approve the lease of the S.O.P. Ry. to the C.P.R. This line is under construction from Guelph Jct. to Hamilton, Ont.

Owen Sound Elevators.—The C.P.R. elevators A and B, at Owen Sound, Ont., were destroyed by fire, with their contents, Dec. 11. The loss is given approximately as \$1,000,000, of which

Canadian Pacific Railway Office Building, King and Yonge Streets, Toronto.

about half is for grain. Elevator A was built in 1884, and B in 1897. In connection with the latter elevator, a bonus of \$40,000 and other concessions were granted by the town, and it is stated that under the agreement the C.P.R. will either have to rebuild elevator B, or refund the greater portion of the bonus. The whole property was covered by insurance, and J. Richardson and Sons, Kingston, who owned most of the grain, have purchased the grain salvage.

Collingwood Southern Ry.—Representatives of the Collingwood Board of Trade waited on D. McNicoll, Vice President, C.P.R., at Montreal, recently to discuss the question of the building of a line into Collingwood, Ont. They subsequently reported that the C.P.R. management had the proposition under consideration. Such a line would cost \$800,000, on which cost the company asked

a net revenue of 5%. M. H. Brown, Division Freight Agent, C.P.R., was in Collingwood Dec. 9, collecting information as to the possible traffic.

It is suggested that the line connect with the Toronto-Sudbury line near Baxter. The C.S. Ry. Co. was incorporated in the C.P.R. interests some years ago to build such a connection.

Fort William Coal Handling Plant.—An additional coal handling plant is to be built at Fort William, Ont. Press reports state that the estimated cost is \$500,000. The plant will, it is said, involve the building of a bridge, two car dumping unloaders, coal conveyor cars, and trestle. The plant, it is stated, will be operated by electricity. The Wellman-Seaver-Morgan Co., Cleveland, Ohio, have the contract.

Winnipeg Terminals.—In connection with the reports as to the laying out of new freight terminals some miles out of Winnipeg. We understand that a comprehensive scheme for providing additional facilities is under contemplation. Nothing, however, has been decided, either as to location, or the area of the yards.

Regina to International Boundary.—It is not the present intention to build a line from Regina, Sask., to the International boundary, as stated in press reports.

Asquith to Battleford, Sask.—A press dispatch, Dec. 15, states that it is the company's intention to build a line from near Asquith to Battleford, Sask., and thence across the river to North Battleford.

Swift Current to Bassano.—Press reports state that plans have been approved for a line from Swift Current, Sask., to Bassano, Alta.; that construction is in progress, and that when completed it will form the main route for east and west traffic, instead of the present route via Medicine Hat. A branch line has been built from Swift Current northwesterly for 45 miles, and we understand that it may be projected on to a point on the Calgary section. This branch is built to a 0.4 gradient so that if completed certain traffic might be routed over it, as it would be an easier line than the present one. If the line is completed through it will be only three or four miles shorter, instead of between 40 and 50 miles, as press reports state, than the present route.

Strathcona - Edmonton High Level Bridge.—Reports from Strathcona, Alta., state that it will take over 1,000 cars to transport the steel for the superstructure of the high level bridge on the line to connect Strathcona and Edmonton. There are, it is said, 400 carloads of material on the way, in addition to about 100 which had been unloaded to Dec. 8. The contractors have done considerable preparatory work, and it was expected that everything would be ready so that erection of the superstructure could be started Jan. 1, and proceed without any interruption.

F. W. Peters, Assistant to the Vice President, Winnipeg, is reported as having informed the Edmonton city council, Dec. 4, that it was expected to have the bridge completed by the end of 1912. Other bridges on the line connecting the two towns were expected to be completed in the spring.

Edmonton Terminals, etc.—The Edmonton city council, it is reported, expects to receive plans early in the new year, showing the layout of yards at North St., the plans of the station building, and for an office building on Jasper Ave.

Sedgewick Southerly.—Application is being made to the Dominion Parliament for authority to build a line from Sedgewick, on the Hardisty subdivision, southerly to tp. 40 or 41, range 12 or 13, west of the 4th meridian, Alta.

Calgary Shops.—S. E. Junkin, Vice President of Westinghouse, Church, Kerr Co., New York, was in Winnipeg, Dec. 12, in consultation with George Bury, Vice President and General Manager, C.P.R. In a subsequent interview Mr. Junkin is reported as having said that his firm had prepared plans for the preliminary layout of the shops at Calgary, Alta. The railway company had evinced a broad, generous policy in connection with the enterprise, and the shops would be the most nearly perfect of any railway shops on the continent. Every provision would be made for the prompt handling of the work, and for the convenience of the workmen. What his company would have to do in the future in connection with the building of the shops, would depend wholly on the wishes of the C.P.R.

Winnipeg papers, Dec. 15, stated it was announced that morning, that the contract for building the shops had been let to the Westinghouse, Church, Kerr Co. The plans, it is said, provide for the erection of a boiler house, locomotive shop, general stores building, power house, two freight car shops, two passenger car shops, pattern shop, foundry, planing mill, wheel and tender shop, electrical shop, besides a number of smaller buildings.

We were officially advised, by telegraph, Dec. 23, that a contract had been let to Westinghouse, Church, Kerr Co.

Kootenay Central Ry.—We are officially advised that a contract has been let to Foley Bros., Welch and Stewart for grading from Fort Steele to Skookumsbuck, B.C., 21 miles.

Coquitlam, B.C., Shops, Yards, etc.—F. F. Busteed, General Superintendent, in a recent interview, is reported to have said that the company was badly in need of additional yard and other space in Vancouver and vicinity, and that the clearing and construction work at Coquitlam would be rushed as fast as possible. M. P. Cotton and Co., Vancouver, were reported to have several groups of men at work clearing the site Dec. 8.

C.P.R. Hotels.—G. M. Bosworth, Vice President, whose jurisdiction was recently extended to include the hotel system, completed a trip of inspection over the line to Vancouver, B.C., Dec. 15. The work at present being carried out on the hotels includes a new kitchen annex at the Algonquin, St. Andrews, N.B.; the enlargement of the Place Viger, Montreal; the enlargement of the Royal Alexandra, Winnipeg, and the enlargement of the Hotel Empress at Victoria. A permit has been applied for for the building of a new wing for the Hotel Vancouver, in Vancouver, and work has been started on a new hotel in Calgary, Alta.

The plan for the Calgary hotel shows that it will be 13 stories, rising to a height of 169 ft., and will have a frontage of 228 ft. and a depth of 164 ft. At first the hotel will be completed only as far as it is desired to open it for business as early as possible. The building is beautifully laid out, and, it is expected, will afford ample accommodation for years to come. The frame will be of steel with reinforced concrete floors and concrete foundations. The plans show terra cotta partitions. The building will be faced with cut stone and brick. The main roof will be used as a promenade. The main entrance is in the centre of the building, and the vestibule leads directly to the main office. To the west of the office is a large drawing room, and off this is a large dining room extending the whole depth of the building. There are also two large rotundas and a cafe on the ground floor. On the first floor there is a large banquet hall and ballroom; there will be about 400 bedrooms. Peter Lyall and Sons, of Montreal, have the contract for the

foundations. The contract for the superstructure is not let. Mr. Bosworth, during his trip west investigated the possibility of establishing houses at various points for the company's employees.

Port Moody-North Vancouver.—Press reports state that C.P.R. engineers are making a survey for an extension of the Port Moody line to Seymour Creek and North Vancouver, B.C.

Vancouver Improvements.—George Bury, Vice President and General Manager, arrived in Vancouver Dec. 6, on his first official trip of inspection over the western lines since his recent promotion. He stated that the object of his visit was to obtain all possible information so as to discuss future work of betterments, etc., with the President. The new station would be built on the site of the present station, and he expected that work would be started early in the spring. A portion of the yards at Coquitlam would be completed by the end of this year.

Esquimalt and Nanaimo Ry.—We are officially advised that during 1911 the company laid 26 miles of track on its Alberni extension, viz., from Cameron Lake to Port Alberni. It has under construction a line from McBride Jet. to Union Bay, 34.8 miles, a contract for the clearing of the right of way of which has been let to the Westholme Lumber Co., Victoria, and a branch from Duncan to Cowichan Lake, 16.1 miles, the grading contract for which has been let to Moore and Pethick, Victoria. Negotiations are in progress for securing a right of way for the Westholme branch to Osborne Bay, 3.3 miles.

The formal opening of the line to Alberni was fixed for Dec. 1, but owing to heavy snow storms, the work of finishing up a couple of bridges was delayed, and it was announced that the line would not be opened until Dec. 20. The Inspecting Engineer of the Board of Railway Commissioners made an official trip over it Dec. 7. The service arranged for the winter season is a tri-weekly one.

The Minister of Railways has approved location plans for the extension of the line from Black Creek to Duncan Bay, the construction of which will involve the building of bridges across two considerable rivers. The location plans for 3.25 miles of the line from mileage 47.5 on the main line to Osborne Bay, have been deposited in the Land Registry offices, Victoria, and application is being made to the Board of Railway Commissioners for approval.

Railway Finance, Meetings, Etc.

Acadia Coal Co.—Under the terms of a proposal made in the House of Commons, May 17, 1911, the railway from New Glasgow to Thorburn, U.S., owned by the Acadia Coal Co., and referred to as the Vale Ry., was to have been taken over upon certain terms. The proposal was not adopted. The Minister of Railways stated in the House of Commons, Dec. 7, that the Government did not intend to reintroduce the resolution, and had discontinued the passenger service which was being given under the agreement. (Sept., 1910, pg. 969.)

Alberta Ry. and Irrigation Co.—Notice has been given that the company will, on Jan. 1, pay off its 5% debenture stock outstanding at that date. The transfer books were finally closed Dec. 4.

Algoma Central and Hudson Bay Ry.—There has been listed on the London, Eng., Stock Exchange, an issue of £350,000 of 5% debenture stock.

Brockville, Westport and Northwestern Ry.—The whole of this company's property, including the line from Brockville to Westport, Ont., 45 miles, with the rolling stock and other equipment,

etc., was sold under a court order in Toronto, Dec. 11, to R. P. Ormsby, Assistant Secretary, Canadian Northern Ry., for \$250,000. Mackenzie, Mann and Co. have for some time held \$442,000 of bonds out of a total issue of \$450,000, and had a claim of about \$50,000 for accrued interest, but they were unable to locate the holder of the other \$8,000 of bonds, so that a sale of the property became necessary to give them a title to the property. Mackenzie, Mann and Co. also held over 90% of the common and preferred stock.

Calgary and Edmonton Ry.—A special meeting of the shareholders will be held in Montreal, Jan. 16, to create and issue bonds in respect of the extension of its Lacombe branch 125 miles easterly from the end of the 100 miles in respect of which bonds have already been issued; bridge bonds in respect of the branch line from Strathcona to Edmonton, including the high level bridge over the Saskatchewan River and its approaches; and to approve the form of the respective mortgages to be given to secure payment of same.

Canadian Northern Ontario Ry.—Lazard, Bros. and Co. issued a prospectus in London, Eng., Dec. 7, of £7,000,000 3½% first mortgage debenture stock of the C.N.O.R. Co. unconditionally guaranteed as to principal and interest by the Dominion Government, repayable May 19, 1961. The issue price was 93. It is secured by a first mortgage on about 970 miles of railway now under construction. The proceeds are to be used for the construction of the Montreal-Port Arthur line.

Canadian Northern Pacific Ry.—A prospectus was issued in England recently of £1,438,356 first mortgage 4% guaranteed debenture stock, principal and interest unconditionally guaranteed by the British Columbia Government, and is further secured by a first mortgage on the railway between Vancouver and the British Columbia-Alberta boundary and certain other lines. The issue price was 99.

Canadian Pacific Ry.—Shareholders of record Jan. 2 have the right to subscribe for the \$18,000,000 of new capital stock to be issued at \$150 on the basis of one new share for every ten held, the right to subscribe expiring Feb. 13. The payment for the stock is to be made:—20% on or before Feb. 13, 20% on April 12, 20% on June 14, 20% on Aug. 16, and 20% on Oct. 18.

Dominion Atlantic Ry.—Estimated gross earnings for Nov., from passengers, \$47,800; from freight, \$79,700; total, \$127,500.

Grand Trunk Ry.—London, Eng., financial papers state that the recent issue of £1,250,000 of 4% guaranteed stock, issued under the power of the G.T.R. Act of 1909, has been over subscribed.

Kaslo and Slocan Ry.—Following are the officers and directors for the current year:—President, J. Anderson; Vice President, H. Giegerich; Manager, J. L. Retallack; Secretary-Treasurer, W. H. Burgess; other director, O. T. Stone. The company has acquired the line from the Great Northern Ry.

Lake Superior Corporation.—Application has been made to the New York State Exchange to list \$40,000,000 of the capital stock. The company owns the Algoma Central and Hudson Bay Ry., the Algoma Eastern Ry., the electric railways in Sault Ste. Marie, Ontario and Michigan, and a number of steamboats plying on the Great Lakes, in addition to a number of industrial concerns.

Quebec Central Ry.—Gross earnings for Oct., \$120,891.61; expenses, \$78,280.07; net earnings, \$42,611.54, against \$99,773.68 gross earnings; \$65,296.41 expenses; \$34,477.27 net earnings for Oct., 1910. Aggregate gross earnings for four months ended Oct. 31, 1911, \$510,263.07;

expenses, \$323,441.27; net earnings; \$186,821.80, against \$463,867.69 aggregate gross earnings; \$294,593.02 expenses; \$169,274.67 net earnings for same period 1910.

Quebec Central Ry.—In connection with the application to the Quebec Legislature for the confirmation of the lease of the company's line to the C.P.R., the company desires authority to issue stock bearing interest at 3½% redeemable in 50 years, to replace the existing 8% second debenture stock; to issue 5% debenture stock or bonds repayable in 50 years to take the place of the present 7% income bonds, to permit the changing of the par value of its present shares to £1 or multiples thereof; to change the number of directors and the head office of the company.

St. Lawrence and Adirondack Ry.—A dividend at the rate of 4% was declared Dec. 13. This is the first dividend paid since Dec., 1908. There is \$1,615,000 of stock outstanding, all of which is held by the New York Central and Hudson River Rd.

St. Mary's and Western Ontario Ry.—The second mortgage bonds of this company, which is leased to the C.P.R., are held by the municipalities of Embro, East Missouri, and St. Marys, among other holders. The rental paid by the C.P.R. covers the interest of the first mortgage bonds. The C.P.R. holds or controls the capital stock, and has made an offer to retire the second mortgage bonds at 35% of the face value. The St. Marys town council favors accepting the offer and has submitted a by-law to that effect to the taxpayers, but the other two municipalities are not disposed to accept any offer at present.

Temiscouata Ry.—Profit for Oct., 1911, \$2,785, against \$4,897 for Oct., 1910.

Teniskaming and Northern Ontario Ry.—Revenue for Oct., 1911, \$212,318.83; expenditure, \$108,583.65; balance, \$103,735.18; ore royalties, \$889.87; net revenue, \$104,625.05; less hire of equipment, \$3,684.60, and outside operations \$610; net income, \$100,330.45. Total revenue for 12 months ended, Oct. 31, \$1,780,964.83; expenditure, \$1,181,998.63; balance, \$598,966.20; ore royalties, \$17,060.56; income from hire of equipment, \$6,283.93; net revenue, \$622,310.69; less hire of equipment, \$25,364.64, and outside operations \$3,793.69; net income, \$593,152.69.

Temiskaming and Northern Ontario Ry.—Sir James Whitney, Premier of Ontario, stated in a speech recently that the G.T.R. is to pay the T. and N.O.R. \$300,000 a year for running rights between North Bay and Cochrane, Ont. The G.T.R. will also pay a proportion of the maintenance expenses.

Wabash Rd.—As the result of a friendly suit, F. A. Delaw, President; G. H. Peryor, Vice President, and W. K. Bexley have been appointed by the U.S. court at St. Louis, Mo., receivers for the company, and W. H. Blodgett, the company's general counsel, was appointed solicitor to the receivers. The General Manager is reported as having stated, Dec. 19, that the receivership will in no way affect the operation of the line. The company jointly operates the G.T.R. Southern Division from the St. Clair River to the Niagara River.

The Board of Railway Commissioners has issued an order requiring that all railway companies subject to its jurisdiction file by Jan. 15 copies of all existing contracts with their cartage agents for the cartage of freight at so-called cartage points, with maps showing the cartage limits, and thereafter file from time to time any new contracts or modifications of existing ones, or of cartage limits.

Railway Rolling Stock Notes.

The Minneapolis, St. Paul and Sault Ste. Marie Ry. has ordered 750 box cars.

The St. Lawrence and Adirondack Ry has ordered a mogul locomotive from the Baldwin Locomotive Co., Philadelphia, Pa.

The Duluth, Winnipeg and Pacific Ry. (C.N.R.) has added 10 refrigerator cars and 20 stock cars to its rolling stock. We have already given details of these.

The Canada Iron Corporation, which controls the Northern New Brunswick and Seaboard Ry., has ordered a double ended snow plough from the Canadian Car and Foundry Co., Montreal.

An unconfirmed press report states that the G.T.R. will spend about \$500,000 in improvements in its mechanical department between now and the spring, and that it will build 30 locomotives, mostly in its Montreal shops.

The Canadian Northern Ry., between Nov. 15 and Dec. 15, ordered 250 box cars and 250 steel underframe flat cars from the Canadian Car and Foundry Co., Montreal, and one rotary snow plough from the Montreal Locomotive Works.

Regarding recent reports to the effect that the Central Vermont Ry. is to place gasoline cars on its West River line, we are officially advised that the matter is under consideration, but is not in a sufficiently advanced state to justify any announcement at present.

The Canadian Northern Ry., between Nov. 15 and Dec. 15, received the following additions to rolling stock: 62 box cars and three sleeping cars from the Canadian Car and Foundry Co., Montreal; 90 box cars from the Crossen Car Co., Cobourg, Ont., and 220 box cars from the Nova Scotia Car Works, Halifax, N.S.

The Intercolonial Ry. has ordered five cabooses to be built at its Moncton shops, and has received five cabooses and 25 platform cars from its Moncton shops; one refrigerator car from the Canadian Car and Foundry Co., five Pacific type locomotives from the Canadian Locomotive Co., and seven box cars, 60,000 lbs. capacity.

The C.P.R., between Nov. 14 and Dec. 14, received the following additions to rolling stock, two double track wooden snow ploughs, six flangers, and two D.10 locomotives from its Angus shops, Montreal; 15 steel single track snow ploughs from the Canadian Car and Foundry Co., Montreal, and one N.3 locomotive from the Canadian Locomotive Co., Kingston, Ont.

The C.P.R., between Nov. 14 and Dec. 14, ordered 2,500 steel frame box cars (mentioned in our last issue), from the Canadian Car and Foundry Co., Montreal; one flanger from its Angus shops, Montreal, and 2,000 steel frame box cars, 90 tank cars and 10 sleeping cars from the United States. Since the last mentioned date it has also ordered 14 steel underframes for Lidgerwood unloaders, from the Canadian Car and Foundry Co., Montreal.

The chief details of the Lidgerwood contractor's flat car which F. H. Hopkins and Co. have ordered from the Canadian Car and Foundry Co., as mentioned in our last issue, are as follows:—
Length over end sills 33 ft.
Width over side sills 9 ft. 8 ins.
Width over flooring 9 ft. 3 ins.
Truck centres 23 ft.
Body bolsters Simplex
Air brakes Westinghouse H.C. 812
Couplers Janney
Truck type Diamond arch bar, 60,000 lbs. capacity
Truck bolsters and brake beams Simplex
Brake shoes Cast iron
Journal boxes Cast iron
Journal bearings M.C.B.

Following are chief details of the five Pacific type locomotives, class G2, which

the C.P.R. is building at its Angus shops, Montreal, as mentioned in our last issue:
Weight on drivers 142,000 lbs.
Total weight of engine 218,000 lbs.
Weight of loaded tender 140,000 lbs.
Tender capacity, water 5,000 imp. gals.
Tender capacity, coal 12 tons
Heating surface, firebox 175 sq. ft.
Heating surface, tubes 2,730 sq. ft.
Heating surface, total 2,905 sq. ft.
Superheater surface 539 sq. ft.
Total all heating surfaces 3,444 sq. ft.
Grate area 45.6 sq. ft.
Cylinders 22½ by 28 ins.
Driving wheels 69 ins.
Brake equipment Westinghouse E. T. 6
Lubricator Detroit No. 22
Valve gear Walschaert
Boiler pressure 200 lbs.
Superheater Vaughan and Horsey

Following are chief details of the 2,500 box cars which the C.P.R. is having built by the Canadian Car and Foundry Co., Montreal, as mentioned in our last issue:—

Length over all 38 ft. 5½ ins.
Truck centres 26 ft. 10 ins.
Extreme width 9 ft. 3½ ins.
Height, top of rail to top of brake wheel 13 ft. 10 ins.
Side door openings 5 ft.
Draft springs M.C.B. Class G
Couplers Simplex cast steel
Air brakes Westinghouse K.C. 812
Trucks C.P.R. standard, 40-ton arch bar with Barber rollers
Wheels Standard cast iron, 33 ins.
Axles M.C.B. steel, 5 by 9 ins.
Journal bearings M.C.B.
Journal boxes McCord
Truck springs C.P.R. standard
Brake beams and holsters Simplex
Side bearings Susemihl
Journal bearing wedges M.C.B. drop forged
Brake shoes Steel back

Following are chief details of the two six wheel switching locomotives, class U3d, which the C.P.R. is building at its Angus shops, Montreal, as mentioned in our last issue:—

Weight in working order 137,000 lbs.
Weight of tender loaded 90,000 lbs.
Weight of tender light 44,000 lbs.
Tender capacity, water 3,500 imp. gals.
Tender capacity, coal 10 tons
Heating surface, firebox 138 sq. ft.
Heating surface, tubes 1,406 sq. ft.
Heating surface, total 1,544 sq. ft.
Grate area 29 sq. ft.
Boiler tubes, no. and diam. 234 2 ins.
Firebox Radiat stayed
Boiler, type Straight top
Boiler pressure 200 lbs.
Driving wheel base 11 ft. 6 ins.
Cylinders, diam. and stroke 18 by 26 ins.
Valves Piston, 11 ins.
Valve gear Walschaert
Driving wheels 52 ins.
Axles, driving 8½ by 10 ins.
Axles, tender 5 by 9 ins.
Brake equipment Westinghouse E.T. 6
Lubricator Detroit No. 22

Following are chief details of the 25 consolidation locomotives which the Grand Trunk Pacific Ry. has ordered from the Canadian Locomotive Co., Kingston, Ont., for delivery about May, as mentioned in previous issues:—

Weight on drivers 184,800 lbs.
Weight on engine loaded 211,200 lbs.
Weight of tender loaded 150,000 lbs.
Total weight, engine and tender 361,200 lbs.
Wheel base, driving 17 ft.
Wheel base, engine, total 25 ft. 9 ins.
Wheel base, engine and tender 57 ft. 3½ ins.
Heating surface, firebox 168.2 sq. ft.
Heating surface, tubes 2,757.1 sq. ft.
Heating surface, total 2,925.3 sq. ft.
Grate area 50.62 sq. ft.
Cylinders, diam. and stroke 23 by 30 ins.
Boiler, type Extended wagon top
Boiler, diam. first course 68½ ins.
Boiler, dome course 76 ins.
Boiler pressure 180 lbs.
Firebox, wide type 96½ by 75½ ins.
Driving wheels, diam. 63 ins.
Tender wheels 34 ins.
Tender capacity, water 8,000 U.S. gals.
Tender capacity, coal 10 tons
Tractive power 38,541 lbs.
Superheater Schmidt

The Robb Engineering Co., Amherst, N.S., have been appointed sole Canadian agents for the Parsons turbine built by C. A. Parsons & Co., Newcastle-on-Tyne, Eng., and which is used for driving generators, ventilating fans, etc. In the future the Robb Engineering Co. will manufacture some of the parts.

National Transcontinental Railway Construction, Etc.

We are officially advised that during 1911 track was laid on 280.25 miles, distributed as follows:—New Brunswick, 0.73 mile; Quebec, 155.31 miles; Ontario, 124.21 miles. Following are the chief contractors who are engaged upon the work:—District A, G.T. Pacific Construction Co., Montreal; J. W. McManus Co., Chipman, N.B.; W. Kitchen Co., Grand Falls, N.B.; Lyons and White, Edmonton, N.B. District B—M. P. and J. T. Davis, Quebec; Macdonnell and O'Brien, Montreal; G.T. Pacific Construction Co. District C—Macdonnell and O'Brien; G.T. Pacific Construction Co. District D—G.T. Pacific Construction Co.; E. F. and G. E. Fauquier, Ottawa; M. P. and J. T. Davis. District E—M. P. and J. T. Davis; E. F. and G. E. Fauquier; O'Brien, Fowler and MacDougall Bros., Dryden, Ont. District F—O'Brien, Fowler and MacDougall Bros.; J. D. McArthur, Winnipeg.

New Brunswick papers give details of a trip made over the line from Edmonton to Moncton, by a contractor's train Nov. 30. It is stated that the track was in excellent condition, and that, with the exception of stations and terminals, the line was complete.

The Minister of Railways stated in the House of Commons, Dec. 4, that the commissioners reported as follows:—"The engineers advise that the portion of the line in New Brunswick will be completed by Sept., 1912, and the portion in Quebec from the New Brunswick boundary to the St. Lawrence river will be completed by Sept. 30, 1913."

The Minister stated that the Government had not considered whether it would undertake the operation of the Moncton-Quebec section until the Quebec Bridge is completed.

The House of Commons has directed that a return be brought down giving "copies of all papers, correspondence and orders-in-council in connection with the awarding of the contract for the building of the N.T.R. station at Quebec, and all orders suspending work on the same. A press report states that the Government has under consideration the desirability of abandoning the Champlain market as the site of the station.

The Minister of Railways stated in the House of Commons, Nov. 29, that the question of building a line from the N.T.R. into Montreal to the exclusion of the G.T. Pacific Ry., had not been under consideration by the Government. He also stated that a subsidy had been applied for to aid in the building of the line. Such a subsidy was available, having been voted in 1908, but it had not been promised to the G.T. Pacific Ry. or to any other company.

The Commissioners will receive to Jan. 10 tenders for the supply of 14,468 gross tons of 80-lb. steel rails, and the necessary rail fastenings, and to Jan. 3 for the pipe covering required for the equipment of the locomotive shops at Transcona, Man.

The lift span of the bridge over the Red River, at the foot of Lombard St., Winnipeg, is reported to have been completed. The necessary connections with the line at both ends have yet to be made. (Dec., 1911, pg. 1153.)

Grand Trunk Pacific Railway Construction, Etc.

The Dominion Parliament passed through all their stages, Dec. 5, acts extending the time for the construction of the National Transcontinental Railway, Western Division, the building of which, according to the agreement with the G.T. Pacific Ry., was to have been completed Dec. 1, 1911. The time extension is for one year for the Prairie section

tion and three years for the Mountain section. The act respecting the G.T.P.R. declares that the company has and shall continue to have all the powers originally conferred upon it as regards the uncompleted portions of the line, which are to be completed within such time as may hereafter be fixed by an order-in-council in accordance with the act granting an extension of time for the construction of the National Transcontinental Railway, passed on the same day—Dec. 5.

During 1911 the company laid 254

of Yellowhead Pass, 25 miles; from Tete Jaune Cache to Aldermere, B.C., 425 miles, and from mileage 100 to 235 east of Prince Rupert, 135 miles. These mileages cover the remaining portions of the main line upon which track had not been laid to Dec. 31, 1911. The contracts for this work, three, in number, are being carried out by Foley Bros., Welch and Stewart.

Construction was in progress on the following branch lines Dec. 31:—Harte-Brandon branch—from Harte, south-westerly for 25 miles; Regina-Boundary

Profile, Grand Trunk Pacific Railway, Winnipeg to Prince Rupert.

miles of new track, of which 99 miles were on the main line, from Pedley, Alta., to 25 miles west of Yellowhead Pass, B.C., and 155 miles on four branch lines as follows:—Melville-Regina branch—Balcarres to Regina, Sask., 61 miles; Prince Albert branch—Measham to Wakaw, Sask., 42 miles; Calgary branch—Red Deer River southerly for 22 miles; Coal branch—Bickerdike, Alta., for 30 miles southerly.

The work at present under construction and under contract on the main line covers from mileage 55 to 50 west

branch—from Regina for 136 miles southeasterly; Regina-Moose Jaw branch—from Regina to Moose Jaw, 40 miles; Moose Jaw northwesterly—from Moose Jaw northwesterly for 42 miles. Prince Albert branch—from Wakaw to Prince Albert, 45 miles; Battleford branch—from Biggar to Battleford, 48 miles; Cutknife branch—from Battleford westerly, 32 miles; Biggar-Calgary branch—from Biggar westerly, 104 miles; Calgary branch—from Perbeck to Calgary, 95 miles; Alberta Coal branch—from mileage 30 to mileage 56 south

of Bickerdike, 26 miles. The several contractors on these branch lines are:—J. D. McArthur Co., Winnipeg; Rigby, Hyland and Plummer, Winnipeg; Phelan and Shirley, Bickerdike, Alta; J. Dandelin, Battleford, Sask.; Lamereaux and Petersen, Omaha, Neb.; John Gunn and Sons, Winnipeg; Duncan McArthur, Winnipeg.

The following extensions on branch lines were under survey Dec. 31:—Cut-knife branch—from mileage 32 west of Battleford to Wainwright, 100 miles; Biggar-Calgary branch—from mileage 104 to 224, west of Biggar; Edson, northerly for 60 miles Mountain Park Coal branch—from mileage 36 south of Bickerdike for 32 miles; Regina boundary branch—from mileage 130 to 155.

We are advised that a contract has been let to the John S. Metcalf Co., Montreal and Chicago, Ill., for the draining and building of a 2,500,000 bush, concrete storage elevator at the Mission Island terminal, Fort William, Ont. The estimated cost of the building is \$500,000. This is the second storage unit of the G.T.P.R. elevator there and will bring the storage capacity of the elevator to a total of 5,750,000 bush. The ultimate plans of the grain handling facilities at this point as designed contemplate a total storage capacity of 40,000,000 bush.

The G.T. Pacific Branch Lines Co. is applying to the Saskatchewan Legislature to validate an agreement entered into with the city of Regina, Nov. 30, 1911.

Prince Rupert Terminals.—The company's plans for Prince Rupert, B.C., include a 20,000-ton floating dry dock, shore plant comprising a 1,200-kw. generating station, air compressors, machine shop, blacksmith and boiler shops, and a covered shipbuilding platform. (Dec., 1911, pg. 1153.)

Equipment of Snow Ploughs.

The Board of Railway Commissioners has notified railway companies under its jurisdiction to show cause at the sittings in Ottawa on Feb. 7, why they should not be directed to equip snow ploughs, in which men are required to ride for the purpose of operating the ploughs, as follows:—

Direct connection between the plough and the steam whistle of the locomotive, so that the man in charge of the plough can give proper whistle signals for railway crossings, stations, etc.

To equip each plough with air gauge and air controlling valve, also proper air connections between plough and locomotive, to enable man in charge to control the air brake, which he can apply in all cases of emergency.

That snow ploughs that are run as push ploughs, not fitted with cupolas, and having no men in charge, shall be fitted with air pipe connections between plough and locomotive, so that in case of accident, where plough is derailed and air connections broken, air will immediately apply automatically.

That all snow ploughs be equipped with automatic couplers.

British Columbia Railway Plans.—In a speech at Vancouver, Dec. 14, Premier McBride stated that the Government was considering a policy for the development of railways within the province, which would be laid before the Legislature soon after its opening. One of the subjects under consideration was the line through the centre of the province from Vancouver to Fort George.

Jas. Forrest, who has charge of the Toronto Ry. Co.'s accident department, has nearly recovered from his serious accident, and was able to get out on Dec. 25, when a serious accident occurred near the King St. sheds.

Canadian Northern Railway Construction, Betterments, Etc.

New Brunswick.—Press reports state that Sir Wm. Mackenzie and associates have secured control of 192 square miles in the oil bearing shale districts of New Brunswick. Sir William and G. G. Ruel, of the Canadian Northern Ry. legal department, met the New Brunswick Government, Dec. 1, and are reported to have discussed the development of the property. The question of railway accommodation in these oil fields is stated to be under consideration.

Canadian Northern Quebec Ry.—A press report states that surveys are being made for a line from St. Eustache to St. Jerome, Que., 16 miles, and from St. Justin to St. Stanislas, 60 miles.

Sir Wm. Mackenzie, President, C.N.R., was in Montreal, Dec. 12, and in an interview is reported to have said he would make no announcement regarding the proposed terminals there until his return from Europe. The company's representatives were at work on the details of the proposals.

Canadian Northern Ontario Ry.—The line under construction from Hawkesbury, Ont., to Montreal will run through the southern part of Two Mountains county, which is now without railway accommodation. The engineers in charge of construction opened an office in St. Eustache, Dec. 1, and work is being gone on with in that vicinity. The right of way has been cleared up to the river, and work has been started on the bridge to connect with St. Jesus. A second bridge will carry the line on to Montreal Island. It is stated that a connection will be made with the G.T.R.-Jacques Cartier line, so as to run trains into Bonaventure station, pending the building of the company's own terminals in Montreal. It is reported that considerably more than half the grading has been completed between St. Eustache and Hawkesbury, and it is expected to have the line completed by the end of the year. A new line from Hawkesbury into Montreal was put in operation early in 1911.

Westward from Ottawa, contracts have been let to J. P. Mullarkey for building the line from Ottawa to Pembroke, 90 miles, and to Angus Sinclair, C.E., for building the line from Pembroke to Capreol tp., 220 miles. This will carry the line to a connection with the Toronto-Sudbury line, and its extension, which will form part of the trans-continental line.

From the end of the present constructed line near Gowganda Jct., the line is under contract to Port Arthur. Steel is reported to have been laid to 61 miles beyond Sudbury Jct. Plans and books of reference for the route between mileage 68.7 and 76.5; between mileage 79 and 80.8, and between mileage 182.03 and 183.78 have been filed in the registry office at Sault Ste. Marie, Ont. The Board of Railway Commissioners has approved of revised location plans for the line in Nipigon tp., mileage 68.58 to 69.53; from mileage 194.52 to 203.24, and from mileage 534.72 to 535.01 (Pearl station) from Sudbury Jct.; and from mileage 48.8 to 50.5 from Port Arthur, in Dorion tp.

The Board of Railway Commissioners has approved of revised location plans for the Toronto-Ottawa line, in the vicinity of Stonehouse Lake, Storrington tp., mileage 174.67 to 175.35 from Toronto.

The plans for the company's lines in the northwest part of Toronto and out through Lambton have been before the Board of Railway Commissioners. Orders were made as to the provision of subways, and it is said that a new route alongside the C.P.R. will be utilized through Lambton. The company,

through a subsidiary—the Toronto, Niagara and Western Ry. Co.—is reported to be buying right of way in and through Hamilton. Press reports state that the surveys for the westerly extension of the line are being made from Hamilton via Brantford, and London to Sarnia, Ont.

Canadian Northern Ry.—A new coal dock is under construction at Port Arthur, Ont., for the Canadian Northern Coal Dock Co., at a reported cost of \$400,000. The new plant, which will have a capacity of 60,000 tons of hard coal and 250,000 tons of soft coal, will have a frontage of 600 ft. at the head of the docks. The contract was said to have been let to the Barnett-McQueen Co., Dec. 7.

An extension of the Thunder Hill branch to Princeville, Sask., 74 miles, has been opened for traffic. The Board of Railway Commissioners has authorized the opening for traffic of the Maryfield extension from Radville to Bengough, Sask., of 45 miles, and the extension of the branch to Calgary from Warden, mileage 109.5, to Drumeller, mileage 172.63, Alta.

It is reported that some 400 miles of grading was completed in Alberta during 1911. The principal part of the construction has been in the Edmonton district. It was expected to complete by Dec. 31 the line to Athabasca Landing, of which 56 miles was built during the year. The other work done includes 166 miles of grading towards the Yellow-Head Pass; 20 miles of grading on a line in the direction of the Peace River; over 100 miles of grading has been done on the line from Stettler via Red Deer to the Saskatchewan River and over 50 miles between the river and Rocky Mountain House; the line to Calgary has been put in operation as far as Drumeller, while the grading has been pushed for some miles further, and considerable grading has been done on the line between Strathcona and Camrose.

The town of Macleod is applying to the Alberta Legislature for the validation of a bylaw closing certain streets, avenues and lanes crossing the C.N.R. right of way, station grounds and yards, conveying certain lands to the company, and an agreement made in respect to the building of the line in the town.

Canadian Northern Pacific Ry.—M. H. McLeod, General Manager and Chief Engineer, C.N.R., was in Vancouver, B.C., Dec. 6. He is reported to have stated that it was proposed that the company's engineers would resume location survey work in the spring in the direction of the Pine River Pass. A route map had already been filed at Ottawa, and the line through northern British Columbia would be built under one of the C.N.R. subsidiary companies' charters. While Stewart, on the Portland Canal, had been spoken of as the probable terminus, nothing had been determined. In connection with the statement it may be mentioned that the Canadian North Eastern Ry. has been built inland from Stewart to Bear River, and C. Hoard, with an engineering party, returned to Victoria at the end of Nov. from a surveying trip along the Naas Valley to Hazelton, B.C.

While on the Pacific Coast, Mr. McLeod made an inspection of the work going on at Port Mann, and also of probable routes between that place and Vancouver. Track has been laid on the line from Port Mann, easterly to Chilliwack, 46 miles, and work will be continued all winter on sections of the line between that point and the eastern boundary of the province, to which point the line is being built from Edmonton, Alta. The working force was increased during Dec., and it is expected it will be still further added to during the winter, as Mr. McLeod stated that it

was the company's desire to have the line completed through by the end of 1913.

We are officially advised that a contract has been arranged with J. A. L. Waddell, Kansas City, Mo., for plans for two bridges across the Fraser River, and four across the Thompson River, and for supervising the erection of the same. Nothing has as yet been decided as to the design of these bridges.

Vancouver Island.—We are officially advised that the contract for the building of the line on Vancouver Island from mileage 60 to 100 has been let to Moore and Pethick, Victoria, B.C. This section will carry the line to the summit just beyond the upper end of Cowichan Lake. The construction is rather heavy, as it is to be built to a maximum gradient of 0.4%. No track has yet been laid on the line out of Victoria. The survey and construction work is now entirely in charge of D. O. Lewis, as District Engineer, G. B. Hughes, heretofore engineer of surveys, having resigned to enter the British Columbia Electric Ry. Co.'s service. (Dec., 1911, pg. 1145.)

Alberta Legislation for Railway Construction.

The Premier informed the Alberta Legislature Dec. 7, that the Government would submit, during the session, a proposition providing for the construction, extending over some years, of the following lines of railway: (1) From Edmonton to Grand Prairie. (2) From Athabasca Landing to Peace River Landing. (3) From Athabasca Landing to the vicinity of Fort McMurray, with a branch line to Lac la Biche. (4) From Edmonton along the north shore of the Saskatchewan River to the eastern boundary of the province near Cold Lake. (5) From Bruderheim, running east and north of the Canadian Northern Ry. main line, to range 5, and then to the southern boundary of the province between ranges 5 and 6. (6) A continuation of the Peace River line, and the line already arranged for between Camrose and Strathcona down to the eastern boundary of the province to meet the line coming up from Winnipeg and Regina, Sask. (7) A line from Strathcona, south of the Saskatchewan River to about 18 miles west of the Calgary and Edmonton Ry., thence south to the neighborhood of Pincher Creek, at an average distance of three townships west of the C. and E. Ry. (8) A line from the Stettler-Brazeau line starting about 18 miles east of the Calgary and Edmonton Ry. and running south to meet the Canadian Northern Ry. line through the Goose Lake district into Calgary, near Swallowvale, north of the C.P.R.

A bill was submitted to the Legislature on the same day, authorizing the borrowing of \$5,000,000, of which \$4,000,000 would be devoted to the extension of railways.

Replying to questions, the Premier said the lines to be aided would be built by the Canadian Northern Ry. and the G.T. Pacific Branch Lines Co. The province had already guaranteed the C.N.R. bonds in respect of 470 miles of line, of which 447 miles had been graded, and on which 284 miles of track had been laid. Passenger and freight services were being operated over 207 miles of the lines so built. The province had paid to the company \$4,073,984 of the proceeds of the guaranteed bonds. The province had guaranteed the G.T. Pacific Branch Lines Co.'s bonds for building 193 miles of line. This mileage had been graded, 104 miles of track had been laid, and trains were being operated over 70 miles. The province had paid out \$1,614,659.80 of the proceeds of the guaranteed bonds.

TRANSPORTATION APPOINTMENTS.

The information under this head, which is almost entirely gathered from official sources, is compiled with the greatest care, so as to ensure absolute accuracy. Anyone who may notice any error in our announcements will confer a favor by advising us.

Algoma Central and Hudson Bay Ry.—A. H. Chitty, heretofore Assistant Treasurer, has been appointed Treasurer. Office, Sault Ste. Marie, Ont.

Canada and Gulf Terminal Ry.—Rene Dupont, heretofore Secretary-Treasurer, has been appointed Traffic Manager.

F. W. Rous has been appointed Secretary-Treasurer, vice Rene Dupont. Office, Montreal.

Canadian Northern Pacific Ry.—D. O. Lewis, heretofore Engineer of Construction for lines on Vancouver Island, has also been appointed Engineer of Surveys, vice G. B. Hughes, resigned to enter the B.C. Electric Ry. Co.'s service. Office, Victoria, B.C.

Canadian Government Railways.—An unconfirmed press report of Dec. 21 stated that the Minister of Railways was looking for an expert railway man and engineer as deputy head for the Railway and Canal Department, and that the position had been offered to F. P. Gutelius, M. Can. Soc. C.E., General Superintendent, C.P.R. Eastern Division. The same report stated that the present Deputy Minister, A. W. Campbell, M. Can. Soc. C.E., would be placed in charge of a branch to administer the "good roads" work proposed to be taken up by the Government.

Canadian Northern Quebec Ry.—Quebec and Lake St. John Ry.—J. S. Jackson, heretofore in Canadian Car and Foundry Co.'s service, has been appointed General Car Foreman, C.N.Q.R. and Q. and L. St. J.R. Office, Joliette, Que.

Canadian Northern Ry.—The appointments of J. R. Cameron as Assistant General Manager, and A. E. Warren and A. Wilcox as General Superintendents, were announced in our last issue. The following additional information in regard to them has been received since: J. R. Cameron, heretofore General Superintendent all lines, has been appointed Assistant General Manager, with jurisdiction over matters pertaining to operation and maintenance. Office, Winnipeg.

A. E. Warren, heretofore Superintendent, District 2, Winnipeg, has been appointed General Superintendent, Central Division, consisting of line Port Arthur to Regina and to Dauphin, not including the two last mentioned terminals. Office, Winnipeg.

A. Wilcox, heretofore Assistant General Superintendent, Winnipeg, has been appointed General Superintendent, Western Division, consisting of lines north of Regina and west of Dauphin, including those terminals. Office, Edmonton, Alta.

J. M. Grieve has been appointed Chief Inspector, Sleeping, Dining and Parlor Cars. Office, Winnipeg.

D. Robinson has been appointed Inspector, Sleeping, Dining and Parlor Cars. Office, Winnipeg.

S. C. Felgate has been appointed agent, Sleeping, Dining and Parlor Cars, with jurisdiction over Edmonton and Prince Albert, and all employees stationed at, or running in and out of Saskatoon. Office, Saskatoon, Sask.

J. R. Miller, heretofore machinist, Winnipeg shops, has been appointed Locomotive Foreman, Radville, Sask.

W. A. Cowan, formerly Resident Engineer at Farnham, Que., has been appointed one of the assistant engineers in the Assistant Chief Engineer's office, Montreal, and not Inspecting Engineer, as stated in our last issue.

Canadian Pacific Ry.—F. W. Cooper, heretofore Resident Engineer, London, Ont., has been appointed Resident En-

gineer, District 2, Eastern Division, including Montreal terminals. Office, Montreal.

F. J. Mahon, heretofore Superintendent of Telegraphs, Atlantic Division, St. John, N.B., has been appointed Superintendent of Telegraphs, Eastern Division, vice J. F. Richardson, transferred. Office, Montreal.

J. Fletcher, heretofore Superintendent of Telegraphs, British Columbia Division, Vancouver, is reported to have been appointed Superintendent of Telegraph Traffic, Montreal.

F. B. Tapley, heretofore Resident Engineer, Brownville Jct., Me., has been appointed Resident Engineer, District 2, Ontario Division, London, vice F. W. Cooper, transferred to Eastern Division.

H. R. Miles, Resident Engineer, North Bay, Ont., has had his territory extended to include that hitherto in charge of H. T. Ruhl, recently transferred from Sudbury, Ont., to Farnham, Que., as announced in our last issue.

C. Erickson has been appointed acting Roadmaster, White River Subdivision, Lake Superior Division, White River, vice T. Lannin, assigned to other duties.

T. Allison has been appointed Sleeping and Dining Car Agent, North Bay, Ont., vice W. Morrison, transferred.

W. Morrison, heretofore Sleeping and Dining Car Agent, North Bay, Ont., has been appointed Sleeping and Dining Car Agent, Fort William, Ont., vice C. Mead, promoted.

J. T. Tait, heretofore Superintendent of Telegraphs, Manitoba Division, Winnipeg, has been appointed Assistant to General Superintendent of Telegraphs, Western Lines. Office, Winnipeg.

J. McMillan, heretofore Superintendent of Telegraphs, Alberta Division, Calgary, has been appointed Superintendent of Telegraphs, Manitoba Division, vice J. T. Tait, promoted. Office, Winnipeg.

G. S. Morris, heretofore first trick dispatcher, main line, Brandon, Man., has been appointed Chief Dispatcher there, vice J. K. Savage, appointed Superintendent, District 2, Saskatchewan Division.

N. Fletcher, heretofore in the Superintendent's office, Brandon, Man., has been appointed Accountant, Districts 3 and 4, Manitoba Division, vice H. H. Godard, transferred to Revelstoke, B.C.

E. Ashworth has been appointed Storekeeper at Minnedosa, Man. This is a new position.

The Saskatchewan Division is now being operated in three divisions. Following are details of the territory covered by each, and list of staff of the new district 2:—District 1—Moose Jaw to Swift Current, Outlook subdivision, and Portal subdivision, not including Weyburn. Superintendent, E. W. DuVal. Office, Moose Jaw. District 2—Broadview to Moose Jaw, not including either place, Moose Mountain subdivision (not including Arcola), Weyburn, Forward, and Colonsay subdivisions (not including Colonsay), and Bulyea subdivision (not including Bulyea). Superintendent, J. K. Savage, heretofore Chief Dispatcher, Brandon, Man.; chief clerk, G. G. Hamilton, heretofore in General Superintendent's office, Moose Jaw; Trainmaster, W. R. Boucher, heretofore Trainmaster, Moose Jaw; Chief Dispatcher, G. T. Coleman, heretofore Assistant Chief Dispatcher, Moose Jaw; District Master Mechanic, W. Webb, heretofore locomotive engineer, Brandon, Man.; Roadmasters, J. Hollonquist, heretofore Roadmaster at Moose Jaw; G. Sandstrom, heretofore Roadmaster at Strassburg; L. Rinstad and T. Roulston; Locomotive Foreman, A. S. McDonald. The offices of all those mentioned, except T. Roulston, who is located at Weyburn, are at Regina. District 3—Wynyard subdivision (not including Bredenburg).

Last Mountain subdivision (not including Neudorf and Lanigan), Saskatoon, Battle River and Kerrobert subdivisions. Superintendent, H. H. Boyd. Office, Saskatoon.

C. H. Zerbach has been appointed Car Foreman, Moose Jaw, Sask., vice A. Cameron, resigned.

V. B. Beardmore has been appointed Storekeeper, Swift Current, Sask., vice W. McGimpsey, resigned.

T. B. MacSwain has been appointed Storekeeper, Kamloops, B.C., vice G. Fitzpatrick, transferred to Sutherland, Sask.

G. Fitzpatrick, heretofore Storekeeper, Kamloops, B.C., has been appointed Storekeeper, Sutherland, Sask., vice G. Burke, resigned.

R. H. Brown has been appointed Night Foreman at Sutherland, Sask., vice J. H. Kepple, who has returned to the Sutherland shops as machinist.

D. Coons, heretofore Inspector of Telegraphs, Manitoba Division, Winnipeg, has been appointed Superintendent of Telegraphs, Alberta Division, vice J. McMillan, transferred to Winnipeg. Office, Calgary.

C. Mead, heretofore Sleeping and Dining Car Agent, Fort William, Ont., has been appointed Assistant Superintendent, same department, vice A. J. Macdonnell. Office, Calgary, Alta.

M. Newlands, heretofore Roadmaster, Red Deer subdivision, Alberta Division, has been appointed Roadmaster, District 3, Alberta Division, vice J. Todd, transferred.

T. Riordan has been appointed Roadmaster, Red Deer subdivision, Alberta Division, vice M. Newlands, transferred.

J. Todd, heretofore Roadmaster, District 3, Alberta Division, has been appointed Roadmaster, Edmonton section, Alberta Division.

T. Bradshaw has been appointed Roadmaster, Calgary Terminals.

D. McTaggart has been appointed Bridge and Building Inspector, Calgary, Alta., vice W. McKinty, transferred.

W. J. Shepherd has been appointed Car Foreman at Revelstoke, B.C., vice G. Donley, transferred.

C. E. Lundell has been appointed Assistant Car Foreman at Revelstoke, B.C., vice J. W. Chesterman, transferred.

F. X. LaPrairie, heretofore Assistant and Wrecking Foreman, Vancouver, B.C., has been appointed Car and Wrecking Foreman at North Bend, B.C. This is a new position.

J. F. Richardson, heretofore Superintendent of Telegraphs, Eastern Division, Montreal, has been appointed Superintendent of Telegraphs, British Columbia Division, vice J. Fletcher, transferred. Office, Vancouver.

Duluth, Rainy Lake and Winnipeg Ry.—C. W. Houston, heretofore Chief Dispatcher at Virginia, Minn., has been appointed Superintendent, vice M. B. Murphy, appointed Superintendent, District 2, C.N.R., Winnipeg, as announced in our last issue. Office, Virginia, Minn.

Duluth, South Shore and Atlantic Ry., Mineral Range Rd.—A. B. Eldredge, heretofore Vice President and General Attorney, has been elected President, vice W. F. Fitch, President and General Manager, resigned. Office, Marquette, Mich.

W. W. Walker, heretofore General Freight Agent, has been appointed Vice President and General Manager, vice A. B. Eldredge, Vice President, elected President. He will have charge of all matters pertaining to operation and traffic. Office, Duluth, Minn. He has also been elected a director, in place of W. R. Baker, Assistant to the President, and Secretary, C.P.R., resigned.

S. R. Lewis, heretofore Assistant General Freight Agent, has been appointed General Freight Agent, vice W. W.

Walker, promoted. Office, Duluth, Minn.

W. D. Johnson, heretofore General Roadmaster, has been appointed Assistant Superintendent, vice A. M. Sutherland, resigned. Office, Thormaston, Mich.

Grand Trunk Pacific Ry.—R. Gardiner, heretofore Locomotive Foreman, Melville, Sask., has been appointed Locomotive Foreman, Transcona, Man., vice A. C. Loudon, resigned on account of ill health.

W. Molson MacPherson, Quebec, President, Molson's Bank, has been elected a director G.T.P.R., in place of Hugh A. Allan, resigned, owing to his now residing in England.

W. Moher, heretofore locomotive driver, has been appointed Road Foreman of Locomotives, Districts 1, 2 and 3 and Melville branches, vice A. McTavish, assigned to other duties.

The following agents have been appointed:—Cabot, Man., A. J. Cushing; Goodeve, Sask., H. A. Phillips; Landis, Sask., R. E. Patterson; Edgerton, Alta., D. M. Davis; Stony Plain, Alta., C. Reagh; Fort Qu'Appelle, Sask., C. W. Kemp.

Grand Trunk Pacific Ry., Grand Trunk Pacific Coast Steamship Co., Grand Trunk Ry.—A. E. McMaster, heretofore Agent, has been appointed General Agent in charge of Passenger and Freight Traffic in western British Columbia, north of Rivers Inlet, including Queen Charlotte Islands. Office, Prince Rupert.

Grand Trunk Ry.—James Edward, heretofore Travelling Freight Agent, Moncton, N.B., has been appointed Commercial Agent, there.

W. R. Germain has been appointed acting station master, Bonaventure station, Montreal, vice P. C. Caron, deceased.

J. D. Scott has been appointed Locomotive Foreman at Turcot, Montreal, vice H. Powers, assigned to other duties.

W. J. Nixon, Trainmaster, District 5, Eastern Division, has had his office moved from Montreal to Brockville, Ont., and his jurisdiction extended to the west semaphore at Brockville.

C. S. Cunningham, heretofore acting Superintendent, Western Division, has been appointed Superintendent. Office, Detroit, Mich.

J. C. Talmage, heretofore Travelling Car Service Agent, Detroit, Mich., has been appointed Trainmaster, Districts 25, 27 and 28, vice F. G. Bement, resigned. Office, Durand, Mich.

The following agents have been appointed:—Oshawa Jct., Ont., H. Barker; Kirkfield, Ont., R. G. Winters; Wyebridge, Ont., J. Mitchell; Sebringville, Ont., W. E. Cusson; Fergus, Ont., C. E. Fleming; Ottawa, Ont., R. O. Kenney. The station at Nipissing Jct. and the outside agency at Valleyfield, Ont., have been closed.

Intercolonial Ry.—W. A. Dube, Superintendent at Levis, Que., has been suspended by the Minister of Railways, pending an investigation into charges of partizanship, etc., that have been made against him. Emile Gelly, advocate, Quebec, who has been appointed to investigate charges of partizanship against Government officials in the province of Quebec, will hear the charges against Mr. Dube.

Jas. A. McDonald, of Halifax, N.S., and E. T. C. Knowles, of St. John, N.B., have been appointed to investigate charges against officials in Nova Scotia and New Brunswick respectively.

Press reports of Dec. 7 stated that J. A. Humble had been appointed Claims Agent, vice J. S. Leighton, but we were officially advised, Dec. 21, that no appointment had then been made.

A press report states that the tracer of lost cars has been suspended pending an enquiry.

Lehigh Valley Rd.—W. J. Hamilton, heretofore City Passenger and Ticket Agent, Niagara Falls, N.Y., has been appointed Canadian Passenger Agent, vice R. S. Lewis, deceased. Office, 8 King St. East, Toronto.

W. B. Prescott has been appointed City Passenger and Ticket Agent, Niagara Falls, N.Y., vice W. J. Hamilton, promoted.

Michigan Central Rd.—R. A. Barrett having been appointed Trainmaster, T. H. and B. Ry., Hamilton, Ont., the position of Assistant Trainmaster, M.C.R., St. Thomas, Ont., has been abolished.

Midland Ry. of Manitoba.—C. E. Defoe, Trainmaster, Northern Pacific Ry., Livingston, Mont., has been appointed Terminal Superintendent, M.R. of M. at Winnipeg. The appointment will go into effect when the G.N.R. service to Winnipeg over the M.R. of M. is put into force.

National Transcontinental Ry.—Duncan MacPherson, M. Can. Soc. C.E., heretofore Assistant Chief Engineer, has been appointed Assistant to the Chairman. Office, Ottawa. We were officially advised Dec. 20 that no appointment had then been made to succeed Mr. MacPherson as Assistant Chief Engineer.

Perc Marquette Rd.—W. L. Kellogg, heretofore Superintendent of Motive Power, Cincinnati, Hamilton and Dayton Ry., has been appointed Superintendent of Motive Power, P.M. Rd. Office, Detroit, Mich.

The line has been divided into five divisions, as follows:—Grand Rapids Division, F. Hartenstein, Superintendent, Grand Rapids, Mich.; Saginaw Division, A. R. Merrick, Superintendent, Saginaw, Mich.; Buffalo Division, W. K. Tasker, Superintendent, Port Huron, Mich.; Ionia Division, J. E. Church, Superintendent, Ionia, Mich.; Petoskey Division, W. H. Romoser, Superintendent, Traverse City, Mich.

The Buffalo Division comprises the lines Port Huron to Grindstone City, Palms to Port Hope, Poland to Sandusky, Port Huron to Hoyt, Bad Axe station and yard, Port Huron to Almont, and the ferry service at Port Huron, also the lines in Canada, namely:—Sarnia to Rondeau, Windsor to Walkerville Jct., Walkerville to St. Thomas, London to Port Stanley.

W. Madden, heretofore Division Engineer, Detroit, Mich., has been appointed Division Engineer, Buffalo Division. Office, Port Huron, Mich.

C. F. Weir, heretofore Supervisor of Bridges, St. Thomas, Ont., has been appointed Foreman of Bridges and Buildings, Buffalo Division. Office, Port Huron, Mich.

W. E. Shaffer has been appointed Foreman of Water Service, Buffalo Division. Office, Port Huron, Mich.

E. S. Stuart has been appointed Trainmaster, and F. P. Little, Chief Train Dispatcher, with jurisdiction over the portion of the Buffalo Division west of the Detroit and St. Clair Rivers.

R. M. Johnson has been appointed Trainmaster with charge of line between Grand Rapids and Detroit, including Detroit terminals. Office, Detroit.

Reid Newfoundland Co.—A. Rowsell has been appointed Roadmaster, Bonavista branch.

Toronto, Hamilton and Buffalo Ry.—R. A. Barrett, heretofore Assistant Trainmaster, Michigan Central Rd., St. Thomas, Ont., has been appointed Trainmaster, T. H. and B.R., Hamilton, Ont., vice G. M. Higginson, heretofore Trainmaster and Chief Dispatcher, who retains the latter position.

White Pass and Yukon Route.—O. L. Dickeson, Vice President and General Manager, left Vancouver, B.C., Dec. 9, for England, and press reports state that he will succeed the late S. H. Graves as President.

Steam Railway Track Laid in 1911.

In response to our request for information of the new track laid during 1911, we have received replies from nearly every railway which has been doing any building during the year, the most important line from which there is no reply being the Canadian Northern Ry., although we have replies from the Canadian Northern Ontario Ry. The table which follows is compiled from the information received. Where the name of a line is preceded by an asterisk the figures are estimated either by the company's staff prior to work being finished for the year, or in our office. It will be noticed that outside of the Canadian Northern, Canadian Pacific, Grand Trunk Pacific and National Transcontinental Railways about 250 miles were built by 14 different companies. From the figures at present available, and which are subject to revision, it would appear that a total of about 1,830 miles of new track were laid in 1911. The figures we published in March last showed the actual mileage laid in 1910 as 1,870.44.

Orders by the Board of Railway Commissioners.

The following have been issued in addition to those given on pp. 16 and 17.

15595 Dec. 12.—Authorizing Saskatchewan Government to build highway over C.P.R. in s.w. ¼ sec. 30, tp. 15, r. 13, w. 3 m.

15596 Dec. 9.—Suspending Wabash Rd. tariff 686 re baggage of excess size until parties can be heard.

15597 Dec. 12.—Approving location of C.P.R. station at Lydiatt, Man.

15598, 15599 Dec. 12.—Approving revised location of Dominion Atlantic Ry. from west side of St. George St., Annapolis, N.S., to west side of Allens Creek, 2,790.5 ft., and authorizing rebuilding of Allens Creek bridge.

15600 Dec. 14.—Approving C.N.O.R. plans for undercrossing of C.P.R. at Smiths Falls.

15601 Dec. 14.—Authorizing Esquimalt and Nanaimo Ry. to cross with its Cowichan Lake branch two highways in British Columbia.

15602 Dec. 13.—Authorizing C.N. Pacific Ry. to use crossing of C.P.R. Mission branch for construction purposes only until Feb. 29, 1912, pending installation of interlocker.

15603 Dec. 18.—Approving revised location of C.N.O.R. Montreal-Port Arthur line through Bristol, Clarendon and Litchfield tps., Que., mileage 162 to 176 from Montreal.

15604 Dec. 19.—Ordering C.N.O.R. to install improved type of electric bell at crossing near Brighton.

15605 Dec. 16.—Authorizing C.N.O.R. to build bridge over Blende River, at mileage 23.96 east of Port Arthur.

15606 to 15608 Dec. 18, 19.—Authorizing C.N.R. to cross with its Maryfield line public road between secs. 12 and 11, tp. 5, r. 8, w. 2 m., and with its Swift Current line 10 highways in Saskatchewan.

15609 Dec. 15.—Approving Alberta Central Ry. location from its main line 135.58 miles west of Red Deer to Big Horn Range coal fields, mileage 0 to 28.

15610 Dec. 19.—Authorizing G.T.P.R. to cross highway at mileage 137.2, r. 6, Cas-siar district, B.C.

15611 Dec. 18.—Approving plans of G.T.R. station at Stevensville, District 19, Southern Division.

15612 Dec. 19.—Authorizing C.P.R. to open for traffic its Swift Current to Brooks branch from mileage 0 to 33.

15613 Dec. 19.—Authorizing C.P.R. to operate until June 30, 1912, its Wilkie northwesterly branch from its Pheasant Hills branch, mileage 0 to 27.8 between Wilkie and Cutknife, Sask.

15614 Dec. 16.—Approving revised location of C.P.R. Lauder extension between mileage 32.28 and 54.63, Sask.

15615 Dec. 16.—Authorizing C.P.R. to cross with its Wilkie northwesterly branch, 14 highways between mileage 13.90 and 25.78, Sask.

15616 Dec. 18.—Authorizing C.N.R. to cross with its Maryfield line 16 highways in Saskatchewan.

15617 Dec. 13.—Approving overhead clearances of West Canadian Collieries, Ltd., for C.P.R. siding at Bellevue, Alta.

15618 Dec. 20.—Approving location of C.N.R. Grosse Isle extension, mileage 4.33 to 25.68, w.p.m., Man.

15619 Dec. 19.—Authorizing G.T.P.R. to cross highway at mileage 204.5, r. 6, Cas-siar District, B.C.

15620 Dec. 19.—Authorizing G.T.R. to build spur for joint use with C.N.O.R. on Don Esplanade, Toronto.

15621 Dec. 12.—Authorizing C.N.R. to build spur line to Hospital for Insane, North Battleford, Sask.

15622 Dec. 13.—Authorizing Dominion Atlantic Ry. to build spur from its Cornwallis Valley branch to Government Wharf, at Canning, N.S.

15623 to 15625 Dec. 15, 13, 9.—Authorizing C.P.R. to build spurs for Alberta Consolidated Coal Co., near Elcan ballast pit, Anderson and Rosenroll, near Olaton, Alta., and Wiens and Reimer at Foam Lake, Sask.

15626 Dec. 14.—Authorizing Esquimalt and Nanaimo Ry. to build spur on Vancouver Island, at mileage 47.5, from Victoria to near Crofton at mileage 0.78, Chemainus district, B.C.

15627 Dec. 18.—Recommending to Governor in Council for sanction, lease by C.P.R. of Alberta Ry. and Irrigation Co.

Changes in Baggage Regulations.

Some important changes in baggage regulations will go into effect on July 1, 1912. For some years the transportation companies have had great difficulty in handling extremely large sample and personal trunks, particularly the "innovation" or wardrobe trunk. Some commercial trunks are over 4 ft. square, while the wardrobe trunk is made so that it must stand upright, having bulging sides and top, and some times measuring 70 to 80 ins. in length. This trunk will take up the space of at least four ordinary trunks.

In the baggage car an aisle space must be maintained so that baggage may be handled en route, records taken, etc., and this space must be wide enough to permit of the passage of a fairly large man, or the pulling from the tier of an average sized trunk. Some baggage cars have only a clear width of a little over 100 ins. At a meeting of the Trans-Continental Passenger Association in Chicago in Jan. last it was recommended that for any single piece of baggage (excepting immigrant baggage checked at the port of landing), the greatest dimensions of which exceeded 40 ins., there would be a charge for each additional inch equal to the charge for 10 lbs. of excess baggage, and that any piece of baggage, the greatest dimensions of which exceed 70 ins., would not be accepted for transportation in baggage cars. A strong objection was made by a number of trunk manufacturers and other industrial interests in the United States, and to co-operate with them it was finally decided that commencing July 1, 1912, and until June 30, 1914, for any single piece of baggage (excepting immigrant baggage checked at the port of landing) the greatest dimensions of which exceed 45 ins., there will be an additional charge for each additional inch equal to the charge for 10 lbs. of excess baggage, and that after July 1, 1914, for any piece of baggage of any class (excepting immigrant baggage checked at the port of landing) the greatest dimensions of which exceed 40 ins., there will be an additional charge for each additional inch equal to the charge for 10 lbs. of excess baggage, and that no piece of baggage of any class, the greatest dimensions of which exceed 70 ins., will be accepted for transportation in baggage cars.

The Board of Railway Commissioners has passed an order suspending sine die the Canadian Northern Ry., Ottawa and New York Ry., and Wabash Rd. tariffs for baggage of excess size until all parties can be heard.

Steel Rail Orders.

The Canadian Pacific Ry. has ordered from the Algoma Steel Co. and the Dominion Iron and Steel Co. about 150,000 tons of steel rails.

The Grand Trunk Ry. gave an order some little time since to the Dominion Iron and Steel Co. for 15,000 tons steel rails 100 lbs., and for 11,000 tons 80 lbs. The 100 lb. rails were delivered in Dec. and the 80 lb. ones are to be delivered in Jan. and Feb.

ELECTRIC RAILWAYS

Canadian Street Railway Association.

PRESIDENT, James Anderson, General Manager, Sandwich, Windsor and Amherstburg Ry.; VICE PRESIDENT, P. Dubee, Secretary Montreal Tramways Co.; SECRETARY-TREASURER, Acton Burrows, Managing Director, The Railway and Marine World.

ASSOCIATION'S OFFICE, 70 Bond St., Toronto. EXECUTIVE COMMITTEE.—E. P. Coleman, Manager of Railways, Dominion Power and Transmission Co.; H. M. Hopper, General Manager, St. John Ry.; J. E. Hutcheson, Superintendent, Ottawa Electric Ry.; C. B. King, Manager, London St. Ry.; D. McDonald, General Manager, Montreal Tramways Co.; M. N. Todd, President, Galt, Preston and Hespeler St. Ry.

ASSISTANT SECRETARY, Aubrey Acton Burrows, Secretary and Business Manager, The Railway and Marine World.

OFFICIAL ORGAN, THE RAILWAY AND MARINE WORLD.

British Columbia Electric Railway Co's Annual Report.

The report presented at the annual meeting in London, Eng., recently covered the year ended June 30, 1911. Following are extracts:—

Gross receipts increased \$1,323,028 or 43%, and net earnings, including income from investment and subsidiaries, and after charging renewals, increased \$369,521 or 34%.

The following charges were made against the revenue account of the year:—Provision for renewals maintenance, £76,136 0s. 3d. Written off old steam plant, £10,000. Added to capital amortization fund, £2,182 15s. 4d. The net profit for the year, after making the deductions is £281,126 1s. 3d. Add balance brought forward from last year, £5,606 16s. 1d. Total, £286,732 17s. 4d. Out of this balance was paid interest on debentures and debenture stock £82,670 11s. 2d., dividend on 5% cumulative perpetual preference stock £35,000, dividend on preferred ordinary stock £42,000, and 6 months dividend on deferred ordinary stock to Dec. 31, 1910, £32,000, or £191,670 11s. 2d., leaving available for further distribution and reserve £95,062 6s. 2d., out of which the directors recommend payment of a dividend in the deferred ordinary stock of 4% for the half-year ended June 30, making 8% for the year, and absorbing £32,000; transfer to reserve fund £56,472 3s. 6d. and carrying forward to the current year £6,590 2s. 8d.

A large amount of construction work has been carried on during the year, not only in new developments, but in extensions of the existing railway, lighting and power systems. A large terminal station and central offices, necessary to meet the requirements of the business, are in course of construction in Vancouver, and a handsome new station was recently opened in New Westminster.

The growth of the business is indicated by the following figures:—Miles of track in operation—1909, 97.74; 1910, 141.65; 1911, 233.65. Total cars of all classes—1909, 248; 1910, 427; 1911, 647.

The number of passengers carried during the year was 46,541,448, an increase for the year of 12,064,644. A satisfactory feature of the year's business is the growth of the revenue received from the new suburban lines.

During the year great dislocation of traffic and large expense to the company has been caused by the large amount of street paving and improvement that has been undertaken by the cities of Vancouver and Victoria. This has not only adversely affected the company's profit, but has caused much irregularity

in the service and consequently great inconvenience to the public.

Considerable progress has been made with the construction of the dam at Coquitlam, an undertaking which is the largest of its kind in Canada. This dam, when completed, will be 90 ft. high and contain about 554,000 cu. yds. of earth work, and by its means the level of Coquitlam Lake will be raised 60 ft., rendering 54,000 million imperial gallons of water storage available for power purposes. The enlargement of the tunnel between Lake Coquitlam and Lake Buntzen, which has been in progress during the last two years, has been successfully completed. This tunnel, 12,755 ft. long, originally had a cross sectional area of about 81 sq. ft., and has been enlarged to 172 sq. ft., thus increasing its capacity three times. It is now possible to bring up the power at Lake Buntzen to upwards of 70,000 h.p., which will be available to meet the rapid growth of the demand in Vancouver.

There is being installed at the power house a third 10,000 h.p. water wheel, which it is hoped will be ready for operation in Dec., bringing the capacity of the plant there up to 42,000 h.p. Plans are being prepared for a large extension of the power house and the provision of two new 15,000 h.p. turbine units. In addition, the company has in progress an extension of the auxiliary steam plant, which has been provided for temporary breakdowns on the transmission lines, bringing the capacity of the steam plant up to 12,000 h.p.

Plans have now been filed with the Government for the construction of plants for the utilization of the company's water powers at Lillooet and Jones Lake, Chilliwack. The board has a carefully considered scheme for the provision of power to meet the requirements of the company in future years. On Vancouver Island the installation of a water power at Jordan River has been satisfactorily completed, and there should shortly be available a sufficient quantity of power to meet the increasing demands of the city of Victoria, and district.

The company has commenced the construction of a line of about 20 miles from Victoria through the fertile Saanich peninsula, and it is generally expected that this line will considerably augment the growth of the undertaking in Victoria, which, during recent years, has been making rapid strides.

Towards the end of 1910 the directors were asked by the city of Vancouver to consent to a unification of the franchises, under which the company operates its railway business in various parts of the city and suburbs, with a view to facilitating the consolidation of the city and the various separate suburban municipalities which surround it into one great city. The directors consented to enter into an agreement whereby the municipality would have obtained the right to purchase the company's railway lines within the extended limits of the new city in 1934, but in the negotiations that followed, some of the representatives of the city endeavored to introduce restrictions of a general nature to which the directors could not see their way to agree, and, in consequence, no arrangement has been concluded. The company operates its line within the narrow boundaries of the old city under statutory powers and subject to an agreement renewable in 1919 for successive periods of five years, until the city determines to buy the railway property within the old city limits. The price, in the event of dispute, is to be fixed by arbitration. In fixing the pur-

chase price, the arbitrators are to take the then market value of all lands to be taken over, and the value of all improvements, buildings and machinery then made, affixed or erected on the lands, and of the personal property to be taken over, which values shall be arrived at by taking the cost to the company, including the cost of constructing the railway lines and of installing all the plant and machinery, and deducting therefrom a reasonable sum for depreciation. The portion of the company's railway which the city of Vancouver will be entitled to purchase represents 49 miles out of a total of 234 miles operated by the company. Should the city exercise this right the company will retain various lines of entry into the city in perpetuity or for a long period of years. The whole of the remaining lines are operated under franchises extending over periods of not less than 36 years. The company's business has during the last few years developed to such an extent, particularly in the outlying districts, that the receipts from the railway lines within the old city limits are no longer such an important part of the whole receipts of the company as they were, and are steadily becoming a smaller proportion of the whole. The lighting franchises are either perpetual or for a very long period of years.

To prepare for handling a greatly extended and increased volume of business in the future, the directors, after consulting with the General Manager, thought it advisable to engage additional expert assistance, and decided to associate with the management several highly qualified officials to take charge of important departments, now rendered necessary by the magnitude of the business.

The gross receipts for the year were £901,553, net revenue, £302,993; number of passengers, 46,541,448.

The statement of expenditure on appropriations on capital account, amounting in all to \$2,786,529.77, includes the following items:—Rolling stock, \$773,039.59; permanent and double tracking and sundry improvements, \$433,242.09; track extensions, \$365,107.87; power extensions, \$142,378.26; steam plant, \$148,360.00; lands and buildings, \$348,727.57; electrical machinery, \$119,457.18. North Vancouver: Rolling stock, meters, transformers and initial installations, \$38,181.79; railway feeders, \$14,804.14.

Re-winding Coils at Levis County Railway Shops.

A very economical and satisfactory method of utilizing old field coils is used by the Levis County Ry., of which A. K. McCarthy is Manager. The customary practice with old, blown-out coils is to scrap them at the prevalent scrap copper rate of about 10 cts. a pound. This practice was followed by the company until early last year, when the more economical method to be described in this article was devised and put into operation at its shops.

The old coil, discarded for various reasons, the principal ones being blow-outs, is attached to a circular plate mounted on a shaft running in bearings. The insulated wire led off from this, is passed through a little device for keeping the wire taut. This device consists of two old trolley wheels permanently fixed on bearings, with an intermediate wheel adjustable vertically to the line joining the centres of the two fixed wheels. Adjusting puts a bend in the wire of the necessary depth to hold it

taut. A receiving reel is mounted on an iron trestle. Directly attached to the reel shaft there is a large gear meshing, with a pinion on a shaft through the trestle and connected to a handle for drawing the wire into the reel.

The taut wire between tightening attachment and receiving reel is scraped clean of insulation by an operator, another operator at the handle drawing the wire through as required. This operation is performed very quickly.

When the wire is completely cleaned, the containing reel is placed in the position of the reel containing the old wire. The wire, passed through the tightening device, is fed on to a coil form on the receiving arbor shaft. Between the tightening device and receiving form an operator tapes the wire, another operator feeding it on with the handle, as before. A coil as good as the original one is thus obtained at small cost.

Figures obtained from Mr. McCarthy show that big savings result. A coil costing \$20 to replace may be wound complete at a total cost of \$7.50. Considering that the coil if scrapped would sell for \$2 at 10 cts. a pound, a total saving of \$10.50 is obtained, or more than 50% on the cost price. On a road such as the Levis County Ry., the lines of which are very hilly, blow-outs, especially in the springtime, are quite frequent, which under the old system necessitated discarding the whole coil. It

lowering of the side ploughs, while the control wheels towards each end are for the raising and lowering of the sweeper brooms in their curved ways.

There are two traction motors of the Westinghouse 101 B 2 type to each truck, in the usual location under the car. The broom motors, one in each compartment at the ends of the control compartment, and offset as indicated, are Westinghouse 12A. The Westinghouse SM1 air compressor is housed in one of the broom motor compartments. The trucks are of the 27-FE-1 type, and the controllers of the K35 type.

The design is entirely new throughout, the frame and superstructure being constructed entirely of steel. This makes a heavy construction, much heavier than strength would demand, but for sweeper service, heavy weight is necessary to keep the machine up to its work. It is calculated to be able to do this satisfactorily.

The sweeper is being built by the Ottawa Car Co. and was designed by its Superintendent, W. K. Jeffrey.

Guelph Radial Railway Co.'s Annual Meeting.

The report for the year ended Sept. 30, 1911, shows a net gain of \$7,749.83, after deducting a maintenance charge of \$7,300. The earnings show an increase of \$3,815.15 over those of the previous year.

All Steel Sweeper for Ottawa Electric Railway.

is estimated that upwards of \$300 was saved last spring alone by the use of this method.

While wage accounts for the road have been materially increased recently, the introduction of a couple of such economical schemes has kept the total expense account nearly constant.

All Steel Sweeper for Ottawa Electric Railway.

An all steel electric sweeper is being built for the Ottawa Electric Ry., three views of which are given in the accompanying illustration. In general appearance, the sweeper closely resembles an electric locomotive of the usual type, having the central cab with the sloping end compartments.

The centrality of control will be noted in particular, all control levers and wheels being within easy reach within the central cab. The centre controlling wheel in the plan is for the raising and

The number of passengers carried during the year was 820,836, an increase of 151,884 over the previous year, and the number of transfers issued was 69,497. Following are details of the balance sheet and profit and loss account:—

The Dominion Power and Transmission Co. has ordered three interurban cars, 55 ft. long over all, mounted on Baldwin trucks, with steel tired wheels, equipped with Westinghouse straight air brakes, turtle roofs and Garland ventilators; and three double truck city cars, standard type, from the Preston Car and Coach Co., Preston, Ont.

Electric Railway Projects, Construction, Betterments, Etc.

Alberta Electric Ry.—The Land Traction Co. was incorporated under the Companies Ordinance no. 1417 of the province of Alberta, Sept. 15, with a capital of \$500,000 in two classes of shares, and office at Calgary, with power to enter into agreements for the construction of railways of all kinds, and particularly for the financing and construction of the Alberta Electric Ry. The directors are: Dr. T. H. Blow, G. E. Wood, W. A. Lowry, C. S. Drummond, S. E. Beveridge, John Breckenridge, all of Calgary. C. S. Drummond, the Managing Director, was formerly a director of the British Electric Traction Co., London, Eng., and J. Breckenridge is described as a railway contractor. The secretary of the company is S. C. McGregor. The company has acquired all the charter rights of the A.E. Ry., paying in respect of the same 10,000 B shares of \$25 each, which are to rank for dividend at the rate of 6% after a 5% dividend has been declared on the 10,000 A shares. The company offered for subscription, the list closing Nov. 11, the A shares and 900 bonds of \$500 each bearing 5% interest, redeemable in 30 years by means of a sinking fund of 2% per annum. The proceeds of the issue will, the prospectus stated, be applied to the building of the first section of the company's lines. The A.E. Ry. is authorized to issue shares to the value of \$10,000,000 and bonds to the amount of \$36,000,000. No lines are to be built until the routes have been approved by the Lieut.-Governor-in-Council. In preparation for making the application for this approval municipalities are being asked to grant rights for the building of the lines along public highways, and farmers are being asked to give free right of way where it is not convenient to have the line on the highway. Application is being made for a Government guarantee of the interest on the construction bonds as the lines are built. (Nov., pg. 1067.)

Bassano, Alta.—Press reports state that the Gorman, Clancy and Grindley Co., Calgary, Alta., have been given a contract for the building of five miles of an electric railway from Bassano to the C.P.R. irrigation dam.

Another report states that a franchise has been granted for the building of an interurban electric railway, by the Bassano council, and that eight miles of the line are to be in operation within 90 days after the passing of the bylaw.

Berlin and Bridgeport Electric St. Ry. We are advised that the project for the building of a belt line referred to in our last issue, is not in connection with the B. and B.E. St. Ry., but with the Berlin and Waterloo St. Ry., which is owned by the Berlin town council and operated by commissioners. The project has been under discussion for some time, but no definite progress has been made.

Application is being made to the Ontario Legislature for an act changing the name of B. and B.E.S.R. Co. to the Berlin and Northern Electric Ry. Co., increasing the capital stock to \$400,000, declaring that all existing municipal by-laws relating to the company shall continue in force, and authorizing the building of a line from Bridgeport to Elora and Fergus, Ont.; erecting bridges across the Grand River and its branches as may be necessary; authorizing the company to carry freight over its lines, and giving power to amalgamate with other companies, etc. (Dec., 1911, pg. 1171.)

Brandon, Man.—As the result of the recent vote in the city of Brandon, favoring the operation of a street car system by private ownership, negotia-

tions were reopened with J. D. McGregor, Dec. 1. He has submitted a draft agreement, which is under consideration by the council's railway committee. Another proposal has been submitted by Donham and Co., New York, covering in addition to a street railway franchise, the supply of water, light, heat and power. (Dec., 1911, pg. 1171.)

British Columbia Electric Ry.—The Vancouver city council is applying to the B.C. Legislature for amendments to the Vancouver Incorporation Act of 1900 by providing, among other things, that \$503,000 a year shall be set aside from 1912 to 1919, inclusive, out of the city's borrowing powers for the purpose of acquiring the company's lines in the city under the terms of clause 34 of the agreement of Oct. 14, 1901. If the lines are not acquired the franchises are not to be extended until a new agreement has been voted on by the ratepayers.

Judgment has been reserved by the Court of Appeal upon the question of the validity of the company's franchise in Point Grey. The company is not directly a party to the action which was brought by certain ratepayers against the council.

The Burnaby municipal council has decided to proceed with an action to test the validity of the company's franchise. (Dec., 1911, pg. 1171.)

Calgary Municipal Ry.—The Calgary, Alta., city council has accepted tenders for the supply of ties, poles, rails and other materials for extension of its lines to be built during 1912. The Board of Railway Commissioners has authorized the city to carry its tracks across the C.P.R. at 12th Ave., near 6th St. (Dec., 1911, pg. 1171.)

Cape Breton Electric Co.—A. S. Pratt, representing Stone and Webster, Boston, Mass., who manage this company, recently made an inspection of the company's lines, etc., at Sydney, N.S., and is reported to have said that \$125,000 had been expended upon improvements to the various properties during 1911. (May, 1911, pg. 453.)

Chatham, Wallaceburg and Lake Erie Ry.—We are advised that the company has under consideration the construction of the following additional lines:—Cedar Springs to Blenheim, Ont., 4.5 miles, and a spur line in Chatham, 1.25 miles. (June, 1911, pg. 555.)

Chestermere and Calgary Suburban Ry.—Construction is being proceeded with on this line, under an agreement with the city of Calgary, Alta. The starting point is not Crescent Heights, as a press report referred to in our last issue stated, but a point inside the city limits of Calgary, and connecting with the city lines. The line from Calgary to Chestermere Lake will be about 17 miles, and is being built by day labor by the company. We are advised that all the heavy grading has been done, and that the pole line has been completed. It is expected to have track laid by April 30, and to have the cars running shortly thereafter.

Application is being made to the Alberta Legislature for an act amending the company's charter in some details, and extending the time within which the lines may be built. (See Calgary to Chestermere, Alta., Dec., 1911, pg. 1171, and C. and C. St. Ry.)

Edmonton Interurban Ry.—The Alberta Legislature is being asked to amend chap. 49 of the statutes of the second session of 1910, by extending the time for the building of the line from the foot of Perron St. in St. Albert, to the boundary of the city of Edmonton. Bishop, Pratt and Delavault, Edmonton, are the solicitors.

Edmonton Radial Ry. - Strathcona Radial Ry.—The estimates under consideration for the extension of lines, im-

provements, additional rolling stock, etc., in Edmonton, Alta., for the current year, amount to \$596,000, distributed as follows:—Extensions of tracks, \$213,700; track improvement, \$107,000; new car barns, \$125,000; rotary converters, \$30,000; fifteen new cars, \$112,000, the balance being set aside for miscellaneous purposes. (Dec., 1911, pg. 1171.)

Galt, Preston and Hespeler St. Ry.—Press reports state that the town council of Galt, Ont., has granted the necessary privileges for a single line extension, with necessary switches and turnout, to serve the new industrial subdivision beyond the water works. (Jan., 1911, pg. 71.)

Greenwood-Phoenix Tramway Co.—It is reported that considerable progress has been made with the boring of the tunnel between Greenwood and Phoenix, B.C., via the Boundary Creek Valley. The distance between the two points is 17,000 ft., and the hill rises above the tunnel at Phoenix to a height of 2,000 ft. The size of the bore is 9 by 8 ft., in which is to be laid a tramway line to be operated by electricity. Up to Nov. 30 it was reported that 3,000 ft. had been bored, and that work was being pushed forward at the rate of 10 ft. a day. The city of Greenwood has voted \$50,000 towards the project. (June, 1911, pg. 555.)

Guelph Radial Ry.—An extension of the line from the centre of the city of Guelph, Ont., easterly for 1.25 miles has been completed, and we were advised, Dec. 7, that cars would be put in operation over it within a few days thereafter. (July, 1911, pg. 683.)

Hull Electric Co.—The company has under consideration a project for the extension of the line from mileage 6.25 for 3,100 ft. to the Ottawa Racing Association's track. (Nov., 1911, pg. 1069.)

Hamilton, Waterloo and Guelph Ry.—In addition to the extension of time already applied for, the company is applying to the Dominion Parliament for authority to increase its capital to \$9,000,000. (Dec., 1911, pg. 1171.)

Lethbridge, Alta.—The taxpayers carried a bylaw, Dec. 11, authorizing the council to raise \$450,000 by debentures for the building of an electric railway in the town. (Dec., 1911, pg. 1171.)

Levis County Ry.—During 1911 the company extended its upper town line two-thirds of a mile. (Dec., 1910, pg. 1069.)

London Street Ry.—The London, Ont., city council is considering the question of what additional mileage it is enabled to have laid under the franchise, on the basis of the present population. It is estimated that the city is entitled to between two and three miles of line. The matter is being discussed with C. B. King, the company's Manager, who told the council at its last meeting that three propositions were under consideration, and that plans would be submitted early in the year. (Dec., 1911, pg. 1711.)

Moncton Tramways, Electricity and Gas Co.—The first cars were run over the newly constructed street railway in Moncton, N.B., Nov. 30, and a regular service was put in operation Dec. 13. This is the second street car line put in operation in the city, the first having been inaugurated in 1896. After a checkered career it was abandoned and the rails taken up in 1902. (Dec., 1911, pg. 1171.)

Montreal.—The city council has under consideration a recommendation from the board of control that application be made to the Quebec Legislature for authority to build an underground electric railway system in the city.

Montreal and Southern Counties Ry.—During 1911 the company completed an extension of its tracks from St. Lam-

bert, Que., to the Country Club, 1.25 miles. It has under construction an extension from St. Lambert to Chambly, 14 miles. In addition to this St. Lambert-Chambly line, the company has on its programme, according to statements reported to have been made in an interview by W. B. Powell, General Manager, Dec. 1, several additional lines. One of these will start from Longueuil and will extend through Boucherville to St. Charles, Que., and a branch from St. Lambert to Laprairie. In connection with the first mentioned of these two lines, the land owners in the Boucherville district passed a resolution at a public meeting to give a right-of-way 40 ft. wide, on condition that the company maintain the fences and gates along it. The question of the electrification of the Montreal and Province Line, and its operation as part of the M. and S.C. Ry. is reported to be under consideration.

Press reports further state that plans for the erection of a car barn 205 by 35 ft., an additional power house, workshops and offices are under consideration.

Petitions were presented to the Montreal city council, Nov. 30, in favor of permission being given the company to build additional lines in the city. The controllers desire the company to try and make some arrangement with the Montreal Tramways Co. (Dec., 1911, pg. 1171.)

Montreal Tramways Co.—E. A. Robert, President, is reported as having stated, Dec. 2, that the company would be prepared to lay its plans for extensions and general improvements before the city council at an early date.

The town of Montreal West is applying to the Quebec Legislature for authority to execute a contract with the Montreal Park and Island Ry. Co., its representatives and assigns, and to approve a bylaw naming the Montreal Tramways Co. in the contract in place of the M.P. and I Ry. (See Montreal St. Ry., Oct., 1911, pg. 975.)

Niagara, Welland and Lake Erie Ry.—The Board of Railway Commissioners has authorized the company to carry its line across the G.T.R. spur track on Muir St., Welland, Ont. (June, 1911, pg. 557.)

North Midland Ry.—A bylaw granting the company a bonus of \$25,000, and providing for raising the same by debentures will be submitted to the London, Ont., taxpayers Jan. 1. The bylaw also provides for a right to run cars along certain streets in the city. At the voting in Jan., 1911, a bylaw authorizing the city to guarantee the company's bonds to the amount of \$1,200,000 was passed, provided a suitable agreement was arranged, but it was found to be impossible to arrange terms, and the new bylaw is proposed as a substitute. A suggestion has been made for the erection of a terminal station to be used by all electric railways entering the city, and the council is considering the advisability of building this as a municipal enterprise.

The company proposes first to build a line from London via St. Marys to Stratford. A bylaw granting a bonus of \$5,000 will be voted on Jan. 1, in St. Marys, and Stratford is being asked for a bonus of \$15,000. A. E. Welch, in asking for this latter bonus, told the Stratford council that he had been instructed by the British interests behind the company to obtain all the franchises necessary so that construction might be started at an early date. (Dec., 1911, pg. 1171.)

Oshawa Electric Ry.—During 1911 the company rebuilt 3,800 ft. of track, the work being necessitated by the laying of new pavements by the town. The old steel was re-laid, but new switches, new

ties and other new fixtures were used. In addition there have been added 809 ft. of new spurs to industrial concerns. (July, 1911, pg. 683.)

Ottawa Electric Ry.—We are advised that the company has under consideration a project for building an extension from the Bank St. terminus to Ottawa South, one mile.

We are officially advised that the O.E. Ry. is not interested in the proposal to build an electric railway from Ottawa to McGregor Lake. It is said that the promoters are E. Wellingsford and Dr. Corno, Ottawa, but that while plans have been outlined, the whole proposal, including the laying out of a summer resort at McGregor Lake, is still under consideration. (Dec., 1911, pg. 1173.)

Ottawa, Smith's Falls and Kingston Ry.—The prospectus filed with the Provincial Secretary, Toronto, sets out that the company was incorporated by the Ontario Legislature Mar. 8, 1911, with a capital of \$1,000,000 and office at Ottawa. The provisional officers and directors are:—Chairman, F. A. Heney, Ottawa; Vice Chairman, E. Kidd, M.P., North Gower, Ont.; Secretary-Treasurer, G. L. Dickenson, Manotick, Ont.; General Manager, U. L. Upson, Ottawa. Other directors—N. P. McGrath, Ottawa; Rev. D'A. T. Clayton, J. C. Graham, Kars, Ont.; J. E. Caldwell, City View, Ont.; J. C. Graham, Kingston, Ont.; Solicitor, F. B. Proctor, Ont. It is intended, according to the prospectus, to start construction as soon as 2,500 shares of the capital stock have been disposed of and 10% thereof paid up.

The plans show a line from Ottawa passing through or near City View, Manotick, Kars, Bridge View, Burritt's Rapids, Andrews, Merrickville, Kilmarnock, Smiths Falls, Lombardy, Newboyn, Portland, Elgin, Morton, Seelys Bay, Brewers Mills, Washburn, Joyceville, Cashendall, and Kingston Mills to Kingston. An alternative route has been surveyed from Seelys Bay to Kingston Mills, passing through or near Heeleysville, Sunbury, Mount Cheshire and Maple Lawn. A branch line has also been surveyed from Smiths Falls passing through Perth to Lanark. The construction programme outlined divides the main line into two sections—Ottawa to Smiths Falls, 47 miles, and Smiths Falls to Kingston, about 60 miles. The surveys for the section from Ottawa to Smiths Falls have been completed, and those from Smiths Falls to Kingston have been partially made.

The population to be served on the Ottawa-Smiths Falls section is placed at 106,800, and the estimated cost of construction at \$430,000, or, with the addition of \$21,000 for supervision, engineering and legal expenses, and \$18,000 for two 50-ton locomotives, three freight cars, two combination cars and two coaches, \$469,500. The estimated revenue from this section is placed at \$160,000 and the operating expenses at \$96,096, leaving a surplus of \$64,064 for interest, dividends, etc. The company is authorized to issue bonds for \$30,000 a mile of line constructed. The estimated cost of the Smiths Falls-Kingston section, subject to revision on completion of surveys, is placed at \$934,500, including supervision, etc. No estimate of earnings for this section has been made. (Nov., 1911, pg. 1069.)

Porcupine and Belt Electric Ry.—The Ontario Legislature is being asked to incorporate a company with this title to build an electric railway from the eastern boundary of the province in McGarry tp. southerly to Larder City, westerly to Dane tp., and crossing the Temiskaming and Northern Ontario Ry. westerly to Kenogamissee Lake on the Mattagami River, with branch lines as necessary, any or all of which may be connected with the T. and N.O. Ry. or other railways serving the district.

While it is intended to operate the line by electricity, authority is asked to use any other motive power. Corley, Price and Garvey, Toronto, are solicitors for applicants.

Quebec Ry., Light and Power Co.—The Montmorency division has a double track from Quebec to Montmorency Falls, and we are officially advised in connection with the reports that a second track is to be laid at Ste. Anne de Beaupre, that this will depend very largely on what business is offering after the completion of the Quebec and Saguenay Ry., which is under construction from near St. Joachim, on the Montmorency Division, to Murray Bay.

A new double-track line from Beauport to Kent House Park, 3.58 miles, was completed and put in operation during 1911. The work was done by M. Lonerger, Quebec. (Dec., 1911, pg. 1173.)

Regina Municipal Ry.—The work for 1911 was completed Nov. 30, with the opening of the South Railway St. and Lorne St. sections. There are seven miles of line in the city, the first portion of this mileage having been placed in operation July 29.

The construction for 1911 included the laying of 35,280 ft. of 80 lb. steel, with the necessary paving, and 21,000 ft. of 76 lb. steel on unpaved streets, which distance was ballasted. This is practically 10.66 miles of line. The extensions projected for construction during the current year include 2.5 miles of single track on paved streets, and 15.5 miles of single track on unpaved streets. On the paved streets 80 lb. steel will be used, and on the unpaved streets 60 lb. steel.

Ridgeway to Crystal Beach.—Press reports state that arrangements are being made for the building of an electric railway from Ridgeway to Crystal Beach, on Lake Erie, Ont., and that already \$12,000 has been subscribed. G. Pettit, E. W. Near and W. G. Athol are reported to be interested in the project.

St. Thomas Street Ry.—A bylaw will be submitted to the taxpayers, Jan. 1, to authorize the city council to extend the municipal electric railway from St. Thomas to Port Stanley, Ont. The city engineer was instructed to provide estimates as to the cost, so that, if the project is favored, a bylaw may be prepared authorizing the raising of the money not only for building the new line, but for improving the existing line. (May, 1911, pg. 455.)

Saskatoon Electric Ry. and Power Co.—Application is being made to the Saskatchewan Legislature to incorporate a company with this title to build an electric railway within the city and within a distance of 25 miles from the city boundaries, and for the purpose of acquiring H. M. E. Evans' rights in a contract for the building of such a railway, etc. Short, Woods, Biggar and Collisson, Edmonton, Alta., are solicitors for applicants. (See Saskatchewan Power Co., Dec., 1911, pg. 1173.)

Sherbrooke Ry. and Power Co.—Application is being made to the Quebec Legislature to extend the area within which the company may carry on its operations, to confirm certain agreements, and to authorize it to carry on the additional business of a water company, gas company, etc. (Nov., 1911, pg. 1069.)

Sudbury-Copper Cliff, Ont.—A press report states that a franchise has been granted to L. La Forest for the building of an electric railway from Sudbury to Copper Cliff, Ont.

The Sudbury, Copper Cliff and Creighton Electric Ry. Co. was incorporated by the Ontario Legislature in 1903 to build a line between these and adjacent points.

Three Rivers, Que.—Press reports state that it is proposed to start construction upon the projected electric railway in that municipality early in the spring. Construction will be started within the city limits, and the radial lines will be built subsequently. About 5.5 miles of line are to be built by the city council under the authority of the bylaw recently passed. (Nov., 1911, pg. 1071.)

Toronto and York Radial Ry.—While no additional mileage was added during 1911, about half a mile of a double track line was built on a private right-of-way on the Mimico Division, in the vicinity of Mimico Creek, the track along the Lake Shore road being abandoned. (Dec., 1911, pg. 1173.)

Toronto Civic Car Lines.—We are officially advised that the work on the car lines proposed to be built by the city of Toronto up to the present has been of a preliminary character, including some grading. It is not intended to push construction actively until the spring.

The City Engineer laid before the board of control recently a complete plan and report upon a system of subway and surface electric railways prepared by E. L. Cousins, Assistant Engineer in charge of railway and bridge work. The Teraulay-Yonge St. subway, which is to be voted on Jan. 1, is the central feature of the plan, but as outlined the completed proposal provides for the building of a subway from Keele St., on the Lake Shore road, to the Woodbine, along Queen St., another from Keele St., along Bloor St. to Shearwater St. to meet an extension of the city car line now under construction on Danforth Ave., with surface car lines connecting the subways along Keele St., Pape Ave., and Coxwell Ave. This latter line would be connected with the Gerrard St. line now under construction. Provision is also made for future extensions in the east along Woodbine Ave. to St. Clair Ave.; on Leslie St., and on Don Mills Road; and on the west along St. Clair Ave. to Jane St., down Jane St. to Bloor St., and along Bloor St. to a junction with the subway. A line from Bloor St. to St. Clair Ave. is planned along Runnymede Ave., and another is proposed from Jane St. to Keele St., along Annette St., while the Keele St. line is to be extended from Bloor St. to St. Clair Ave. The estimated cost for the construction of the whole of these lines is \$25,000,000, including equipment. (Dec., 1911, pg. 1165.)

Winnipeg Electric Ry.—The total mileage of new track laid during 1911, exclusive of second track and sidings, was 10.75 miles, distributed as follows: Donald and Princess Streets to Marion St., Ellen and Sargent avenues to Sutherland Ave., Pembina St. to Sherbrooke St. subway, Stafford St. to Arlington St., Hespeler Ave. to Louise Bridge, McPhillips St. to Kennedy St., Selkirk Ave. to Garry St., and on Higgins Ave.

The rural municipality of Assiniboia is negotiating with the company respecting the erection of a bridge over the Assiniboine River west of the park, while the municipalities of St. Boniface and St. Vital are negotiating with the company for the building of a line along St. Marys road into the open country beyond the boundaries.

Uno-rail System.—A company with this title has been incorporated under the Dominion Companies Act, with a capital of \$100,000 and office in Montreal, to build and operate uno-rail systems, to manufacture and sell cars and all other appliances necessary therefor, and other incidental purposes. The provisional directors are: J. Moller, D. J. Stewart, B. J. Forest, J. B. Johnson, Montreal; J. E. Conlin, Outremont, Que.

The Ontario Railway and Municipal Board and the Toronto Railway.

The Ontario Railway and Municipal Board issued an order recently directed to the Toronto Ry. Co., as follows:—

That the company issue proper and sufficient transfers to enable all passengers to reach their destination by a continuous journey, although cars of a different route may operate over part of the said journey; and that such passengers shall be entitled to perform part of their journey upon the cars of any line operating along the course of such journey; and such passengers shall, upon payment of a fare, be entitled to a transfer from the cars of any such route to any other cars.

That the company operate until further order the full service upon Dundas St. to the end of the line at Keele St., and are hereby prohibited from using any of its cars at any point short of the end of the route.

That the company operate until further order, its cars upon the Queen St. line over the Roncesvalles Ave. line as far as Boustead Ave., where such cars may be y-ed and return.

Electric Railway Finance, Meetings, Etc.

Berlin and Bridgeport Electric Ry.—We are advised that a proposition is under consideration by the Commissioners of the Berlin and Waterloo Electric Ry. for the purchase of the B. and B.E. Ry.

It is reported that W. E. Breithaupt, President, has offered to sell the B. and B.E. Ry. to the Berlin council for \$44,000.

Berlin and Waterloo Street Railway.—The commissioners operating the lighting plant and street railway for the town have decided to hand over to the town profits sufficient to reduce the tax rate by a mill. The commissioners propose to pay over to the town about \$1,400 out of the profits of operation of the street railway during 1911, providing the ratepayers carry a bylaw to raise \$7,400 to defray the cost of improving the roadbed last year. During 1911 the B. and W.St. carried 194,814 passengers, an increase of 8,122 over 1910. The total receipts for the year were \$38,999.07. After paying operating expenses, maintenance and repairs and general expenses, including debenture principal and interest, a balance of \$190.11 was reported.

British Columbia Electric Ry.—Gross earnings for Oct., 1911, \$490,451; working expenses, \$303,511; net operating earnings, \$186,940; renewal funds, \$37,936; net earnings, \$149,004; approximate income from investments, \$25,000; net income, \$174,004, against \$349,664 gross earnings; \$205,266 working expenses; \$144,398 net operating earnings; \$25,411 renewal funds; \$118,981 net earnings; \$20,000 approximate income from investments; \$138,981 net income for Oct., 1910. Aggregate gross earnings for four months ended Oct. 31, 1911, \$1,789,692; net earnings, \$615,142, against \$1,247,122 gross and \$531,577 net for same period 1910.

The Guelph Radial Ry. has declared a dividend of 4½% on its \$126,000 of stock, which is held by the city of Guelph, Ont.

Halifax Electric Tramway.—Receipts for Nov., \$17,036.85, and for two weeks ended Dec. 14, 1911, \$8,033.32, against \$15,992.85 and \$7,176.41 for same periods 1910.

Montreal St. Ry.—Passenger earnings for Nov., 1911, \$409,396.52; miscellaneous earnings, \$11,079.90; total earnings,

\$420,476.42; operating expenses, \$260,576.06; net earnings, \$159,900.36; city percentage on earnings, \$14,372.90; interest on bonds and loans, \$15,338; rental leased lines, \$607.10; taxes, \$5,000; total charges, \$35,318; surplus, \$124,582.36; expenses per cent. of earnings, 61.97, against \$355,586 passenger earnings; \$10,512.34 miscellaneous earnings; \$366,098.34 total earnings; \$227,441.90 operating expenses; \$138,656.44 net earnings; \$11,692.01 city percentage on earnings; \$15,768.22 interest on bonds and loans; \$552.90 rental leased lines; \$4,000 taxes; \$32,013.13 total charges; \$106,643.31 surplus; 62.13 expenses per cent. of earnings for Nov., 1910. Aggregate total earnings for two months ended Nov. 30, 1911, \$862,869.17; operating expenses, \$492,777.96; net earnings, \$370,091.21; total charges, \$71,014.72; surplus, \$299,076.49; expenses per cent. of earnings, 57.11, against \$752,786 aggregate total earnings; \$433,191.96 operating expenses; \$319,594.04 net earnings; \$64,011.14 total charges; \$225,582.90 surplus; 57.55 expenses per cent. of earnings for same period 1910.

Montreal Tramways Co.—The President is reported as having stated, Dec. 6 that over 85,000 shares out of 100,000 of the Montreal Street Ry. Co. had been exchanged for M.T. Co.'s stock under the reorganization plan.

Nelson St. Ry.—A meeting of shareholders was held at Nelson, B.C., Nov. 25. The financial statement was considered satisfactory. The average receipts per month to Oct. 31 were said to have been \$1,231.94, and the average expenses per month, \$786.34; the net revenue representing 9% upon the capital invested. It is proposed to raise an additional \$12,000 of capital to further improve the line.

Regina Municipal Ry.—Under sec. 6 of the City Act, the city council of Regina closes its financial year, Oct. 31, and the City Treasurer has issued his statement for the ten months ended on that date, including the street railway accounts. The receipts for the period the lines have been in operation were \$14,065.78, of which \$13,805.78 was from passenger traffic and \$260 from advertising. The current expenditure amounted to \$9,690.62, leaving a net revenue of \$4,375.16. The capital expenditure to Oct. 31 was \$455,271.28.

The City Engineer reports that track has been laid on 7.5 miles of street, and regular service is given by six cars. "The results of operation to date have been the payment of all operation charges, interest on the amount invested and a credit to partly cover the sinking fund. The carrying charges and overhead expenses for so small a number of cars running are high and it is considered that by the purchase of a few more cars the net revenue will be increased and an allowance be available for depreciation. An order for six additional cars has been placed to be delivered throughout the winter and spring. Provision has been made in the \$400,000 bylaw whereby any deficit will be met out of the proceeds of city property, but the operation to the present has shown that no great contribution at any time will have to be made from this source, but that the system will be self-supporting."

St. Thomas Street Ry.—A statement was submitted to the city council, Dec. 1, showing the result of the operation of the railway for the eight months ended Nov. 30, during which Alderman Price, chairman of no. 5 committee, has been acting as manager. The statement showed that 341,868 passengers were carried, and that the total receipts were \$12,333.42, in comparison with 279,540 passengers and \$12,118.33 of receipts for the corresponding period in 1910. The cost of operation was \$13,023.73 against \$11,990.52 in the same period of 1910.

Toronto Ry.—Gross earnings for Nov., 1911, \$413,525.44; expenses, \$211,919.18; net earnings, \$201,606.26, against \$365,466.21 gross earnings; \$192,103.82 expenses; \$173,362.39 net earnings for Nov., 1910. Aggregate gross earnings for 11 months ended Nov. 30, 1911, \$4,350,064.62; expenses, \$2,183,021.17; net earnings, \$2,167,043.45, against \$3,941,125.10 aggregate gross earnings; \$2,033,438.42 expenses; \$1,907,686.67 net earnings for same period 1910.

Winnipeg Electric Ry.—Gross earnings for Oct., 1911, \$328,386; expenses, \$158,272; net earnings, \$170,114, against \$304,114 gross earnings; \$151,782 expenses; \$152,332 net earnings for Oct., 1910. Aggregate gross earnings for 10 months ended Oct. 31, 1911, \$3,154,023; net earnings, \$1,603,622, against \$2,602,499 gross and \$1,296,958 net for same period 1910.

Electric Railway Notes.

The Edmonton Radial Ry. has adopted a system of electric signs for its street cars.

The British Columbia Electric Ry. has received one heavy double broom snow sweeper from the Ottawa Car Co.

The Regina Municipal Ry. has received an electric snow sweeper from the Preston Car and Coach Co., Preston, Ont.

The Quebec Ry. Light and Power Co. has been fined at the Recorder's Court for illegally operating freight cars on the city streets.

Jas. Hilton has been appointed Traffic Superintendent, British Columbia Electric Ry., at Vancouver, vice J. B. Rannie, resigned.

The Winnipeg city council has under consideration a bylaw providing for the operation of an all-night car service on the Winnipeg Electric Ry.

The Regina Municipal Ry. has ordered six single truck cars, similar to those recently supplied to the Calgary Municipal Ry., from the Preston Car and Coach Co., Preston, Ont.

A contract for advertising in the Edmonton Radial Ry. cars has been awarded by the city commissioners to John Dewar of Edmonton, Alta.

G. W. Seguin, who died at Ottawa Dec. 6, was cashier of the Ottawa Electric Ry. from 1891 to 1896, when he entered the Hull Electric Co.'s service.

The Toronto and York Radial Ry. has received three double truck, double ended pay-as-you-enter car bodies from the Preston Car and Coach Co., Preston, Ont.

The Winnipeg Electric Ry. does not propose, says Manager Phillips, to retire from the lighting business. "No such move," he adds, "has ever been considered by the officials."

The London and Lake Erie Ry. and Transportation Co. is negotiating with the Hydro-Electric Power Commission for current to operate its line from London to Port Stanley, Ont.

The Montreal St. Ry. Mutual Benefit Association is applying to the Quebec Legislature for authority to change its name, and for additional powers concerning the administration of its affairs.

G. B. Hughes, heretofore Engineer of Surveys for Canadian Northern Pacific Ry. lines on Vancouver Island, Victoria, B.C., has been appointed Engineer of Construction, British Columbia Electric Ry.

The Moose Jaw Electric Ry. has received a heavy double broom sweeper, and two 21 ft. pay-as-you-enter car bodies, mounted on 21-E trucks, 31½ ft. long over all, from the Ottawa Car Co.

The Montreal Tramways Co.'s officers for the current year, as elected recently, are: President, E. A. Robert; Vice President, J. W. McConnell; General Manager, D. McDonald; Secretary, P. Dubee.

N. C. Pilcher, whose portrait appears on this page, was appointed Manager, Sherbrooke Ry. and Power Co., Sherbrooke, Que., Sept. 1, 1910, prior to which he was for some time Manager, Port Arthur and Fort William Electric Ry.

The city of Toronto is making application to the Ontario Railway and Municipal Board to compel the Toronto Ry. to put an additional 200 cars into service, and to run all cars to the ends of the respective lines on which they operate.

The Calgary Municipal Ry., in addition to the 12 cars and one sprinkler, which it has on order with the Preston Car and Coach Co., Preston, Ont., as mentioned in our Nov., 1911, issue, has ordered, from the same company, one scenic car.

The British Columbia Electric Ry. has received from the Baldwin Locomotive

P247 N. C. Pilcher,
Manager, Sherbrooke Railway and Power Co.

otive Works a freight locomotive, to be used mainly for emergency purposes. It will probably be used as well for hauling heavy loads of logs from the Fraser Valley line.

N. R. Bugg, who was associated with the promotion of the Peoples Ry., was arrested at Berlin, Ont., on a charge arising out of subscriptions to the stock of the company on allegations made by J. Irvine, Feversham, Ont. He was committed for trial to the county court at Owen Sound, Ont., and was admitted to bail.

The Middlesex, Ont., county council passed a resolution Dec. 10, protesting against the granting of charters for the building of radial railways to irresponsible parties, and asking the Dominion Parliament and the Provincial Legislature not to grant any further charters unless the applicants have given sufficient guarantees of good faith and financial responsibility.

H. M. Graham, who appeared recently at Lindsay, Ont., representing himself as an engineer making surveys for a branch of the Toronto Eastern Ry.

from Port Hope to Orillia, Ont., was arrested Nov. 27 on charges of fraud, and was subsequently sentenced by the police magistrate to three years imprisonment. Toronto Eastern Ry. officials informed the police that Graham was not in the company's employ, and that the company had nothing to do with the project he outlined. Graham admitted he was out to make money by accepting sums from landholders to change the route, which he would locate through farmyards and buildings. His liabilities are said to be over \$1,000, including wages, money borrowed and board bills.

The London and Lake Erie Ry. and Transportation Co. has ordered in the United States, two electric cars, equipped with four motors and Baldwin trucks, and also two trailer cars of the same style. They are designed to be as nearly open cars as practicable, the interior panel finish being eliminated, the upright posts and the carlines in the ceiling being exposed. They are to have the new style turtle-back roof and square cornered sash instead of round and elliptic. Increased floor space is provided by omitting the panel work under the window sills, thus allowing the seats to be placed several inches nearer the side, and leaving a wider aisle. They will be equipped with Westinghouse automatic car and air couplers, and are intended specially for excursions between London and Port Stanley on busy days.

An Electric Railway Official's Family Slandered.

Vancouver, B.C., daily papers of Dec. 1, contained the following:—

During the past two months stories have been circulated concerning the family of R. H. Sperling, General Manager of the B.C. Electric Ry. Co., which were slanderous in the extreme. Despite the fact that the story was a barefaced falsehood, its details being such as to cause any person acquainted with Mr. Sperling or his family to promptly deny the tale without further reference, it has been given wide circulation from mouth to mouth.

While friends and acquaintances of Mr. Sperling have steadily denied the story, the manner in which it has been continually circulated has caused him considerable annoyance, although he has daily been at his office and directing the work of his company during the entire period of its circulation.

Believing that the slanderous story was started on its course by parties who intended that the tale should injure his high reputation and prominent standing in Vancouver, Mr. Sperling has issued a notice offering a reward of \$10,000 for information which will lead to the identification and conviction of the person or persons responsible for the slanderous stories.

Fenders or Wheel Guards for Electric Railway Cars.

The Board of Railway Commissioners on Dec. 20 notified all electric railway companies under Dominion jurisdiction to file within 60 days plans showing the system of fenders or wheel guards in use on their equipment.

This action has probably been taken with a view to issuing an order requiring the companies to use certain fenders or wheel guards which may be approved by the Board.

The C.P.R. Telegraph Department has opened offices at Burdette, Noble and Woodhouse, Alta.; Fraser Mills station, B.C.; Bigwood, Mississippi, Walkerville Jct., Ont., and Amulet, Craven, Eve-sham, Imperial, Primate, Renown, Richardson, Rosetown and Young, Sask.

The Intercolonial Railway's New Deep Water Terminal at Halifax.

To such an unexpected extent has the volume of freight passing through the port of Halifax increased of recent years, that the Government Railways Managing Board has been forced to map out a comprehensive plan of extension by which it is hoped to care for the constantly increasing traffic on the Intercolonial Ry. An idea of its rapid growth may be gathered from the fact that last winter's traffic was 100% greater than that of the previous winter, and nearly 140% in excess of the winter before that.

Halifax has two terminal points—one known locally as "Deep Water" and the other as Richmond. The deep water terminal is located quite centrally in the city proper, off Water St., while the Richmond piers are in the town of Richmond, at the northern extremity of Halifax. It is at the deep water terminal that the major portion of the contemplated improvements will be made.

Fig. 1 gives an idea of the nature and scope of the present and prospective piers at the deep water terminal. As indicated, the plan of improvements gives four piers sufficiently large to accommodate steamers of over 700 ft. in length, considerably increasing the capacity of the terminal. One of these piers, no. 2, has been contracted for. New piers 3, 4, and 5, shown dotted, are as yet in prospect. The old piers, nos. 2 to 5 are shown in full.

The majority of the old piers were of small size. Old no. 2 was practically rebuilt 15 years ago, having a second story added six years ago. This was found inadequate for general purposes, as its south side was too short for long steamers, while the north side had a basin too narrow. Old no. 3, recently rebuilt, is still in good shape, and will probably be embodied in the completed scheme, as the plans indicate.

When it was finally decided to develop a comprehensive plan of expansion, John Kennedy, Hon. M. Can. Soc. C.E., consulting engineer, Montreal, was called in, and it was under his directions that the contemplated plan was developed, and is being carried out.

SCOPE OF SCHEME.—As mentioned, the plan of improvements makes provision for four new piers. Pier 2 will be 800 by 235 ft., with freight and passenger shed, of which more will be said hereafter. Pier 3, for freight purposes only, will have the same dimensions as no. 2,

and will be of the same construction. Pier 4 will also be 800 by 235 ft., with a two-storied passenger and freight shed similar to no. 2. Pier 5 is to be somewhat smaller, 650 by 190 ft., and is intended for the use of smaller coastwise steamboats and sailing vessels, as well as for transatlantic steamships. The basin width between piers 2 and 3 will

head further out in the location indicated. The cribwork of this new bulkhead is to be built in cribs or blocks reaching up to about 2 ft. above low water, above which point the cribwork is to be continuous. The facing of this cribwork is to be of squared timber, well fitted so as to be mud-tight. The top of the bulkhead will be finished off

Fig. 1. Deep Water Terminus at Halifax, Showing Old Piers, New Piers and Proposed Piers.

be 280 ft., between 3 and 4, 275 ft.; and between 4 and 5, 250 ft. It is the intention to dredge these basins to a minimum depth of 34 ft. below low water.

PIER 2 is the first one of the series to be designed, and construction is being pushed forward on the work, the contract for the pier itself with shed having been let to the Nova Scotia Con-

struction Co. with a coping of squared creosoted pine timbers. In fact, all timbers over 3 ft. above low water are to be creosoted, the proportions being 12 lbs. of creosote per cu. ft. of timber, except for planking, when the amount will be increased to 18 lbs. These proportions are called for in all creosoted members throughout the pier.

Fig. 2. Cross Section View of New Pier, Showing Construction.

struction Co. for \$914,600. This pier is located between the old immigration building and the Cunard pier. As the new pier merely touches the immigration building pier for a short distance, it is being retained, but the Cunard pier, owing to interference, is being completely removed.

Necessity requiring the widening of the yard to allow more room on Water St., it was decided to build a new bulk-

The immigration building wharf coming into the field of active operation, it became necessary to strengthen the faces not removed so that they might be protected from the dredging, which will lower the basin bottom to a clear depth of at least 34 ft. all over. The water in the immediate vicinity of the immigration pier is somewhat less, thus requiring the reinforcing. This is to be accomplished by driving sheet piling of

Fig. 3. Upper Floor of New Pier 2.

squared timber along the front face of the pier to the corner and for 30 ft. beyond the corner. For a further distance of 25 ft. the foundation and cribbing will be protected by round piling. The major portion of the square sheet piling is to be creosoted, and to be driven to a depth of 39 ft. or 5 ft. below the bottom surface.

Considerable difficulty was experienced in adopting some suitable mode of construction, owing to the peculiar conditions which existed, for, as the name implies, the water at this particular point is very deep. Near the outer end of the pier, the water is about 60 ft. deep, making operating conditions rather difficult. The bottom is formed of a substratum of rock, the stratum running nearly perpendicular. This presents a rough, uneven surface covered by a bed of gravel and hard pan, superimposed on a layer of thick mud. Near the outer end the mud layer is not very thick, increasing in depth nearer shore. The rough end of rock stratum gently slopes up towards the shore. At the outer end, rock depth is 67 ft., and inshore 44 ft. These unusual depths of rock bottom tended toward making construction even more difficult, precluding the use of wooden piles. These would not be desirable, even if practicable, owing to the presence of the *tredda navalis* and *limnoria*, which latter are very active at this point, destroying wooden piles at the water line.

At the same time, caisson work, while quite possible, had the two disadvantages of slowness of construction and high cost, so that it was finally decided to adopt reinforced concrete piles of the construction and large size shown in fig. 4. For piles over 70 ft. long the longitudinal rods are to be 1½ in. rounds; between 60 and 70 ft., 1¼ in. rounds; and under 60 ft., 1 in. rounds. Four extra 1½ in. longitudinal rods extend up for a short distance from the pointed end. Except near the point, which has the rods wound with ¼ in. round wire at a 2 in. pitch, the rods have ¼ in. wire stirrups at a 12 in. spacing. The longest of the piles weighs about 25 tons. The concrete composition consists of 1 part of cement to 4½ of aggregates, the latter being composed of about 1½ parts of sand to 3 of broken stone. Each pile is to be made at one filling of the mould, and the concrete thoroughly rammed into place, more particularly at the water line, as it is desired to produce a concrete practically impervious to water, in order to eliminate chipping from frost. The piles must set in the moulds at least 7 days, and not be lifted under 6 weeks nor driven in less than 8 weeks. To prevent undue strain while lifting, the piles are to be raised by special clamps located a fifth of the pile length from each end. The estimated maximum load to which each pile will be subjected when in use is between 86 and 85 tons, and in order to safely sustain this weight, they will all have to be driven through the hardpan to solid rock, steam hammer and water jet being used for the purpose. The bearing power is to be tested when deemed advisable by the engineer in charge, one of the suggested means being that of a floating weight of 180,000 lbs., which at low tide will apply itself to the pile under test.

Fig. 2 gives an idea of the cross-sectional arrangement of the pier, showing the method of arranging piling and diagonal bracing. Lengthwise of the pier the piles are to be spaced 18 ft. apart, but the lateral piling is variable, depending on location of greatest loads. Each bent contains 39 piles. To protect the piles between high and low tide levels from the effects of frost, an excellent means has been adopted, consisting of sheathing the pile over a space of 8 ft. with a double layer of creosoted planking, extending 6 ins. above and below high and low tide levels respectively, the tide rising 7 ft. The inner planking of 2-in. material runs longitudinally, while the outer, of the same thickness of material, is horizontal. The piles along the outer face of the pier have a 3-in. outer jacketing instead of the 2-in. elsewhere. By these means it is expected that in the most severe weather the frost line will fluctuate in the creosoted planking, and keep away from the concrete. The disintegrating action of the alternate freezing and thawing of the surface of the concrete in cold weather, as the tide rises and falls, is well understood. If at all porous, the water is absorbed, and will, upon freezing, expand, thereby chipping or scaling the pile surface. This is doubly prevented in the case of these piles by the sheathing just described, and the densely packed nature of the concrete in the pile. All piles, the heads of which when driven extend above the level of the bottom of the transverse girders, are to have the concrete cut away and the reinforcing embodied in the transverse girders and floor beams. The concrete slabs in all cases are to be poured immediately after the pouring of the beams and girders on which they rest, no joints being permissible between slabs and beams and girders.

Referring to the deep water terminal cut, fig. 1, it will be noticed that the intention is to have two railway tracks the length of the pier through the centre of the shed, and two outside, one on each side. These are shown to better advantage in the cross-sectional view, fig. 2. It will be noticed that the flooring is raised to the car deck level above the tracks to facilitate and expedite the handling of freight. To accommodate dray traffic through the shed, there are two roadway ramps at the Water St. end, one on each side.

SUPERSTRUCTURE OR SHED ON PIER.—When planning the building to be constructed on the pier, it was decided to have it fireproof throughout, and consequently it is to be constructed entirely of reinforced concrete floors and walls, and block concrete partitions. It is essential to have it fireproof, as otherwise a serious calamity might occur, for upwards of 3,000 immigrants will be housed in the building when two large well filled steamships come in at the same time.

The building is a two-storied structure. The lower floor is of the same dimensions as that shown in fig. 3, which is a plan of the upper story. The ground floor is a plain floor, for freight purposes, covering the whole surface of the building with a series of railway, steamship and customs offices and storerooms at the shore end on each side of the two central freight tracks. Along each wall, outside of which are the exterior tracks above referred to, there are a series of overlapping doors of sheeted steel frame construction. These can be slid along to form an opening at any desired place in the full length of the building. The posts throughout the building are so arranged as not to interfere

with the free use of freight car doors, both in the building and along the side. The interior tracks are also intended for passenger purposes as well, for loading the immigrant trains.

The upper story of the building, a plan of which is shown in fig. 3, is for passenger purposes exclusively. It is divided into three main divisions—bag-

Excessive Rates for Marine Insurance.

A subscriber in Montreal writes us as follows:—

"The question of marine insurance is one which affects the whole of the importers and exporters of Canada, as the transportation of their products has to

tions officials hope that a fair showing has been made, but there can be no doubt it will require some pressure to convince underwriters that Canadian owners can do very much better than those south of the line.

Stranding of the s.s. Cambodia.

An investigation into the cause of the stranding of the s.s. Cambodia, on Flag Island, Aug. 3, was held recently by L. A. Demers, Wreck Commissioner, assisted by Capt. Lohnes and Macdonald, as assessors. Following is a summary of the judgment: The court finds that the Cambodia was stranded owing to careless navigation on the master's part through failure to utilize the chart to ascertain the strength and direction of the currents, and non-usage of the lead in view of his proximity to land and dense fog. The captain, M. A. Oleson, is severely reprimanded. The court holds that the double drowning which resulted, was due to the improper method adopted by the deceased mate, who in lashing the anchor, displayed a lack of judgment, but it is pointed out that the master was indirectly supervising the mate's actions and could have instructed him to adopt a more seamanlike method. The master is therefore warned to pay stricter attention to the actions of his officers and men in future.

Grounding of the Steamboat Corunna.

Following is the judgment of L. A. Demers, Wreck Commissioner, re the grounding of the Canadian Lake Line steamboat Corunna on Welcome Island, near Port Arthur, Ont., Oct. 6, delivered at Montreal, Dec. 6:—

The master is in default for not being, or coming, on deck whenever the mate reported that the vessel's course had not been made good, and for having failed to give definite instructions to the mate regarding courses to be steered from one point to another, and leaving the navigating of the vessel entirely to the mate's judgment. It is also of the opinion that a determined course should have been given from Thunder Cape to Welcome Island, and thence to Port Arthur, and also that it was plainly the master's duty to demand from the owners an additional compass, as the one placed on board could not be considered efficient for all purposes. As it has been stated that the master was sick, and taking that into consideration, the court will show some leniency by suspending his certificate for three months from Nov. 23.

With reference to the mate, the court finds him in default, his navigation having been performed in a careless manner, and it is evident that he never kept a lookout and showed culpable indifference in executing his duties. No effort seems to have been made to determine the vessel's position, and the court has no option but to deal with him severely, and suspends his certificate for one year from Nov. 23.

Owners of vessels should see that their vessels are fully equipped with necessary instruments in order to afford every facility to the masters and officers to navigate. In the present case, the vessel should have had another compass so situated as to afford every facility to take bearings and determine at all times the position of the vessel, as well as the error, if any, due to any cause.

During October, 1911, two employes were killed and three injured in the course of their work in connection with the navigation of Canadian waters. One of the deaths was due to drowning and one to a fall.

Fig. 4. Construction of Reinforced Concrete Pile used for the Pier Piling.

gage rooms on the north and south sides extending the full length, with the exception of a distance of about 100 ft. at each end, and passenger rooms and offices along the whole length of the central part of the shed and across the full width at each end. The outer wall of each baggage room will have alternate doors and windows at 36 ft. door centres, so that it may receive passengers and baggage from any part of either two short or one long vessels up to the full length of the pier. The Canadian examination quarters are duplicated on the north and south sides of the shed, but the U.S. quarters are single and are approached from the north and south baggage rooms by overhead stairs and passages, so as not to interfere with the passages of the Canadian examination quarters. Near the middle of the length of the building are two suites of first and second, class passenger rooms, one suite on each side of the central hall. Each of these has liberal accommodation for about 50 first class and 170 second class passengers. Commodious steerage accommodation is also provided, as shown.

It is intended that the whole of both stories of the shed be lighted by electricity, and that the offices and passenger quarters of both floors be steam heated and supplied with water. It is not intended that the large baggage spaces shall be furnished with heating apparatus, because at the times when they are in most active use, steamers will be alongside, and several of the large doorways of the shed will be open, which would make heating impracticable, but apparatus can be added at any time should experience show it to be necessary.

The adoption of the plans for the deep water terminal improvements means a general shifting of the railway yard arrangements. The rebuilding of the recently constructed freight shed on another site will probably be necessary in order to provide easy approach curves to the new piers. Other equally extensive changes will likely be necessitated to bring about a completely harmonious arrangement.

The Department of Marine has given notice that the Hydrographic Survey and Tidal and Current Survey Branches have been transferred to the Department of Naval Service, and any persons desiring information respecting them should address the Deputy Minister of Naval Service. Communications respecting notices to mariners and aids to navigation should be addressed as heretofore to the Chief Engineer, Marine and Fisheries Department.

pay the insurance both of the steamers and the cargoes. It is well known in business circles that marine insurance to and from Canadian ports is very much higher than to United States ports, but few people appreciate the immense sum that this represents in competition with our United States competitors. Major G. W. Stephens, President of the Montreal Harbor Commissioners, has recently issued a plea for a readjustment of marine insurance rates on the St. Lawrence, which, however, only treats of one phase of the subject. The hulls of all our fleets of regular liners pay about 2% on their total value over similar lines to U.S. ports. The cargoes both east and west contribute at least double the rates charged to the U.S. lines, notwithstanding the fact that during the last 10 years over \$38,000,000 has been expended by the Canadian Government in improving aids to navigation, including lighting, buoying and deepening the channels and entrances to our ports.

"Our inland marine has also suffered through constant advance in rates on hulls. Previous to about 1903 the rate was 3 3/4% for the season, which included the risk of navigation through the canals down to Montreal. This rate has been put up to 6% on the Great Lakes, 7% to Kingston, and 8% to Montreal. The heavy losses on the large U.S. steamers in recent years was the principal cause of the advance, although the large number of casualties to Canadian boats contributed to the heavy losses to underwriters, but I am of opinion that if the Dominion Marine Association took up this matter in a practical way and had their risks insured direct with the companies and not through U.S. channels, they would succeed in gradually reducing these heavy premiums, both on their steamers and cargoes.

"The Department of Marine has already taken evidence on the subject, and several attempts have been made to bring about an improvement, but the trade associations should, in their own interests, support the efforts that have been made and bring the matter before the new Minister of Marine."

In connection with the foregoing it may be said that the Dominion Marine Association came to the same opinion as our correspondent some two years ago, and took definite action. Underwriters are now keeping track of Canadian tonnage enrolled in the Canadian Lake Protective Association in separate records, and, according to the showing made, Canadian vessel owners will, or will not, be entitled to better rates than United States owners. The insurance for 1911 has been done in this way, and the Canadian Lake Protective Associa-

The St. Lawrence Navigation Season of 1911.

The season of 1911 opened with the arrival of the Canadian Northern Steamships' s.s. Royal George at Montreal, Apr. 27, being about 16 days later than in 1910, and closed Dec. 4 with the departure of the Head Line s.s. Bray Head, for British ports. Reports generally state that in point of tonnage of freight and numbers of passengers, both inward and outward, the season was more successful than any previous one, notwithstanding the fact that it was shorter by 13 days, and that business was to some extent interfered with by the strike in British shipping and railway circles. The customs receipts for the season were \$11,638,763.01, against \$10,833,191.67 for the previous year. Of the 750 ocean going vessels arriving in Montreal, 398 were trans-Atlantic and 352 coasting. During 1910 the total of vessels was 719.

The C.P.R. steamship lines report 18,750 passengers eastbound, and 40,200 westbound, against 15,012 eastbound and 43,599 westbound in 1910. The freight returns of these lines show exports of 332,613 tons, and imports of 178,800 tons, against 331,955 tons exports and 184,804 tons imports in 1910.

The Canadian Northern Steamships, Ltd., reports 6,351 passengers eastbound and 13,204 westbound, against 4,047 eastbound and 9,428 westbound in 1910. Though equipped mainly for passenger trade, the two vessels of this service brought 12,750 tons of freight, and carried eastward 13,500 tons during the season.

The Allan Line reports that it carried 19,330 passengers eastbound and 61,709 westbound, against 14,238 eastbound and 61,688 westbound in 1910. The freight traffic was somewhat less than in 1910, which was a record year for the company.

The White Star-Dominion Line made two round trips less than in 1910, and carried 11,842 passengers more during 1911. The increase was entirely in eastbound traffic, there being a falling off in the westbound traffic.

All the other lines using the route report aggregate increases of traffic, both in passengers and freight. During the 1911 season the Cunard Line inaugurated its service to Canadian ports, with the steamships Albania, Ausonia and Ascania, which it acquired from the Cairn Line.

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

118. Nov. 20.—326. General, hydrographic, tidal and current surveys transferred to Department of Naval Service.

119. Nov. 23.—327. New Brunswick, south coast, Bay of Fundy, off Negor point, gas buoy moved to former position. 328. Nova Scotia, Madame island, West Arichat, light established on wharf. 329. Prince Edward Island, north coast, change in position of Darnley point front range lighthouse. 330. Prince Edward Island, north coast, date of removal of bell buoys from their stations for the winter. 331. Newfoundland, east coast, St. Mein bay, St. Anthony harbor, Egg point, new lighthouse, change in character of light.

120. Nov. 28.—332. Quebec, Chaleur bay, Ste. Adelaide de Pabos, light established. 333. Quebec, Gulf of St. Lawrence, Magdalen islands, Alright island, hand fog horn at Pointe Basse wharf. 334. Quebec, Gulf of St. Lawrence, Magdalen islands, Pearl reef, bell buoy established. 335. Quebec, River St. Lawrence, Langlois point, name.

121. Dec. 5.—336. Nova Scotia, Bay of

Fundy, Port Lorne, change in character of light. 337. Nova Scotia, North Atlantic ocean, Sable island, position of wireless telegraph station. 338. Quebec, River St. Lawrence, Bersimis river entrance, buoys placed. 339. Quebec, River St. Lawrence, Lake St. Peter, Riviere du Loup en haut, change in position of 122. Dec. 6.—340. Nova Scotia, south coast, Sambro gas and whistling buoy to be replaced during the winter months by lightship. 341. Quebec, Gulf of St. Lawrence, Anticosti lightship, change in characteristic of light, fog alarm and submarine bell.

123. Dec. 12.—342. Quebec, Lake St. Louis, buoys established between Dowker Island and Pointe Claire light. 343. Quebec, Ottawa River, Lake of Two Mountains, St. Placide, front range lighthouse increased in height. 344. Ontario, Lake Ontario, South Bay point, light discontinued.

124. Dec. 13.—345. Ontario, Georgian Bay, Owen Sound, back range lighthouse burnt down, back light temporarily discontinued. 346. Ontario, Georgian Bay, Thornbury, front light shown from tower, day beacon added to back light mast.

125. Dec. 16.—347. Nova Scotia, south coast, Mars head, off Grampus rock, can buoy replaced by bell buoy. 348. Nova Scotia, Cape Breton island, west coast, Friar Head boat harbor, light established. 349. Nova Scotia, Cape Breton island, west coast, Margrave harbor, front range light improved. 350. Quebec, Riv-

Turbine Steamship for British Columbia Coast Service.

The s.s. Queen Alexandra, which has been purchased by the C.P.R., as mentioned in our Nov., 1911, issue, and which is illustrated on this page, was built in 1902, at Dumbarton, Scotland, and has since been operated in the passenger service on the Clyde, in conjunction with her sister vessel, the King Edward. Her dimensions are: length, 270 ft.; breadth, molded, 32 ft.; depth, to main deck, 11½ ft.; to promenade deck, 18¾ ft. The engine equipment consists of three separate turbines, each driving its own line of shafting, the centre turbine being high pressure, the others low pressure. At the ordinary steaming speed, the centre shaft gives 700 and the other shafts 1,000 a minute. This high velocity renders it necessary to employ a number of screw propellers of comparatively small diameter, rather than one or two of large diameter at the stern, as usual. This vessel has five propellers, one about 4 ft. diam. on the centre line of shafting, and two of 3 ft. diam. on each of the side lines of shafting. Steam is supplied by a double ended cylindrical Scotch boiler at 150 lbs. pressure. In her builders' trials she attained a speed of 21.63 knots an hour.

The Clyde Turbine Steamers Co., Ltd., from which company the C.P.R. has purchased the vessel, reports a minimum of

Turbine Steamboat Queen Alexandra, for C.P.R. British Columbia Coast Service.

er St. Lawrence above Quebec, Pointe a Basile back range light improved.

126. Dec. 22. 351. British Columbia, Strait of Georgia, Ballenas Islands, change in position of lighthouse. 352. British Columbia, Queen Charlotte Islands, Hecate Strait, Moresby Island, Houston Stewart channel, Koya point, name.

127. Dec. 22. 353. Ontario, St. Joseph channel, Bamford island, light discontinued. 354. Ontario, Lake Superior, Caribou island light station, new lighthouse.

repairs to her machinery during the nine years of operating. She was recently sent to the builders' yard for overhauling and some alterations, and while there was damaged by fire. She is expected to leave shortly for the Pacific coast, and on arrival will be placed on the Vancouver-Nanaimo-Comox run.

The Canadian Northern Coal and Ore Docks Co. is reported to have given a contract for the doubling of its coal handling plant at Port Arthur to the Barnett-McQueen Co.

Niagara Navigation Company Acquires Two Other Lines.

The Niagara Navigation Co. issued a circular to its shareholders recently announcing that an opportunity having arisen to purchase the Hamilton Steamboat Co.'s steamboats Modjeska and Macassa, and its wharf property at Hamilton, and the Turbine Steamship Co.'s steamboat Turbinia, and wharf property at Hamilton, the directors considered it advisable to acquire these lines, which can be satisfactorily accommodated at the N.N. Co.'s Yonge St. docks, Toronto. Concentration of management should be an economic gain, and expansion of routes will be an advantage to the N.N. Co. The terms of the purchase provide for part payment in treasury stock and the balance in cash. Funds for the latter purpose will be obtained from money on hand and by the issue of 1,002 additional shares at par, viz., \$100. These shares will be allotted to those who were shareholders at the closing of the books on Dec. 15, and who subscribe for them by Jan. 3, in the proportion of one new share for every seven held on Dec. 15. The purchases include only the properties of the Hamilton Steamboat Co. and the Turbine Steamship Co., viz., the vessels and Hamilton wharves, and not the capital stock. The transfer of the property is to be made on Jan. 3.

The Hamilton Steamboat Co., Ltd., which was promoted by the late T. B. Griffiths and J. B. Griffiths, now Purchasing Agent, Dominion Power and Transmission Co., was incorporated in 1887, the first directors being B. E. Charlton, J. M. Lottridge, G. E. Tuckett, T. B. Griffiths, F. Armstrong, J. Wallace and Seneca Jones. In 1893 the late G. E. Tuckett secured a controlling interest. In 1906 this passed to Æmillus Jarvis, of Toronto, and associates, and in 1909 it was bought by J. C. Eaton, Toronto, who had previously acquired control of the Turbine Steamship Co., whose steamboat, the Turbinia, has been engaged in a losing competition with the Hamilton Steamboat Co.'s vessels. The officers and directors in 1911 were: President, J. C. Eaton; Vice President, R. Y. Eaton; Secretary-Treasurer, J. J. Vaughan; General Manager, W. E. Bishop; other directors, H. McGee, C. Booth and T. A. McCrea. The company has been very successful, and since 1902 has paid regular yearly dividends of 10%. Its capital stock is \$187,000, fully paid up.

The late T. B. Griffiths was General Manager in 1887 and 1888, J. B. Griffiths from 1889 to 1893, and F. Armstrong in 1894 and 1895. M. A. Kerr was Managing Director from 1896 to 1903. W. E. Bishop, who had been ticket agent at Toronto from 1890, when to Hamilton in 1896 as Manager, and was appointed General Manager in 1903, continuing to hold that position. The other officials are: P. J. Pear, Passenger and Freight Agent, Hamilton, and E. J. Callaghan, Toronto Agent.

The first boat operated by the company, the Mazeppa, which it acquired in 1887, and disposed of in 1899, was built at Hamilton in 1884, and ran between Hamilton, Burlington Beach and Burlington. She is screw driven, with engine of 50 n.h.p., and with dimensions: length, 101 ft.; breadth, 20 ft.; depth, 5.7 ft.; tonnage, 146 gross, 87 register. She is now owned by H. Oldfield, Parry Sound, Ont.

The Macassa was built at Port Glasgow, Scotland, in 1888, and rebuilt at Collingwood, Ont., in 1905. She is screw driven, with engine of 95 n.h.p., and with dimensions: length, 178.4 ft.; breadth, 24.1 ft.; depth, 16.3 ft.; tonnage, 529 gross, 234 register. She is valued at \$72,000.

The Modjeska was built at Yoker,

Scotland, in 1889, and is screw driven, with engine of 180 n.h.p., and with dimensions: length, 178 ft.; breadth, 31.1 ft.; depth, 12.3 ft.; tonnage, 678 gross, 461 register. She is valued at \$98,000.

The Hamilton real estate and wharves are valued at about \$27,000.

The Turbine Steamship Co., which was incorporated in Aug., 1903, has a capital of \$150,000. The principal promoters were Hamilton people, the late Timothy Eaton, of Toronto, being also interested. About 1906 the control passed to J. C. Eaton. The officers and directors for 1911 were: President, J. C. Eaton; Vice President, R. Y. Eaton; Secretary-Treasurer, J. J. Vaughan; Manager, J. A. Goodearle; directors, H. McGee and T. A. McCrea. The first manager was G. Ellis, the second W. Wilson, and the third, J. A. Goodearle.

The Turbinia was built at Hebburn-on-Tyne, Eng., in 1904, and arrived at Hamilton, Ont., June 18 of that year. She is equipped with three compound turbines of the Parsons type, one high pressure in the centre, and two low pressure, each operating one shaft carrying one propeller. Her dimensions are: length, 250 ft.; breadth, 33.2 ft.; depth, 12.6 ft.; tonnage, 1,064 gross, 603 register. The engine is of about 500 n.h.p. She is said to have cost about \$210,000. The company's wharves, warehouses, etc., in Hamilton are valued at about \$25,000.

At first the Turbinia ran between Hamilton and Toronto. It is claimed that the first year she cleared about \$20,000; the second year there is said to have been a loss of about \$3,000. The

Hamilton Steamboat Co. reduced its rates and made it impossible for the Turbinia to show a profit. In the winter of 1905-6 she was chartered by the Canada-Jamaica Steamship Co., and operated on a day run between Santiago, Cuba and Kingston, Jamaica, calling at Port Antonio. Debts were incurred which the owners had to settle, and a loss of over \$20,000 is said to have resulted, besides which the vessel was considerably battered about and had to be repaired. In the summer of 1907 she was operated between Toronto, Niagara and Lewiston, but could not successfully compete with the Niagara Navigation Co.'s line. She has also run at different times between Toronto and Lake Ontario ports west of Toronto, but has not been a financial success, being an expensive boat to run, and having, in the opinion of marine men generally, been erratically managed by constant changes of routes, etc.

The combined fleet will be operated under the Niagara Navigation Co.'s name, and will include, in addition to the three vessels purchased as above mentioned, the N.N. Co.'s Cayuga, Chipewewa, Corona, Chicora and Ongiara, the latter, operating on the Niagara River only. Plans for a new vessel, which will probably be a little larger than the Cayuga, are being prepared by F. E. Kirby, of Detroit, and a contract is expected to be let in the near future. If possible, the new boat, which will probably be built on Lake Ontario, will be got ready for the season of 1913, though it may not be possible to have her in service before 1914.

SAULT STE. MARIE CANALS TRAFFIC

The following commerce passed through the Sault Ste. Marie Canals for the season 1911:

The Canadian canal was opened April 22, and closed Dec. 13, 1911; season 236 days.

The U. S. canal was opened April 24, and closed Dec. 16, 1911; season 237 days.

Atlantic and Pacific Ocean Marine.

Alfred Holt, founder of the Blue Funnel Line, operating steamships to various parts of the world, including a line to British Columbia ports, died at Liverpool, Eng., recently.

The Donaldson Line s.s. *Almora* is undergoing an overhauling at Glasgow, Scotland, necessitated by the damage caused in heavy weather during November. The December sailing of the *Almora* was taken by the Head Line s.s. *Inishowen Head*.

The Gulf Transport Line s.s. *Inkula*, which is being transferred to the Canadian Mexican route, when the arrangements for the taking over of the Canadian Mexican Pacific Steamship Co., by the Union Steamship Co. are completed, is being transformed into an oil burner.

The Donaldson Line commenced its service between Halifax, N.S., and Glasgow, Scotland, Dec. 2, when the s.s. *Athenia* sailed from St. John for Halifax, afterwards proceeding to Glasgow. In past years the vessels of this line sailed direct from St. John, but in future they will call at Halifax.

The Minister of Trade and Commerce stated in the House of Commons recently that the Government's policy would be to liberally subsidize steamship lines from Canada to the West Indies and South America, and he believed that the negotiations in progress would lead to a much better service to Jamaica and British Guiana.

It is reported in Montreal that the Richelieu and Ontario Navigation Co. is negotiating with the Quebec Steamship Co. with a view to amalgamation. It is stated that the Quebec Steamship Co.'s service would be completely reorganized so as to allow of a direct service being maintained between Montreal, Quebec and Cape Breton.

The Dollar Steamship Lines Ltd., has been incorporated under the British Columbia Companies Act, to take over the Stanley Dollar Steamship Co., the M. S. Dollar Steamship Co., and the Hazel Dollar Steamship Co., all of which are being wound up. The incorporation is in the nature of an amalgamation of companies operating vessels from which the companies took their names, all being on the Canadian register at Victoria, where the company's registered office will be.

The C.P.R. s.s. *Empress of China*, which was wrecked off the Japanese coast, July 26, was floated Dec. 12. She had been abandoned to the underwriters, and the work of floating her was undertaken on their behalf by the London Salvage Association. It is said that repairs will be undertaken, a survey for the purpose of inviting tenders for the work having been made at Uruga, and that the contract will probably be placed with Japanese firms at Kawasaki or another firm at Hong Kong.

The Minister of Trade and Commerce stated in the House of Commons, Dec. 1, that the suggestion that the Government should operate a steamship line between Halifax, N.S., St. John, N.B., the West Indies and British Guiana, as a part of the Intercolonial Ry. system, in preference to paying large subsidies to private companies, was a valuable one. It would, however, be a new departure, and would mean an increase in the Intercolonial Ry.'s already large capital account, and also involve the co-operation of the Railways Department with the Trade and Commerce Department.

It is announced that the Elder Dempster Co., operating steamships between Canada and Gulf of Mexico ports, and South Africa, has been merged with the Union Castle Line and the Royal Mail Steam Packet Co. Since the death of

Sir Alfred Jones, the control of the Elder Dempster Co. has been in the hands of Lord Pirrie, head of Harland and Wolff, shipbuilders, Belfast, Ireland, who is also interested in the other companies named and in the International Mercantile Marine Co., which in turn controls the White Star-Dominion Line, running vessels between England and Canada. By agreement with the C.P.R., on the purchase of the Beaver Line, the Elder Dempster Co. is prohibited from operating between England and Canada.

In dealing with the operation of the Canadian Northern Steamships' Atlantic service, in the C.N.R. annual report, which was given in full in our last issue, Sir W. Mackenzie, President, stated that having regard to the organization necessary to be maintained and the demand for accommodation, which on different sailings could not be met, it was manifest that a further addition to the fleet should be made at an early date. He also said that negotiations were pending, and it was hoped that a satisfactory arrangement would shortly be made, whereby all the business offered to the steamship company could be accepted. Sir William, accompanied by D. B. Hanna, Second Vice President, Canadian Northern Steamships, Ltd., is at present in Europe, and it is likely that the matter will be dealt with during their visit.

The steamship *Nascopie*, which was launched at Wallsend-on-Tyne, Eng., Dec. 7, is being built to the order of Job Bros., Liverpool, and in conjunction with the Hudson's Bay Co. It will be employed in the Newfoundland seal fishery and in the company's work in the Bay. Job Bros. and Co. being the Newfoundland managers. She is 285 ft. long by 43½ ft. beam, and 29½ ft. deep, fitted with triple expansion engines, with two boilers working under forced draught. She will carry 2,500 tons d.w. on a comparatively small draught, and will have a speed of about 14 knots on trial trip. She is to attain the highest class at Lloyds, is exceptionally heavily built so as to run through ice of considerable thickness, and her fittings for her special trade will be most complete. She will have quarters for nearly 300 seafarers, besides the usual accommodation for navigating and engineering staff and crew.

The two steamships which the Allan Line has under construction in Scotland will have a displacement of about 25,000 tons, or 17,000 tons register. The dimensions will be: length, over all, 600 ft.; between perpendiculars, 570 ft.; beam, 72 ft.; depth, molded, 45½ ft. The sterns will be of cruiser form, thus enabling the steering gear to be located under the water line. The machinery consists of four turbines of the Parsons type, arranged in series, these vessels being among the first to have this system. The power will be about 19,000 shaft horse power, giving a speed of about 20 knots an hour. Arrangements are being made so that oil may be used as fuel, as well as coal, should the former be found economically suitable. Passengers will be accommodated on six decks, with capacity for 200 first class, 500 second class, and 1,000 third class passengers. Some of the first class state rooms will have baths attached, and such state rooms will be arranged as single berthed apartments. The social features, in addition to a library, music room, lounge and smoke rooms, will include a gymnasium, verandah, cafe and special card room. The vessels will be heated by electricity, steam or on the thermo-tank system, all three being applied to the first class quarters, the latter two to the second class, and the last to the third class. Anti-rolling tanks will be added to the bilge keels. The cargo capacity will be 3,000 tons, including the refrigerator space of 70,000 cub. ft.

Maritime Provinces and Newfoundland.

Capt. J. M. Allen, who had been engaged in marine life in the Maritime Provinces for a number of years, died at Halifax, N.S., Dec. 11, aged 75.

The Department of Marine has given notice that any of the bell buoys on the north coast of Prince Edward Island will be liable to removal from their stations for the winter at any time after Nov. 1 in each year, without any notice being given.

Hon. H. R. Emmerson, formerly Minister of Railways and Canals, has given notice that he will move in the House of Commons that in connection with an extension of the Intercolonial Ry., a modern steam ferry service be established across the Northumberland Strait for the transfer of cars between the Intercolonial and Prince Edward Island Rys., and that the gauge of the latter railway be changed to standard.

It is reported that the Eastern Steamship Co., operating steamships between St. John, N.B., and Boston, Mass., is to be consolidated with the Metropolitan and Maine Steamship Cos., the shareholders of the first named receiving \$3,000,000 in bonds and a similar amount of stock, for their present \$3,000,000 stock. It is also stated that representations have been made to the U.S. President on the subject, who has stated that an investigation will be made into the proposals.

Province of Quebec Marine.

J. A. Kane, who has been connected with the shipping business in Quebec for a number of years, died there recently, after a short illness.

V. Chateauvert, J. B. Letellier and N. Belleau have been appointed members of the Quebec Harbor Commission, in place of J. B. Laliberte, G. Tanguay and R. Larue.

It is reported that an arrangement has been made with the Quebec and Levis Ferry Co. for the operation of a ferry service between Quebec and the Island of Orleans during the winter.

The number of vessels which passed through the Lachine canal during the past season was 5,738, an increase of 157 over the previous season. The vessel tonnage was 3,761,323, and the merchandise tonnage 1,546,239.

The Sincennes-McNaughton Co. will, it is reported, place three additional tugs in service next season. Two of these will be built at Sorel, and the third is stated to be under construction in Glasgow, Scotland, and will be similar to the *Sin-Mac*.

The masters of vessels running into Montreal are forming an association to look after their interests generally. A press report states that nearly all the masters engaged in the local trade have signified their intention of joining, and that Capt. Mondon, of the Richelieu and Ontario Navigation Co., has been elected President for the current year.

The Minister of Marine has introduced a bill to amend the Quebec Harbor Commissioners Act, by providing that the commission shall consist of three members to be appointed by the Government in the same way as the Montreal Harbor Commission. At present the Quebec Commission consists of nine members, five being appointed by the Government, two by the shipping interests, and one each by the Quebec and Levis Boards of Trade.

The United States steamboat *Raleigh*, which was wrecked near Port Colborne recently, and in which disaster three lives were lost, has become a total loss. It is reported that she was not insured.

Ontario and the Great Lakes.

During the past season the Montreal Transportation Co. is reported to have handled 3,000,000 bush. more grain than in any previous season. The greater part was trans-shipped at Kingston.

The St. Lawrence and Chicago Steam Navigation Co. has declared a 5% dividend for 1911, against 3% for 1910. The dividends in previous years were: 1901, 15%; 1902, 26%; 1903, 10%; 1904, 8%; 1905, 6 and 7, 10%; 1908, 7%; 1909, 8%.

The Port Bruce Fish Co.'s steam tug Governor Morton was destroyed by fire near Port Bruce, Dec. 2. She was built at Chicago, Ill., in 1893, and was screw driven by engine of 6 n.h.p. Her dimensions were, length 51.8 ft., breadth 10.4 ft., depth 4.4 ft., tonnage 15 gross, 10 register.

C. A. Magrath, ex-M.P. for Medicine Hat, Alta.; T. C. Casgrain, K.C., of Montreal, and H. A. Powell, K.C., of St. John, N.B., have been appointed members of the Canadian section of the International Deep Waterways Commission, in place of Sir George Gibbons, A. Geoffrion and A. P. Barnhill.

Toronto press reports stated recently that Capt. Jas. McMaugh, of Toronto, had died in California, and this item was reproduced in our last issue. The report was, however, in error. The death which occurred was of Robert, a brother of Capt. Jas. McMaugh, who went to California to attend the funeral.

The George Hall Coal Co., Montreal, has placed orders for two steel steamboats, specially designed for the coal trade between Charlotte, N.Y., and Montreal. They will be 250 ft. long, with a carrying capacity of 2,100 tons on 14 ft. draught, and with a speed of 12 miles an hour. It is anticipated that they will be ready for service by May 1.

Toronto press reports of Dec. 6 stated that the Niagara, St. Catharines and Toronto Navigation Co. had decided to build a sister vessel to the Dalhousie City, for operation by the spring of 1913, to Port Dalhousie. We have been officially advised that although it is probable another vessel will be built sometime in the future, the report as quoted is incorrect.

Plans for improvements in Belleville harbor are being submitted to the Public Works Department. They show the construction of a cement pier 50 ft. wide, from Church St. into the bay, 70 ft. long, at the end of which a dock, 300 ft. by 15 ft., L shaped, will be built with sheds and cold storage railway accommodation. Provision is also made for dredging the harbor to 12 ft.

The Merchants Mutual Line has placed an order for the building of a lake freighter at Port Arthur. The dimensions will be: length, 257 ft.; beam, 48 ft.; depth, 28 ft. She is designed specially for the bulk and package freight trade between the Great Lakes and Montreal, and is expected to be ready for operation some time during next season.

The Thousand Islands Steamboat Co. is having built at Toledo, Ohio, an additional steamboat, specially adapted for the Thousand Islands service. She will be 175 ft. long by 32 ft. beam, screw driven, with a speed of 16 or 17 miles an hour. She will have accommodation for about 1,000 passengers, and is expected to be ready for placing on her route by June 1.

The Peterborough and Lake Simcoe Navigation Co., Ltd., which was incorporated under the Ontario Companies Act, in 1910, with \$250,000 capital, and office at Peterboro, Ont., has assigned to W. Buller, Peterboro. At a recent meeting of creditors it was agreed to adver-

tise the sale of the assets by tender. Bids for the four steamboats, four barges and wharf and warehouse at Ashburnham will be received to Jan. 8.

W. B. Russell, who has the completing of the Newmarket canal in hand, is reported to have stated recently that it was almost finished, the canal having reached to within a quarter of a mile of Holland Landing, being 4½ miles from Newmarket. The work included the building of three locks and the excavation of 900,000 yds. of earth. The cost to date has been stated as \$1,000,000.

In our December, 1911, issue, in referring to the proposed lengthening of the Western Navigation Co.'s s.s. Kaministiquia, we inadvertently gave the dimensions of a tug of the same name registered at Port Arthur. The Western Navigation Co.'s vessel was built at Wallsend, Eng., in 1909, and is registered at Newcastle, Eng. She is of full welland canal size, equipped with engine of 250 n.h.p., driving a screw, her tonnage being 2,173 gross, 1,401 register.

The bill to amend the Canada Shipping Act, recently introduced into the House of Commons has particular reference to the amendment of sec. 477. It is claimed that that section discriminates against Ontario vessels in the payment of pilotage dues in Montreal harbor, and the object of the bill is to place the Ontario vessels on a parity with other vessels. At the request of the speaker, who considered it a matter which should be proceeded with by resolution, as affecting trade, the bill was withdrawn.

The United States Lake Survey reports the levels of the Great Lakes in feet above tidewater during November as follows:—Superior, 602.06; Michigan and Huron, 579.36; Erie, 571.13; Ontario, 244.50. As compared with the average November levels for the past ten years, Superior was 0.64 ft. below, Michigan and Huron were 1 ft. below, Erie 0.11 ft. below, and Ontario 1.05 ft. below. It was anticipated that during December, Superior would fall 0.3 ft., Michigan and Huron 0.2 ft., Erie 0.1 ft., and Ontario 0.2 ft.

The vessel which is under construction at Detroit, Mich., for the George Hall Coal Co., for the coal trade between Montreal and Charlotte, N.Y., will be of full canal size, with dimensions as follows: length, 257 ft. breadth, 43 ft.; depth, 21 ft. She will be of girder construction, and equipped with triple expansion engines, with cylinders 18, 29 and 48 ins. diam. by 40 ins. stroke, supplied with steam by two Scotch boilers, 12 ft. diam. by 11½ ft. long, fitted with induced draught, and she will be built under the rules of and classed 100*, in the Great Lakes register.

The Ministers of Marine and Public Works visited Toronto, Dec. 12, for the inspection of the harbor. A list of needing improvements was handed to the Ministers for their consideration, and included the closing of the old western channel, extensions to the present western channel, the widening of the approach, and the deepening of the eastern channel, the protection of the south shore of the island, more effective lights and signals, the general deepening of the harbor, provision of necessary equipment at the western channel and a central life-saving station with equipment and permanent staff for the north shore of Lake Ontario. The Minister of Marine stated that the matter of lights and signals, the only part which came under his jurisdiction, would be dealt with at an early date, and the Minister of Public Works, whose department is concerned with the remainder of the proposals, promised every consideration regarding the proposed improvements.

Manitoba, Saskatchewan and Alberta.

The Saskatchewan River Coal and Navigation Co., Ltd., has been incorporated under the Saskatchewan Companies Act, with \$100,000 capital and office at Prince Albert, to carry on a general coal and navigation business.

The Robert Ackland Co., Ltd., has been incorporated under the Manitoba Companies Act, with \$20,000 capital, and office at Winnipeg, to take over the boatbuilding business at present carried on by R. D. Ackland, to conduct a general shipbuilding business, and to operate passenger and freight vessels.

The report of the engineers recently engaged on survey work on the Saskatchewan River, in charge of L. R. Vongny, and which has been submitted to the Public Works Department, states that the river can be made navigable for shallow draught vessels, running between Prince Albert and the Pas. The estimated cost is \$1,500,000.

The draft bill for the creation of the proposed commission to administer the harbors of Winnipeg and St. Boniface was discussed at a meeting of the committee on wharfage and dockage, at Winnipeg, Dec. 15. It provides for a commission of not less than five members, three being appointed by Winnipeg and two by St. Boniface, for three years. The details are similar to those dealing with the commission's work in connection with Montreal and Toronto harbors.

A deputation of those interested in the navigation of the Red River, recently appointed to interview the Ministers of Public Works and Marine, in their report to the Winnipeg board of trade, Dec. 7, state that instructions have been given to complete as much of the work of improving the Red River channel as possible before the opening of navigation and it was also promised that other matters would be carefully considered. A bill is to be introduced by the Minister of Public Works to create a harbor board for Winnipeg and St. Boniface.

British Columbia and Pacific Coast Marine.

The Crescent Shipping Co., Ltd., has been incorporated under the B.C. Companies Act, with \$50,000 capital and office at Victoria, to own and operate steam and other vessels and to carry on a general freighting business.

The Union Steamship Co. is reported to have taken over the business of the Vancouver Steamship Co. on Howe Sound, including the mail contract. The service will, it is said, be performed by the s.s. Cheslakee in place of the s.s. Tartar.

C. H. Nicholson, Manager, G.T.P. Coast Steamship Co., who returned to Vancouver recently from Victoria and Seattle, is reported to have stated that the local management of the company's dock at Seattle, Wash., has been transferred to F. Waterhouse and Co., whose offices will be there in future.

It is reported that the mail contract between the mainland and the islands has been awarded to the C.P.R., and will be carried out by its coast steamships. It was formerly held by the owners of the wrecked Iroquois, and since that disaster has been continued by a service of gasoline launches.

The repairs on the C.P.R. s.s. Princess Beatrice, necessitated by her grounding on Noble Island at the end of October, have been completed, and in addition she has been thoroughly overhauled. It is stated that she will take the place of the s.s. Tees, which recently ran aground in Kyuquot Sound, or the s.s. Queen City.

Press reports state that the steam yacht *Dolaura*, owned by Jas. Dunsmuir, director, C.P.R., will probably be purchased by the Dominion Government for the fisheries protection service on the B.C. coast. She was built at Paisley, Scotland, in 1908, and is stated to be on the market for about half her original cost.

The Vancouver Harbor and Dock Extension Co. has announced that work will be commenced about Apr. 1 on the proposed dock construction at Vancouver. C. F. Pretty, President, after a conference with the B.C. Premier, intended leaving for Ottawa to lay the plans and proposals before the Dominion Government.

It is reported that Twohey Bros., who have the contract for grading 100 miles of the Canadian Northern Pacific Ry. along the Thompson River valley, are building a modern light draught river steamboat, to be used in connection with the work. The dimensions will be: length, 135 ft.; beam, 35 ft.; draught, loaded, 3 ft.

Arrangements are being made for the commencement of construction of the B.C. Marine Railway Co.'s dry dock at Esquimalt in the spring. It is stated that it will be largest on the continent, being 1,000 ft. long, 100 ft. wide, 120 ft. wide at the top and 36 ft. deep. The site has been selected at Lang's Cove, adjoining the present shipyards.

The Victoria Lumber and Manufacturing Co.'s steam tug *Chemainus* was destroyed by fire recently at Vancouver. She was built at Chemainus in 1909, and was screw-driven by engine of 40 n.h.p. Her dimensions were, length 93.4 ft., breadth 22 ft., depth 9.8 ft., tonnage 153 gross, 71 register. She has been raised, and it is stated that she will be repaired and again put into service.

The vessel which the C.P.R. is having built at Victoria for its British Columbia coast service will be 240 ft. long, 38 ft. broad and 17 ft. deep, with accommodation for about 600 tons of freight in addition to passengers. The hull will be of steel throughout and it is expected that she will be launched next fall in time for completion for the spring of 1913. The material is being assembled and the laying of the keel will take place in the spring.

It is reported that the C.P.R. is offering its s.s. *Amur* for sale, and that her place will be taken by the s.s. *Princess Sophia*, now under construction at Paisley, Scotland. The *Amur* was built at Sunderland, Eng., in 1890, and is screw-driven by engine of 150 n.h.p. Her dimensions are, length 216 ft., breadth 28 ft., depth 17.9 ft.; tonnage 907 gross, 570 register. She has been lying at Esquimalt, where she was taken after stranding in the Wrangel narrows last summer.

Material is being assembled at Fraser Mills for the construction of three stern wheel steamboats for operation in the spring between Tete Jaune Cache and Fort George. Two of these vessels are intended for Foley, Welch and Stewart, G.T.P.R. contractors, and the third is for the British Columbia Express Co. The two former will be 140 ft. long with a carrying capacity of 250 tons, and they will be equipped with the machinery from the same owners' two steamboats *Conveyor* and *Operator*, which were run last year on the Skeena River. The B.C. Express Co.'s vessel will be 118 ft. long, 25 ft. beam, with a speed of 14 miles an hour.

The C.P.R. s.s. *Tees* ran aground on a sunken rock in Kyuquot Sound, Nov. 29, breaking her propeller blades and bending her rudder post. It is stated that attempts to get into wireless communication with coast stations failed, and that the chief officer and four of the crew who left in an open boat to row to Estevan for aid were lost in the fog, and

were picked up in an exhausted condition, Dec. 2, by the Dominion fisheries tug, *William Joliffe*, sent out to look for the *Tees*. Eventually the passengers were transferred to the s.s. *Salvor*, and the *Tees* was released and towed to Victoria by the company's tug *Nanoose*.

The C.P.R. s.s. *Princess Sophia*, which was launched at Paisley, Scotland, recently, is intended for the Vancouver, Victoria and Queen Charlotte Islands route. She is a single screw vessel, 245 ft. long, 44 ft. beam and 18 ft. deep, specially designed for the coast service. She will be equipped with electric lighting installation, wireless telegraphy and steam heating. Freight will be carried on the main deck, the passenger quarters being arranged on the upper, promenade and bridge decks. The christening ceremony was performed by Miss Piers, daughter of A. Piers, Manager, C.P.R. Steamship Lines, Liverpool, Eng.

The Union Steamship Co.'s s.s. *Chelohsin*, which will shortly be placed in service on the northern coast route, alternately with the s.s. *Venture*, now under the same control, has recently been completed at Belfast, Ireland, the hull having been built at Dublin. She is 175 ft. between perpendiculars, with 35 ft. beam, and built under the survey of the British Board of Trade and British Corporation, and specially strengthened for her service. The first class passenger accommodation is on the awning and shade decks. The dining saloon is on the main deck with companion way to the awning deck and has accommodation for 60 passengers. There is a large observation room on the awning deck, communicating with all the other decks. The machinery consist of two sets of balanced crank triple expansion engines, supplied with steam by two large boilers at 185 lbs. pressure. The auxiliary machinery comprises centrifugal, circulating, feed, bilge and sanitary pumps, evaporator, etc. On her trial run before leaving Belfast she attained a speed of 14.29 knots an hour, and 13 knots with 500 tons deadweight, in fairly rough weather.

TRADE AND SUPPLY NOTES.

The matter which appears under this heading is compiled, in most cases, from information supplied by the manufacturers of, or dealers in, the articles referred to, and in publishing the same we accept no responsibility. At the same time we wish our readers to distinctly understand that we are not paid for the publication of any of this matter, and that we will not consider any proposition to insert reading matter in our columns for pay or its equivalent. Advertising contracts will not be taken with any condition that accepting them will oblige us to publish reading notices. In other words, our reading columns are not for sale, either to advertisers or others.

The Reid Newfoundland Co. has ordered one double-equipped no. 323A motor from the Westinghouse Electric and Manufacturing Co.

The Robb Engineering Co., Amherst, N.S., has recently sold return tubular boilers to A. Fraser, Clementsvalle, N.S., and L. Irving, Billtown, N.S., and a heating boiler to Gorman, Clancey and Grindley, Edmonton, Alta.

John Millen and Son, Ltd., Montreal, held their second annual sales convention there, Dec. 11 and 13, which was attended by their salesmen and a number of representatives of companies, etc., for which they are agents, F. D. Lyman, Manager of the Railway Supply Department, being the convention secretary. The convention work included addresses by the representatives above referred to, and the social features included theatre parties, a supper and a bowling contest.

The Canadian Locomotive Co.'s management has not, it is said, decided whether the proposed enlargement of its plant will be made by additions to the

present plant at Kingston, Ont., or by the erection of an additional plant elsewhere. A site has been bought near Montreal, on the south bank of the Lachine canal, as a precautionary measure, in case it should be required, and Hamilton and Welland, Ont., are also being considered. The Kingston city authorities will doubtless do everything possible to hold the business there, and will probably offer a fixed taxation for a number of years, and other inducements.

The Baldwin Locomotive Works, Philadelphia, Pa., has issued record 71 dealing with locomotives built recently for industrial and contractors' service. The booklet gives illustrations and descriptive data of locomotives, suitable for industrial or contractors' service. In work of this character unusual operating conditions are frequently met, and the locomotive must be designed accordingly. Those shown have, in practically every instance, been built to meet special requirements. They cover a wide range in capacity, from light narrow gauge equipment in railway yards or large industrial establishments. In all the designs shown, truck wheels are omitted; and the entire weight of the locomotive (including, in some cases, the weight of fuel and water) is available for adhesion. The number of pairs of driving wheels used in each case, must be sufficient to carry the weight of the locomotive without overloading the track and bridges. The spacing of the wheels must be governed primarily, by the radius of the sharpest curve which the engine is required to traverse. By grouping the wheels compactly, locomotives of the types illustrated can readily be designed to enter the sharp curves and switches usually found on industrial railways. At the same time, maximum hauling capacity is secured by placing the entire weight of the locomotive on the driving wheels.

Toronto Viaduct and Union Station.—Further consideration has been given by the Board of Railway Commissioners to the plans for the viaduct along the Toronto water front and the proposed Union Station. The railway companies, the City Council and the Board of Trade could not agree on certain portions of the plans under consideration, and the various matters were adjourned until Feb. 8, when the C.P.R. will submit plans for a union station, which may solve the difficulties in the viaduct plans which the other plans are said to have developed.

A Dominion Government vessel is to be placed at the disposal of Prof. Barnes, of McGill University, Montreal, in June, for experiments in the Straits of Belle Isle with an instrument for detecting icebergs, which he has invented.

The Dominion Government has been asked by the Alberta and Great Waterways Ry. to disallow the act passed by the Alberta Legislature early in 1911, cancelling the agreement for the construction of the line.

The Fort Churchill Trading Co., Ltd., has been incorporated under the Dominion Companies Act, with \$100,000 capital and office at Winnipeg, to carry on a general trading and development business, and in connection therewith to operate vessels, wharves, docks, piers, warehouses, elevators, etc.

The Chaleur Bay Lumber Co., Ltd., has been incorporated under the Dominion Companies Act, with a capital of \$200,000 and office at Port Daniel, Que., to acquire the assets of the Port Daniel Lumber Co. to carry on a general lumbering business, and in connection therewith to operate vessels, piers, wharves, etc. The incorporators are,—P. O. Viall, C. R. Taylor, Port Daniel, Que.; L. D. Crear, Rutherford, N.J.; J. W. Vickerman, Cleveland, Ohio, and J. C. McDermott, Wellington, Ohio.

Among the Express Companies.

The Canadian Ex. Co. has been registered under the act respecting foreign corporations, to carry on business in Saskatchewan.

The Adams Ex. Co. is stated to be considering the question of opening an office in Vancouver, B.C., for the handling of import and export freight only.

The Board of Railway Commissioners has approved the standard tariff of maximum mileage tolls between all offices of the Alberta Ry. and Irrigation Co.'s express department.

The Canadian Northern Ex. Co. has resumed service west of Kindersley, Sask., and is receiving shipments for Alaskan, Fairmount, Harwell, Marengo, Merid and Pinkham, Sask.

J. D. Chilman, a former employe, and J. Acheson were committed for trial at Hamilton, Ont., Dec. 20, in connection with the recent robbery of about \$8,000 from the Canadian Ex. Co. there.

The Board of Railway Commissioners has extended the delivery and collection limits for express companies in Walkerville, Ont., to include all territory bounded on the north by the Detroit River, on the east by Maisonsville Road and on the south by Edna St.

The Dominion Ex. Co. is suing A. Dini, a steamship agent in Montreal, for \$3,998.59 for money orders supplied to him as its agent. The defence put in by Dini, is that he never sold nor issued any Dominion Ex. Co.'s money orders, nor had anyone any authority to sign his name to such orders.

In connection with the complaint of the town of Montcalmville, Que., before the Quebec Public Utilities Commission, respecting the delivery and collection limits of the Dominion and Canadian Ex. Cos., as mentioned in our last issue, the commission has decided that it has no jurisdiction in the matter, the companies being controlled by the Board of railway Commissioners.

The British Columbia Ex. Co. is building another steamboat, and will operate it on the Fraser River, between Tete Jaune Cache, at the head of navigation, over the Yellowhead Pass, and Fort George. The company's other vessel is running between Soda Creek and Ashcroft, 200 miles east of Vancouver. A. Hutchison and C. Millar, of Toronto, are President and Manager respectively, and Willis West is Superintendent at Ashcroft, B. C.

The Board of Railway Commissioners passed the following order, 15411, dated Dec. 17, re application of W. J. Guest Fish Co. of Winnipeg, complaining that the Dominion Express Company had increased the rate on fresh fish, exclusive of ice, from Gimli to Winnipeg, from 60 to 80 cents per 100 lbs., and applying for an order directing the company to readjust its fish rates in Manitoba. It is ordered that the Dominion Express Co. forthwith restore, as a special tariff, its so-called Standard Tariff C.R.C. 15, from 26 to 170 miles, inclusive, in effect prior to Oct. 15, 1911, and in so doing, that it define more clearly the points between which the said tariff shall apply.

In accordance with the Board of Railway Commissioners' recent order, as given in our last issue, in connection with interchange business and through waybilling, the express companies have issued instructions to agents, etc., that commencing Jan. 1, shipments forwarded from common or exclusive points destined to offices of other companies in Canada, must be waybilled through to destination. Shipments destined to station shown as star stations in the tariffs, points on railways where there are no agents, and prepaid packages, must be waybilled direct to

such stations. On shipments subject to graduate charges and carried between offices in Canada, one or both of which offices being exclusive, the through charge will be the single graduate based on the combined merchandise rate per 100 lbs. from point of origin to destination, by way of the transfer point named in the transfer tariff, which produces the lowest through charge, with a minimum through charge of 60c except that between points where the combined rates on merchandise are less than \$2 per 100 lbs. the minimum through charge will be the graduated charge under \$2 per 100 lbs., provided that in no case shall the charge on less than 100 lbs. be more than for 100 lbs. at the through rate, nor more than the sum of the local graduated charges. Between common points, where a joint through merchandise rate is in effect, the minimum through charge will be the same as if carried by one company. Agents are instructed that it is important that forwarding offices note on the waybill the transfer point through which the charge is figured, also the 100 lbs. rate of each company to and from the transfer point, the name of the place where the shipment is transferred to or received from another company. Through charges will be pro-rated on the basis of the local merchandise rate of each company. No company, however, will receive less than 10c, except where two or more companies perform service in competition with one company.

Telegraph and Cable Matters.

The Board of Railway Commissioners will sit at Ottawa, Jan. 8, and proceed with the general enquiry into the tariffs of tolls or telegraph companies and the settlement of proper forms for telegraph companies to use.

The Premier stated in the House of Commons recently that the Dominion Government had approved of the proposal to lay a direct cable from Auckland, New Zealand, to Sydney, Australia, and that Canada would pay five-eighths of the deficits arising out of its operation.

The Michigan Central Rd. station agents, telegraph and telephone operators in Canada have applied to the Department of Labor for the appointment of a conciliation board to take up matters connected with their working conditions and rates of pay, with a view to arranging a new schedule.

The Board of Railway Commissioners has extended the time within which the North American Telegraph Co., Bell Telephone Co., White Pass and Yukon Route, Canadian Pacific Telegraph Department, Grand Trunk Pacific Telegraph Co., Canadian Northern Telegraph Co., and Great North Western Telegraph Co. may charge the telegraph and telephone tolls which they were, immediately previous to July 13, 1906, authorized to charge, by 7 and 8, Ed. VII., ch. 61.

C. Bright, a son of the late Sir Charles T. Bright, who laid the first Atlantic cable, recently gave an address before the London, Eng., Chamber of Commerce, in which he advocated the appointment of a commission with overseas representation to investigate the question of Imperial telegraphs. It was eventually decided to make strong representations to the Government to co-operate with the various Dominion Governments, and especially with Canada, for the establishment of an independent and strictly all-British transatlantic cable and land line connecting with the Pacific cable.

The following changes of the C.P.R. telegraph officials are announced:—
F. J. Mahon, heretofore Superinten-

dent, Atlantic Division, St. John, N.B., has been appointed Superintendent, Eastern Division, Montreal, vice J. F. Richardson, transferred.

J. T. Tait, heretofore Superintendent, Manitoba Division, Winnipeg, has been appointed Assistant to the General Superintendent, Western Lines, Winnipeg.

J. McMillan, heretofore Superintendent, Alberta Division, Calgary, has been appointed Superintendent, Manitoba Division, Winnipeg, vice J. T. Tait, promoted.

D. Coons, heretofore Inspector, Manitoba Division, Winnipeg, has been appointed Superintendent, Alberta Division, Calgary, vice J. McMillan, transferred.

J. F. Richardson, heretofore Superintendent, Eastern Division, Montreal, has been appointed Superintendent, British Columbia Division, Vancouver, vice J. Fletcher, reported to have been appointed Superintendent of Traffic, Eastern Division, Montreal.

The P. Lyall and Sons Construction Co. has been incorporated under the Dominion Companies Act with \$3,250,000 capital and office at Montreal, to carry on an engineering, railway and general contracting business. The provisional directors are:—E. Languedoc, E. R. Perkins, A. C. Calder, S. G. Dixon, J. M. Montle, R. Brodeur, W. Taylor, Montreal.

NOTICE TO CONTRACTORS.

Tenders for Rails and Fastenings.

SEALED TENDERS, addressed to the undersigned, and marked on the envelope "Tender for Rails" and "Tender for Rail Fastenings," as the case may be, will be received at the office of the Commissioners of the Transcontinental Railway, Ottawa, Ont., until 12 o'clock noon of the 24th day of January, 1912, for approximately 14,468 gross tons of 80 lb. steel rails and the necessary rail fastenings.

Tenders must be made on the forms supplied by the Commissioners, which, with information with respect to the deliveries required, may be had on application to Mr. Gordon Grant, Chief Engineer, Ottawa, Ont.

Tenders must be signed and sealed by all the parties to the tender and witnessed, and be accompanied by an accepted cheque on a chartered bank of the Dominion of Canada, payable to the order of the Commissioners of the Transcontinental Railway for a sum equal to ten per cent. (10 p.c.) of the amount of the tender.

The right is reserved to reject any or all tenders.

Newspapers inserting this advertisement without authority from the Commissioners will not be paid for it.

By order,

P. E. RYAN,

Secretary.

The Commissioners of the
Transcontinental Railway.

Dated at Ottawa, December 13th, 1911.

NOTICE IS HEREBY GIVEN that the Grand Trunk Railway Company of Canada will apply to the Parliament of Canada, at its present Session, for an Act confirming and declaring to be legal and binding the agreement made the 1st day of December, 1911, between the Temiskaming and Northern Ontario Railway Commission and the said Company, providing for the joint use by the parties thereto, upon the terms in said agreement set forth, of the line of railway of the Commission between North Bay and Cochrane, and authorizing the said Company to run and operate its trains over and upon that portion of the line of railway constructed by the Commission from a point at or near Nipissing Junction to North Bay.

Dated at Montreal, this 5th day of December, A.D. 1911.

How Much Oil Do You Waste?

Thousands of dollars are lost every year through the wasteful use of lubricating oils. The average method of storing and distributing oils in railroads, shops, steamships, etc., is so crude that loss is unavoidable. This condition is not intentional, but is due to the fact that nothing better has been brought to the attention of the officials that would systematize the oil room and eliminate excess loss and labor.

Do you know just how much oil is used and for what purpose? Do you know who obtains oil and in what quantities?

The Bowser Storage System

is self-measuring and metering. It accurately measures the oil and records every drop passing through the pump. It is fitted with a lock so no one can obtain oil except the person authorized.

The oil can be stored underground if desired and delivered in the oil room.

The Bowser all steel roll top cabinet is especially adapted for engine-room purposes. It gives the room a neat and clean appearance, prevents waste, protects the oil from dust and dirt and is fire-proof.

The Bowser System will decrease the oil expense wherever it is installed. Styles to meet all conditions and prices very reasonable.

The Government and hundreds of the largest industries in the world are using Bowser Systems because they pay.

Let us send you bulletins explaining the complete line. Ask for bulletin No 18.

A HISTORY OF THE PAY-AS-YOU-ENTER CAR AND ITS LESSON

The following cities are using Pay-As-You-Enter Cars: Chicago City Railway, 839 cars; Chicago Railways, 1,328; Public Service Corporation of New Jersey, 466; New York City Railway, 555; Third Avenue Railroad, New York, 550; International Railway, Buffalo, 200; Buffalo & Lake Erie Traction Co., 10; Washington Ry. & Elec. Co., Washington, D.C., 100; Capital Traction Co., Washington, D.C., 51; Municipal Traction Co., Cleveland, Ohio, 180; United Rys. Co. of St. Louis, Missouri, 310; Portland Ry., Lt. & Pwr. Co., Portland, Ore., 25; Columbus Ry. & Lt. Co., Columbus, Ohio, 10; Wichita R.R. & Lt. Co., Wichita, Kan., 14; Jacksonville Elec. Co., Jacksonville, Fla., 5; Dallas Elec. Co., Dallas, Texas, 20; Houston Elec. Co., Houston, Tex., 41; Northern Texas Trac. Co., Ft. Worth, Texas, 25; Ithaca Street Ry., Ithaca, N.Y., 2; Peoria Street Ry., Peoria, Ill., 13; Urbana & Champaign Ry., Champaign, Ill., 3; Mutual Lt. & Water Co., Brunswick, Ga., 4; Rochester Ry. Co., Rochester, N.Y., 25; Ft. Dodge, Des Moines & So. R.R. Co., 2; Muskogee Elec. Trac., Muskogee, Okla., 6; Union Traction Co., Dubuque, Ia., 4; Topeka Ry. Co., Topeka, Kas., 12; United Rys. & Elec. Co., Baltimore, Md., 32; Detroit United Ry., Detroit, Mich., 225; Cincinnati Traction Co., Ohio, 50; Montreal Street Railway, 400; British Columbia Elec. Ry., 30; Calgary Street Railway, 18; Metropolitan Street Ry., Kansas City, Mo., 50; Edmonton Radial Ry., 4; San Antonio Traction Co., San Antonio, Tex., 6; Rockford & Int. Ry., Rockford, Ill.; Cairo Street Ry. & Lt. System, 6; Des Moines City Railway, Iowa, 12; Macon Ry. & Lt. Co., Macon, Ga.; Virginia Ry. & Power Co.; Columbia Elec. St. Ry. & Lt. & Power Co., Columbia, S.C.; Aurora, Elgin & Chicago Ry., Chicago, Ill.; Wichita Falls Traction Co., Wichita Falls, Tex.; Ottawa Electric Ry. Co., Ottawa; Bloomington & Normal Ry. & Lt. Co., Bloomington, Ill.; Corsicana Transit Co., Corsicana, Tex.; Compania Electrica y de Ferrocarriles, Mexico; The Milwaukee Elec. Ry. & Lt. Co., Milwaukee, Wis.; Springfield Street Ry. Co., Springfield, Mass.; Lynchburg Traction Co., Lynchburg, Va.; Chicago & Southern Traction Co., Chicago, Ill.; Calumet & South Chicago Ry. Co., Chicago, Ill.

THE LESSON

taught by this widespread use of Pay-As-You-Enter Cars is obvious. Increased Revenue, Accident Elimination and Schedule Improvement have been demonstrated in every case. Isn't all this sufficient to show that it always pays to operate the Pay-As-You-Enter Car? Why not remodel some of your present cars?

We license manufacturers and railways to build and use the Pay-As-You-Enter Car, the Patents on which are owned by

THE PAY-AS-YOU-ENTER CAR CORPORATION.

Ferranti

TRACTION METERS

The demand for Car Meters has grown very rapidly and the economies effected by the installation of these instruments have more than justified their use.

The guaranteed accuracy of the Ferranti Traction Meter is $2\frac{1}{2}$ per cent. from full load to 1-10th load.

Will stand 100 per cent. overload for ten minutes.

Interesting data and attractive prices furnished on application to

Canadian Representative

G. C. ROYCE,
West Toronto, Ont.

YOU Need This Railroad Library

—a library that will give you the best up-to-date modern practice. There is no other reference

work in the world that so completely meets the needs of the railroad man as the INTERNATIONAL RAILROAD LIBRARY. This is an epitome of the years of experience of the best railroad experts in the country edited in a style that 18 years of experience in publishing home-study textbooks has proved the easiest to learn, to remember, and to apply. The volumes of this library are a part of a series of textbooks that cost \$1,500,000 to prepare. They are recommended by the highest authorities and are used in nearly all our leading universities and colleges. Not only can they be used to great advantage by superintendents, railroad officials, foremen, engineers, firemen, conductors, and brakemen as an authoritative guide in their work, but since they can be so clearly understood even by persons having no knowledge of higher mathematics, they can be used by all classes of railroad employees that are desirous of advancing to higher positions. Write for catalog now.

INTERNATIONAL TEXTBOOK COMPANY

Box 1072, Scranton, Pa.

DOUBLE BOILER CHECK VALVE

The position of this valve is on top of the boiler. It is provided with a top valve for each check valve, so that either one of the check valves, if out of order, may be "cut out" without interfering with the feeding of the boiler. Removable caps on top of each check permit inspection and grinding of valves without disconnecting pipes. Simple and pleasing design, compact and efficient. Furnished complete with boiler flange.

BOOTH WATER SOFTENERS**What You Should Know**

- (1) Boiler Maintenance—
One \$10,000 softener saved \$250 per month—30 per cent. on investment.
- (2) Saving in Fuel—
One \$1,500 softener saved \$4,888 yearly in coal—over 300 per cent. on investment. Another softener reduced fuel consumption 20 per cent.
- (3) Washing Out Boilers—
Stationary boilers washed out once in 168 days; before using softener, once in 7 days.
- (4) Cost of Purifying Water
The average cost is from one to three cents per 1,000 gallons, depending on hardness of water.

We have data on softeners in operation to prove these and other conclusive statements.

"A man never catches up with his
good intentions for to-morrow."—
Poor Richard, Jr.

Send today for our
book about the

**EDISON
BSCO
PRIMARY BATTERY**

The Edison BSCO was the first "unit" construction zinc plate copper oxide battery made. The present type of Edison BSCO for railway signal purposes represents a long progressive step in the field of railway signal battery construction and is as far in advance of the early type of Edison Battery as that battery was in advance of other batteries of its time.

Reliability in the highest degree possible is the first thing you require of a battery. You can't afford to accept a less degree of reliability than the Edison BSCO affords—and you get the highest degree of reliability in this.

When you consider, in addition, the low operating and maintenance cost, and that the slight difference in first cost between the Edison BSCO and other batteries is more than covered by the *50 per cent saving in labor cost alone*, isn't the Edison BSCO the battery for you?

Our booklet covers the subject. Write for it to-day—every railway signal engineer and purchasing agent should have it.

Thomas A. Edison, Inc.
51 Lakeside Ave., Orange, N. J., U. S. A.

Chilled Iron Wheels of Increased Mileage

Wheels made of iron purified by Titanium Alloy do not develop chipped flanges, broken rims, cracked plates and seams along the throat of the flange. The metal is denser, tougher and more free from brittleness than ordinary chilled iron.

TITANIUM

The Wonder-Working Alloy

gives at least 20 per cent. longer life to wheels. Leading railways and wheel manufacturers use and endorse Titanium Alloy. Its use increases cost to user about 10c per 100 lbs. of wheels. It also betters quality of steel wheels.

Booklet No. 30 will certainly
interest you. Send for it.

Eliminate Losses From Fire Blockades

The O-B Emergency Fire Hose Bridge will make it possible for you to run your heaviest cars over several lines of fire hose and save the fares lost by blockades during fires along your line.

It can be carried on your repair wagon and set in position on track very quickly.

Fares lost by a single blockade during rush hours would equip your entire system. Better be prepared.

THE OHIO BRASS CO., Mansfield, Ohio, U.S.A.

CHRISTMAS APPEAL

FOR

The Hospital for Sick Children

Dear Mr. Editor,—

Thanks for your kindness in allowing me the privilege of appearing at this Christmas time on behalf of the Hospital for Sick Children Toronto.

I make this direct appeal to the people of Ontario, for the fathers and mothers of Ontario, outside the City of Toronto, have precisely the same claim for their sick children as regards the privileges of the Hospital, as parents who reside in this city.

In brief the sick children from any place in Ontario whose parents cannot afford to pay, is, on certificate from a municipal officer of any city, town, village or township, treated free.

This is a privilege not granted by any Hospital in the Dominion, or on this Continent.

Let me, in a few words, state that in the last 20 years, since 1891, there have been 4,731 patients from 450 places outside of this city treated free, as the parents were unable to pay for treatment. Last year 384 patients from 234 places outside Toronto were so treated.

The Hospital is not a city but a Provincial institution. The Corporation of Toronto grants \$18,000, not only for city children, but towards the maintenance of every patient in the Hospital, and the citizens of Toronto donate an average of \$10,000 to the maintenance fund of the Hospital.

It would take more space than you can spare to tell of the good work done for the sick and deformed children of this Province.

Why, in the Orthopedic department in 20 years, nearly 700 children, boys and girls, have been treated for club feet, and about 600 were corrected. Two-thirds of these came from places outside of Toronto, from parents who could not afford to pay.

Surely we have a fair claim for help from the people of this Province.

Every day is Christmas to the child whose little life is saved, or whose crippled limb is straightened with the might of money—your money—and the mercy of the Hospital.

Will you, the reader of this letter, think of what your dollar will do? It helps to restore health and strength, and give sound limbs and straight feet to crippled boys and girls.

You give wealth to the Hospital, and the Hospital gives health to the children.

Yes, your money can put golden hinges on the door of the Hospital's mercy.

Will you, kind reader, help us and send a spare dollar to Douglas Davidson, the secretary-treasurer of the Hospital, or

J ROSS ROBERTSON,
Chairman of the Trustees, Toronto

Steel Castings

One of the two largest steel castings ever made in Canada was cast by us. They were Y-pipe connections for a 10,500 H.P. water wheel. We made it for the John McDougall Caledonian Iron Works, and they were thoroughly satisfied.

Absolute Satisfaction is

The Bradstreet Company gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

PROFESSIONAL CARDS.

THE RAILWAY AND MARINE WORLD is especially adapted for the publication of professional cards of engineers, inspectors, analysts, electrical experts, naval, grain elevator and other architects, solicitors, etc., who desire to bring themselves under the notice of the management and officials of the various steam and electric railway, steamship, grain elevator, telegraph, telephone and power companies throughout Canada, as well as the locomotive, car and ship-builders, contractors and promoters of railway enterprises. THE RAILWAY AND MARINE WORLD is the only medium through which all these important classes can be reached.

Rates will be quoted on application.

ACTON BURROWS, LIMITED - - 70 BOND ST., TORONTO

CANADIAN PACIFIC RAILWAY CO.**Issue of New Ordinary Capital Stock.**

NOTICE is hereby given that, pursuant to Resolution passed at the Special General Meeting of Shareholders on 7th October, 1908, an issue of \$18,000,000 additional Ordinary Capital Stock of the Company, or 180,000 shares of \$100 each, has been ordered by the Board of Directors.

The said Stock will be offered to the Shareholders of record at 3 p.m. on Tuesday, the 2nd day of January, 1912, at the price of one hundred and fifty dollars per share, being at a premium of Fifty per cent. over and above the par value thereof, on the basis of 10 per cent. or one share in ten of their respective holdings.

The right to subscribe will expire at 3 p.m. on Tuesday, 13th February, 1912. Payments will be received at the Bank of Montreal, London, New York, or Montreal, as follows:—

20%, or \$30 per share on subscription on or before 13th February, 1912.

20%, or \$30 per share on 12th April, 1912.

20%, or \$30 per share on 14th June, 1912.

20%, or \$30 per share on 16th August, 1912.

20%, or \$30 per share on 18th October, 1912.

Interest at the rate of 7% per annum will be paid in October, 1912, from the due date of each instalment to September 30th, 1912, on instalments up to and including that of 16th August, 1912, which have been paid on or before due dates.

All shares of the issue on which instalments have been paid in full on the due dates will rank with the existing stock for the full dividend accruing for the quarter ending 31st December, 1912.

A circular containing the terms of subscription and payment, and enclosing warrants of subscription, will be mailed to the Shareholders on or about the 15th day of January, 1912.

By order of the Board,

W. R. BAKER,
Secretary.

Dated at Montreal, 13th December, 1911.

"BROWNHOIST" LOCOMOTIVE CRANES

"Brownhoist" Crane Coaling Engine on N. Y., N. H. & H. R. R. from cars on side track.

A RAPID AND ECONOMICAL METHOD of handling coal from car to engine or from car to coal tipple. The crane coals the engine while it is being cleaned on the ashpit. It cleans the pit, placing the ashes into the car. Many roads use the crane to fill the pockets on their coal chutes. Time and money are saved on both of these methods of coaling an engine.

ON CONSTRUCTION WORK the crane is a labor saver. The crane excavates, drives piling with a pile-driver, handles construction material of all kinds, switches the cars, places heavy steel structures, and does all the lifting and moving of material.

AROUND THE SHOP AND YARD the crane handles ALL material. It can be equipped with either grab bucket, bottom block, or lifting magnet. Either one is easily and quickly applied.

"Brownhoist" Cranes are built for hard and continuous service.

Westinghouse Air Compressors

THESE compressors may be used for any service, outdoors or in, operate automatically, require no special attention, and cost little to maintain.

In design and construction they are simple, compact, self-contained, easy to handle and install, and exceptionally reliable in operation under the extreme conditions met with in outside work.

For operating riveters, pneumatic tools of all kinds, rock drills on steam shovels, sand blast, paint-spraying machines, and for industrial use these compressors are unsurpassed. Catalogue No. 9012 gives full particulars.

ATLANTIC STEAM SHOVELS

CLASSY 45-16 $\frac{1}{2}$ ATLANTIC SHOVEL

ECONOMY IN OPERATION

Reduction in friction and boiler losses, with corresponding increase in pull at dipper, is the reason why the Atlantic shovel digs more at less cost than shovels of the chain type.

Wire rope hoist, found only in the Atlantic, exerts a direct pull on the dipper and substitutes friction of a rope with but one large sheave for that of a chain with from four to six additional small sheaves. The less power lost in the machine itself, the more you have left for digging.

Further economy in operation is secured by using a large boiler of the locomotive type, in which more of the heat is utilized and less is lost up the stack. This is possible only because of the removal of the hoisting engines from their usual position on the car body, to the boom.

The placing of the main hoisting engines at the foot of the boom reduces the power necessary for swinging the boom and removes the twist upon the car body when working on one side. With this construction the turntable centre and boom foot constitute the engine frame. One casting takes the place of four or more in the usual construction, reducing the total weight of the shovel, and the weight on the front trucks.

Spare parts are kept on hand at our Works at Longue Pointe, Montreal, Canada. Every part is made to gauges, and sure to fit.

The Great Advantage of an "AMERICAN" RAILROAD DERRICK

over any form of fixed arm crane is that the radius being variable, a load which may be reached at a long radius by lowering the boom, can be placed on a car at a close radius by elevating the boom while the load is suspended.

This is Important and should be Considered

Cut shows a 20 ton "American" Railroad Steel Stiff Leg, Derrick installed at Portland, Ore., for the Spokane, Seattle & Northern Ry., for transferring heavy commodities.

"Dominion" Wire Rope

"The Rope of Quality."

The Quality of a wire rope depends upon the class of wire used in its construction and the way this wire is stranded together. All our ropes are made from the best quality of imported wire, specially drawn to our own specifications. Our years of experience enables us to specially prepare wire ropes for every possible rope condition, which will give the very best results and will suit the most severe tests.

**Wire Rope of every description for Elevators,
Mines, Coal Hoists, Ore Hoists, Conveyors,
Derricks, Steam Shovels, Dredges, Logging,
Ballast Unloaders, Etc.**

We have all sizes in stock, supplied in all lengths. Special rope made to order.

The Automatic System of Signals is the Standard of America

Automatic Signals prevent collisions, increase track capacity and delay double tracking single track lines. They are not only a good insurance, but a good investment.

The Hall Signal Company manufactures exclusively automatic signal apparatus, and its reputation is based on the quality of the apparatus produced. The Company is prepared to furnish plans and estimates for signaling any section of track, however simple or complicated, and takes this opportunity to offer the services of its engineers to the Railroads of Canada.

Fairbanks Track Scales

A HIGH GRADE INVESTMENT

FOR ACCURACY AND SERVICE

Valuable information that vitally concerns every manufacturer, can be obtained by the use of Fairbanks Track Scales.

You should have absolute evidence of delivery of quantity as well as quality and there is no reason why you cannot secure it by the proper use of our Scales.

In our Suspension Platform Track Scales the shock is absorbed in the suspension bearings, and the Type Registering Beam absolutely eliminates all possibility of error in reading the weight. They meet the most exacting demands for a modern weighing machine.

KINGSTON, - - - - - ONTARIO

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	-	-	-	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	-	-	-	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	-	-	-	9.40 p.m.	Daily.
Leave North Toronto	-	-	-	10.00 p.m.	Will Stop at Westmount.

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ¶ The roadbed has been improved till it is unexcelled in Canada.
- ¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

MODERN DESIGNS FOR MOTOR CONNECTION

The Only Satisfactory Test of a File
is Actual Use

Mechanics are particular and will continue to use a make of file they have found to give the best results. The Nicholson File Company adopted and adhered to the policy of making the best file possible.

The result of this policy is that their business has increased from 100 dozen a day sold in a local market in 1864 to 16,000 dozen a day sold all over the world, and Nicholson-made Files are recognized as the standard wherever files are used.

Dearborn Treatment Overcomes All Bad Water Troubles

Because Scientifically Prepared to Suit Water Conditions

Boiler troubles such as scale, leaking, corrosion, priming and foaming, are caused by mineral salts in the water, and can be overcome only by the use of proper reagents for these salts. To this end the waters along the line must be analyzed, and specific treatment applied accordingly.

Gallon samples of the waters are required for analysis. When reports are completed, we are ready to prepare treatment, and will send an expert engineer to instruct in the proper handling of the material.

THE COMPANY OFFERS FOR SALE

Farming and Grazing Lands in Manitoba and the Northwest Territories

ON EASY TERMS OF PAYMENT

Town Lots for Sale at Winnipeg, Ft. William, Edmonton, Prince Albert, etc.

The Company has General Stores at Winnipeg, Vancouver, Calgary, Edmonton, and other places where purchasers will find the best of goods at moderate prices.

Transportation by the Company's Steamers, brigades of boats and canoes throughout the Territories not traversed by railways.

Full information at the Company's Offices, Winnipeg, or 1 Lime St., London, E.C.

For Railroad and Steamboat

The Corbet Roller Bearing Truck

IS USED BY

The Canadian Pacific Railway

And Other Large Companies

This truck has many **SPECIAL** features over the old style, and is made Strong and Heavy, to withstand the abuse to which it is subject.

The Roller Bearings reduce friction to a minimum, thereby **Doubling the Life of the Truck.**

Purchasing Agents will consult their own interests by having this **Truck** in their Freight Sheds.

The Railway and Marine World

February, 1912.

The National Transcontinental Railway Shops at Transcona.

Progress in the construction of the N.T.R. shops at Transcona has been noted in *The Railway and Marine World* as the work advanced. These descriptions in the various stages of completion were published in Aug., 1909, Aug. and Sept., 1910, and July, 1911. A number of changes, some of which involved considerable rearrangement, have from time to time been made so that the completed scheme, more particularly as it relates to the car department, is materially different from that at first outlined. In view of these changes, and the fact that the shops are now nearing completion, a complete illustrated article describing them in detail has been prepared.

These shops, located at Transcona, some six miles east of Winnipeg, on the

chanical Engineer and Machinery Expert, and has since then had entire control of the completion of the locomotive shops and construction of the car shops, together with the selection and location of machinery and equipment placed in the locomotive shops, and to be placed in the car shops, and also of all mechanical equipment along the N.T.R. line. D. A. Evans, who is one of his assistants at Winnipeg, has done very good work in connection with the locomotive shop plant.

As above stated, the original purpose of the shops is to provide for repairs for the N.T.R. east of Winnipeg, which line on completion will be operated by the Grand Trunk Pacific Ry. Co. They will also be used for repairs for G.T.P.R. lines west of Winnipeg, though later on

would be capable of a further extension of 100% when traffic conditions should require it.

The various buildings are arranged along a midway running north and south across the property, and are served by a series of standard gauge and industrial tracks. The standard gauges branch off from the yard tracks to the south of the property. Additional communication between the buildings is obtained through the overhead travelling crane shown in fig. 1, which runs the whole length of the midway, serving all the main shops. This crane has 10 tons capacity, and is electrically operated, all exposed parts being covered by hoods in the usual manner. The operator's cage is electrically heated with a heater of the street car type. The runway is of

Fig. 1. Isometric Projection of Locomotive and Car Departments. (Copyright.)

N.T.R. main line, are intended to look after the general repairs of 1,800 miles of road, and have been designed with that object in view. In conjunction with the shops to be constructed at Quebec, the whole line from Winnipeg east to Moncton, will be provided for. An idea of their extent may be gained from fig. 1, an isometric scale projection of the shops. It is said that next to the C.P.R. Angus shops at Montreal, they will be the largest in Canada.

The details of the locomotive shop plant were partially developed and constructed under the supervision of F. W. Walker, M.E., Superintendent of Terminal Shops, N.T.R., who, however, resigned on July 1, 1911. W. J. Press, M.E., was, in May, 1910, appointed Me-

chanical Engineer and Machinery Expert, and has since then had entire control of the completion of the locomotive shops and construction of the car shops, together with the selection and location of machinery and equipment placed in the locomotive shops, and to be placed in the car shops, and also of all mechanical equipment along the N.T.R. line.

The site chosen is the prairie, and in order to avoid any trouble from flooding during the spring freshets, the floor level of the shops has been raised about 4 ft. above that of the existing prairie by a heavy gravel fill over the whole area occupied by the buildings.

The various buildings have been grouped together as closely as possible to facilitate intercommunication during the severe winter, the intervening distances being made as short as possible. As will be noted from fig. 1, this feature has been carried out very successfully, considering the fact that the designers had in mind the building of a plant that

steel construction, the steel columns supporting the girders being carried on concrete piers. Wherever possible, this runway is made a part of the adjoining building, dispensing with columns at these points.

As indicated in fig. 1, the car shops are to the north, and the locomotive shops to the south, the midway passing through each group of buildings. The divisional line is the through track running to the north of the power house, the latter being as centrally located as is feasible to reduce power and heat transmission losses to a minimum. The foundry and forge shops, being used by both departments are also centrally located between the groupings, the buildings that are distinctively car or loco-

motive being at the north and south ends of the midway respectively.

The buildings, with the exception of the storehouse, oil house and stores platform, are of steel construction with self-supporting steel frames, with concrete foundations and walls up to the windows. The balance of the superstructure masonry is brick, carried up into a parapet wall all around the building, and capped with a concrete coping. The roof drainage is carried down inside the buildings from receiving hoppers in the roof and through running traps to the sewers. All the large buildings are covered with a built-up roofing composed of felt and asphalt covered with gravel. All windows throughout the plant have $\frac{1}{4}$ -in. thick ribbed glass, and the skylights are glazed with $\frac{3}{8}$ -in. wire glass. As additional protection against heavy snow loads on the roof, the skylights are carried on steel ribs with rolled copper sheathing to carry the glass. Copper is used

distributed throughout the various buildings with numerous outlets. The piping distribution system is carried up and down the midway from the power house in a tunnel of sufficient size to permit a passage alongside the pipes, and branches to the various buildings are run from this tunnel in tile conduits packed with asbestos sponge. On entering the building, the piping is carried on the trusses and steel work of the shop. Fuel oil is distributed under pressure from the storage tanks to the furnaces in the boiler, locomotive and forge shops, while an accumulator gives the necessary pressure for the operation of the various hydraulic machines.

The shops are protected from fire by an extensive system of yard piping and fire hydrants, with hose houses at convenient spots. The electric travelling cranes throughout the plant are equipped with alternating-current motors, and are operated directly from the 3-

places, and also has valves for steam, water and air, each pit being a completely equipped unit in itself. A wall bracket crane between every alternate column is also provided. Between each pit there is the usual work bench fitted with the necessary equipment.

The next span is a 60-ft. bay containing all the heavier individual motor-driven machine tools where the bulkier and heaviest parts are handled. This is provided for by two 10-ton cranes for the handling of materials.

At the extreme left of this bay the flue shop is located adjoining the boiler shop contained in an extension to the locomotive shop, and which will be later described. The equipment of this shop is thorough, containing the following machines. (The first column refers to the index number on the illustration by which the machine can be located):

112 Chain rumbler with cleaning chain attachment.

138 Cold cutting-off machine.

Fig. 2. Plan of Locomotive Machine Shop and Gallery, and

throughout for all flushing gutters and ventilators. The completed shops will have a total floor space of a little over 17 acres.

Mercury arc lights are being used for the principal interior shop illumination, with the lamps and reflectors hung high in the shop. This form of illumination is satisfactory, giving an easy, even light with no sharp shadows. In addition, there will be plug receptacles in all the buildings at frequent intervals for the attachment of lamps on cables for the illumination of boiler interiors and similarly hampered places. Daylight illumination is especially well provided for by ample window areas and wide skylights, giving the maximum of light. The steel-construction makes this possible. To utilize this lighting to the greatest advantage, the interiors of all the shops are painted white, so that the lighting is particularly good.

High and low pressure steam, water, compressed air and drinking water, are

phase circuits from the power house.

Locomotive Department.

THE LOCOMOTIVE, MACHINE AND ERECTING Shop, a plan view of which is given in the double-page illustration, fig. 2, is 615 ft. long, containing three bays. The main bay, which is 70 ft. wide, with a height to bottom of truss chord of 50 ft., is the section shown in the lower part of the illustration. It contains 25 locomotive pits. There are two entrances to these pits, at the sixth pit from each end. The locomotive, when entered, is picked up by a 120-ton electric crane which spans the 70-ft. bay, carrying the locomotive to the desired berth. This arrangement has certain advantages over the transfer table, and long track erecting floor layouts. A 10-ton electric crane of similar span used for general work, handles the majority of the parts.

Each pit is replete with plug connections for electric light cables for dark

138A Pipe machine.

139 Flue expander.

140 Flue welder and swedger.

141 Hot saw and expander.

142 Cut-off machine.

Staybolt nipper.

Pneumatic staybolt breaker.

The stationary machines of this lot are in a group drive, with the exception of 112, which has an individual motor. (Motor drive will hereafter be designated by "m.d." unless otherwise noted).

The wheel department, which is next in order in this bay, is provided with all the necessary equipment, including the following machines:

113 32-in. Draw-cut shaper with crane.

113A 12-in. Slotter.

There is also a large steel tire floor centrally located, with a lye vat of sufficient size that driving wheels, side rods, and similar parts may be completely immersed for cleaning off the grease.

Next in order comes the wheel department. In this section there are the following motor-driven tools:

- 114 60-in. Planer.
- 115 24-in. Slotter.
- 116 96-in. Boring mill.
- 117 Extension gap lathe.
- 119 600-ton Hydraulic wheel press.
- 120 90-in. Driving wheel lathe.
- 121 85-in. Quartering machine.
- 122 80-in. Wheel lathe.
- 134 60-in. Radial drill.

To the right of this section comes the balance of the heavy motor-driven machines, classed as a general department, with the following machine tools:

- 125 60-in. Planer.
- 126 60-in. Planer.
- 128 26-in. Draw cut shaper with crane.
- 129 30-in. Draw cut shaper with crane.
- 130 72-in. Vertical boring mill.
- 131 42-in. Vertical boring mill.

- 5 14-in. Bolt lathe.
 - 6 16-in. Shaper.
 - 7 60-in. Radial drill.
 - 8 32-in. Engine lathe.
 - 9 30-in. Engine lathe.
 - 10 Horizontal boring mill.
 - 11 50-ton Forcing press.
 - 12 52-in. Vertical boring machine.
 - 12A 42-in. Vertical boring machine.
- The piston, crosshead and motion department, which comes next in order, is very complete with a wide range of standard tools for this class of work. The 26 machines in this set have group drive divided into two sections with the heavier machines at the left end of the section in one drive. The complete list is as follows:
- 13 36-in. Planer.
 - 13A Piston grinder.
 - 14 Double emery wheel.
 - 15 36-in. Radial drill.
 - 16 16-in. Bolt lathe with taper attachment.
 - 17 66-in. Radial drill.

- 36 18-in. Engine lathe with taper attachments.

Alongside this section is the tool room in a closed partition. It has the usual tool room equipment for a shop of this size, as follows:

- 37 Grindstone.
- 38 16-in. Universal shaper.
- 39 14-in. Tool lathe with taper and relieving attachments.
- 40 6-spindle Drill.
- 41 2-spindle Drill.
- 42 18-in. Tool lathe with taper attachments.
- 43 14-in. Tool lathe with taper attachment and draw-in collets.
- 44 Twist drill grinder.
- 45 Reamer grinder with attachments.
- 46 Tool grinder.
- 46A 12-in. Speed lathe.
- 47 22-in. Engine lathe with taper attachments.
- 48 Milling machine.

An air compressor, electrically operated, in a compartment alongside the

Boiler and Tank Shop, showing Tool Layout in all Shops.

- 127 Combined milling machine.
 - 132 18-in. Slotter.
 - 118 6-ft. Radial drill.
 - 137 26-in. Draw cut shaper with crane.
 - 136 18-in. Vertical miller.
 - 136A Locomotive rod boring machine.
 - 133 60-in. Draw cut cylinder planer.
 - 135 Special cylinder borer.
 - 123 36 x 36-in. Milling machine.
- Along the north side of the shop there is a third bay 40 ft. wide, extending the full length, with a gallery overhead. On the ground floor under the gallery the lighter group-driven machinery is placed as will be described. Commencing at the left, omitting for the present 178, a hydraulic rivetter, there is first of all a general department consisting of the following smaller machine tools, belted to a jackshaft driven from two motors:
- 1 26-in. Engine lathe.
 - 2 28-in. Engine lathe.
 - 3 Double emery grinder.
 - 4 26-in., 12-ft. Bed engine lathe.
 - 18 48-in. Radial drill.
 - 19 50-ton Forcing press.
 - 20 16-in. Engine lathe with taper attachment.
 - 21 Centreing machine.
 - 22 Milling machine.
 - 23 18-in. Emery grinder.
 - 24 Disc grinder.
 - 24A Link grinder.
 - 25 16-in. Traverse shaper.
 - 26 10-in. Slotter.
 - 27 20-in. Engine lathe with taper attachment.
 - 28 16-in. Engine lathe with taper attachment.
 - 29 20-in. Planer.
 - 30 14-in. Drill.
 - 31 4-in. Hack saw.
 - 32 Buffing machine.
 - 33 Universal grinder with all attachments.
 - 34 16-in. Engine lathe with taper attachments.
 - 35 16-in. Engine lathe with taper attachments.

tool room, in conjunction with the air compressor at the right hand end of the middle bay, supplies all the air required in this shop, thus making it independent of the central plant air compressor in the powerhouse. Moreover, standing connections are provided, connected with the general air distribution for use in case of emergency.

Just past the tool and air compressor rooms is the bolt department, equipped with the machines enumerated:

- 49 3-in. x 36-in. Hollow hex. turret lathe.
- 50 3-in. x 36-in. Hollow hex. turret lathe.
- 51 4-in. Hack saw.
- 52 4-in. Hack saw.
- 53 2-in. x 24-in. Hollow hex turret lathe.
- 54 Automatic lathe.
- 55 Centering machine.
- 56 14-in. Bolt lathe with taper attachment.

handle the standard sizes of plates and shapes used in boiler and tank practice. This studied arrangement is especially apparent around the group of machines 144, 143 and 162, where standard boiler plates may be readily flanged, rolled, punched or sheared without interference.

In addition to the equipment enumerated in the foregoing for both locomotive and boiler shops, there is considerable equipment of a miscellaneous nature. This includes such items as 6 each of 50, 40, 35 and 25-ton jacks, 90 bench vises, 18 heavy trucks, taps, dies, etc., chisels, pinch bars, sledges, box wrenches, surface blocks and oil burners.

THE FORGE SHOP is the first building south of the locomotive shop building as indicated in fig. 1. The interior arrangement of the tools and machines in this building is clearly shown in fig. 3. It is 260 by 100 ft., spanned by a single truss providing unhampered space for the location of the equipment.

The front of the building is to the left in fig. 3. On entering, the spring department is to the right in the southwest corner of the building. It is equipped to handle spring work for both locomotive and car departments, and has the following machines:

F43 Hydraulic squeezer.

Their locations are indicated in the illustration. F35 is a hydraulic bulldozer, with accompanying furnace, and F39 is a 3½-in. forging machine. The balance of large equipment is:

F38 Cutting-off and centering machine.

F42 Emery grinder.

F41 1½-in. Bolt machine.

F40 Hydraulic bar shear.

The balance of the floor space is for the storage of stock, dies, etc.

A small industrial track with necessary turntables, covers the building. At the front there is a foreman's office, while in a small two-story addition from the south side are the locker and toilet rooms.

The steam to the hammers, exhaust, oil and hydraulic piping are carried in concrete ducts through the shop to the various machines. The building is heated by indirect radiation from coils along the walls under the windows.

FORGE STORES AND SCRAP BINS are housed in a frame structure 30 by 220 ft., extending to the rear of the forge shop. The east 100 ft., i.e., the section furthest to the rear, is built with a roofed platform raised 4 ft. above the grades for the convenient handling of material to and from cars. This platform is divided

T2 12-in. Railway frog slotter.
T3 Cold cut-off saw.
T4 14-in. Double emery.
T8 Frog and switch planer (m.d.)
T12 Rail bender for rails up to 100 lbs. (m.d.)
T11 Bulldozer with crane (m.d.)
T5 200-lb. Strap hammer with crane.
T7 125-lb. Strap hammer with crane.
T9 25-in. Throat punch and shears

(m.d.)
T15 36-in. Planer (m.d.)
T13 36-in. Radial drill (m.d.)
T14 36-in. Radial drill (m.d.)
T24 Cut-off saw (m.d.)
T23 3-spdl. Drill (m.d.)
T22 36-in. Planer (m.d.)
T21 Milling machine.
T16 16-in. Shaper.
T17 14-in. Bolt lathe.
T18 18-in. Engine lathe with taper attachments.

T20 6 x 36-in. Grindstone.

T19 24-in. Drill.

In addition to this equipment there is the usual miscellaneous material, including blower and motor, anvils and stands, sledges, set of blacksmith's tools, forges and furnaces.

The toilet and locker room is located in the southeast corner of the building, surrounded by an 8-ft. cement wall re-

Fig. 4. Plan and Tool Layout of Frog and Track Shop.

Fig. 5. Plan and Tool Layout of Locomotive Carpenter and Pattern Shop.

F44 Hydraulic spring bander.
F45 Hydraulic punch.
F46 Hydraulic band remover.
F47 Combined nipper and trimmer.
F48 Tapering rolls.

The necessary furnaces, baths and racks are also provided as noted, and the whole is conveniently arranged. Ample floor space is provided to the north for the storage of the raw and finished product.

Further down the shop on the same side, there is a row of 13 double forges set at an angle as dictated by good practice. Adjacent to these is a row of six hammers, as follows:

F27 200-lb. Hammer.
F28 1250-lb. Hammer.
F29 1500-lb. Hammer.
F30 3000-lb. Hammer.
F31 3300-lb. Hammer.
F32 200-lb. Hammer.

It is here that the medium weight work is handled. In this section of the shop there is also a frame fire and necessary face plate, as well as these two machines:

F36 Vertical hydraulic shear.
F37 Alligator shear (m.d.)

The north side of the shop cares for the heavy work at the rear, where the following two machines:

F34 3500-lb. Hammer.
F34 5000-lb. Hammer.

with accompanying furnaces handle the heavier billets. All the steam hammers and large fires are provided with jib cranes for the handling of the work.

into bins for sorting and storage of scrap. The section not raised is completely enclosed with plank lining inside and drop siding outside, and forms storage for coke, coal and iron stock. The iron stockroom is arranged with an extensive rack system for storing the different stock sizes for use in the forge shop. The coal and coke storage bins are arranged with roof hatches in order that cars may be unloaded by a clam shell and crane from the car and the coal or coke dropped through the roof. Industrial tracks connecting with those in the forge shop provide easy access for the entrance of materials and supplies.

FROG AND TRACK SHOP.—This department is located in a building some distance to the rear of the forge stores and scrap bins. The building is 60 by 100 ft., with a 24-ft. clearance between floor and truss, and is spanned by a 10-ton electric travelling crane for the handling of the work. The shop was designed having in view the looking after of all repairs to frogs, switches, interlocking plants, and general track machine work. Fig. 4 shows the layout.

All the heavier motor-driven equipment occupies the body of the building, while the lighter, group-driven machinery is ranged along the walls. The whole is served by a continuation of the industrial trackage before referred to, with necessary turntables for spur tracks. The machinery equipment is as follows:

T1 18-in. Double head traverse shaper.

inforced by expanded metal, thus allowing the crane to pass over it. The shop floor as in the other shops is formed of 3-in. wood spiked to sleepers bedded in bituminous concrete. Direct radiation from coils ranged along the walls is used to heat this building, owing to its comparatively small size.

THE CRUDE OIL STORAGE building is a 25 by 60 ft. concrete structure close beside the frog and track shop, and owing to the nature of its contents, is built mostly underground, the floor being 8 ft. below the grade, with the side walls projecting only 2½ ft. above the ground. A concrete roof carried on steel beams closes in the building, making it thoroughly fireproof.

Inside, on concrete foundations, there are four iron storage tanks, each with a capacity of about 8,000 gals. of crude oil. Compressed air connections are made to these tanks and the oil is forced out and distributed to the various buildings requiring it.

The tanks are so arranged that the pressure can be cut off and the tanks filled by gravity from tank cars standing on sidings alongside the building. Piping connections to the outside of the building, fitted with lock-up valves, are supplied for this purpose.

THE STORE HOUSE building is located at the southern end of the midway, directly across from the locomotive erecting shop. It consists of a large reinforced concrete platform 4 ft. above grade in order to have car and platform on the

elevated steel platform, are also in the cupola room. The core ovens are fired from this room also, keeping all the ash, etc., in one place. The loaded cars after weighing are raised by a 2-ton pneumatic elevator to the charging floor and are here handled by a couple of pneumatic charging machines, one for each cupola. The charging floor has a steel plate floor, and is laid out with a transfer truck and storage tracks for keeping loaded cars on hand ready for charging while the cupolas are running.

The 30-ft. bay on the south side of the building has a small brass foundry at its west end, enclosed by expanded metal screens 10 ft. high. There are 4 brass furnaces 26 ins. diameter, and one 32 ins. diameter, located in the corner of the building. This small foundry is equipped with regular brass foundry equipment, including tongs, shank, core-maker's bench, chipper's bench, band saw, spine cutter, 2 tumblers, 20 by 32 ins. and 24 by 36 ins. respectively, emery grinder and moulding machine. It is served with a one-ton crane.

The iron foundry has the following additional equipment: 20 charging trucks, 6 coke boxes, 10 steel frame yard trucks, 36 x 60 in., cinder mill, 4 tumbling barrels, 36 x 48 in., 2 emery grinders, exhaust system from tumblers and grinders, core wire straightener, 2 chipper's benches, 4 core-maker's benches, hammer core machine, 2 sand sifters, 6 18 by 18 by 36-in. water tanks, 20,000, 10,000 and 4,000-lb. geared ladles, 3 1,800-lb. truck ladles, 20 250-lb., 10 150-lb., and 20 60-lb. ladle bowls, brake shoe moulding machine, 8 moulding tubs, 90 moulding flasks in 4 sizes, 18 sets of moulding tools and a gravity moulding machine.

The cleaning room is at right angles to the main building, and is spanned by a 5-ton electric travelling crane. In this annex are located the tumblers, grinders, etc., and a service track runs through the room for the loading of cleaned castings right on to the cars for shipment.

The moulding sand is stored in bins on the south side, filled from cars on the service track and distributed by industrial tracks inside the building. Along the north side of the building, between the service track and the foundry, as shown in fig. 6, there is a long galvanized iron shed, roofed in and divided into separate compartments. Here are stored direct from the cars, the coke, pig and scrap iron under cover, and these are brought into the foundry on cars running on industrial tracks, also under cover between the bins and the building. Having both material and handling tracks under cover is a valuable feature in all winter weather.

THE MOTIVE POWER OFFICE is south of the locomotive erecting shop and opposite the storehouse. It is a brick structure with steel interior frame, 60 by 68 ft., consisting of two stories and a basement.

The basement is devoted to a large testing laboratory, lavatories and storage. The ground floor has offices for the department's officials and clerks, and on the first floor are the draughting room, file room, and blueprinting room. A vault is carried up from the basement to roof with vaults on each floor.

The floors are of maple on spruce joists carried on the walls and steel work. The interior is plastered throughout and the halls and stairs have a wood wainscoting. The building is heated by direct radiation coils and has incandescent electric lighting fixtures.

The Canadian Northern Ry. reports a total wheat haul for 1911, of 38,750,000 bush., an increase of about 14,000,000 over the previous year. About 8,000,000 bushels are still in elevators along the line.

Birthdays of Transportation Men in February.

Many happy returns of the day to:—

S. A. Baker, Canadian Freight and Passenger Agent, Chicago Great Western Rd., Toronto, born at Morrisburg, Ont., Feb. 1, 1877.

B. H. Bennett, General Agent, Chicago and North Western Ry., Toronto, born at Cobourg, Ont., Feb. 6, 1858.

F. L. C. Bond, Resident Engineer, G.T.R., Montreal, born there Feb. 21, 1877.

T. Britt, General Fuel Agent, C.P.R., Montreal, born there Feb. 3, 1871.

F. W. Churchill, C.P.R. ticket agent, Collingwood, Ont., born in London, Eng., Feb. 6, 1853.

H. R. Charlton, General Advertising Agent, G.T.R., and G.T.P.R., Montreal, born at St. Johns, Que., Feb. 9, 1866.

F. W. Cooper, Resident Engineer, C.P.R., Montreal, born at London, Ont., Feb. 16, 1880.

R. Crawford, Northwest Agent, Northern Navigation Co., Winnipeg, Man., born at Kingston, Ont., Feb. 21, 1870.

R. W. Drew, Division Freight Agent, Kootenay and Boundary Divisions, C.P.R., Nelson, B.C., born at Kingston, Ont., Feb. 17, 1874.

E. A. Evans, ex-General Manager and Chief Engineer, Quebec Ry., Light and Power Co., Quebec, born at Kensington, London, England, Feb. 26, 1855.

E. H. Fitzhugh, President, Central Vermont Ry., Southern New England, Ry., and Montreal and Southern Counties Ry., Montreal, born in Montgomery county, Mo., Feb. 1, 1853.

L. O. Genest, General Storekeeper, C.P.R. Western Lines, Winnipeg, born at St. Henri, Levis County, Que., Feb. 16, 1856.

T. C. Hudson, Master Mechanic, C.N.Q.R. and Q. & L. St. J. Ry., Joliette, Que., born at Brockville, Ont., Feb. 20, 1873.

W. Jackson, C.P.R. ticket agent, Clinton, Ont., born there Feb. 4, 1860.

C. Gardiner Johnson, Lloyds' Agent for British Columbia, Vancouver, B.C., born at Dumblane, Perthshire, Scotland, Feb. 8, 1857.

R. S. Logan, Vice President, G.T.R., Montreal, born at St. Louis, Mo., Feb. 13, 1864.

G. L. McCrea, Local Freight Agent, C.P.R., Vancouver, B.C., born at Springtown, Ont., Feb. 9, 1876.

D. MacPherson, Assistant to Chairman, National Transcontinental Ry. Commission, Ottawa, born at Bath, Ont., Feb. 2, 1858.

T. McNabb, Master Mechanic, Alberta Ry. and Irrigation Co., Lethbridge, Alta., born in Scotland, Feb. 16, 1849.

J. K. McNeillie, Superintendent, District 1, C.P.R., Farnham, Que., born at Toronto, Feb. 23, 1874.

D. C. Macdonald, Division Freight Agent, C.P.R., Regina, Sask., born at Elmsdale, N.S., Feb. 9, 1874.

C. S. Maharg, Superintendent, C.P.R., Calgary, Alta., born in Dufferin County, Ont., Feb. 4, 1867.

G. A. Montgomery, Superintendent, Algoma Central and Hudson Bay Ry., and Algoma Eastern Ry., Sault Ste. Marie, Ont., born at Bradford, Ont., Feb. 11, 1871.

A. Z. Mullins, Commercial Agent, G.T.R., Grand Rapids, Mich., born at Appin, Ont., Feb. 14, 1862.

M. G. Murphy, District Passenger Agent, C.P.R., Toronto, born at Halifax, N.S., Feb. 26, 1878.

G. J. O'Dowd, City Freight Agent, C.P.R., Quebec, born at Montreal, Feb. 4, 1874.

J. E. Proctor, District Passenger Agent, C.P.R., Brandon, Man., born at Sarnia, Ont., Feb. 17, 1878.

A. H. Robinson, Superintendent, Elgin

and Havelock Ry., Havelock, N.B., born at Elgin, N.B., Feb. 2, 1862.

J. E. Robitaille, Accountant and Auditor, Ha Ha Bay Ry., Chicoutimi, Que., born at Quebec, Feb. 17, 1870.

A. E. Rosevear, Assistant General Freight Agent, G.T.R., Montreal, born Feb. 20, 1863.

H. H. Schaefer, Division Freight Agent, Intercolonial Ry., St. John, N.B., born at Cologne, Germany, Feb. 10, 1848.

J. G. Scott, ex-General Manager, Quebec and Lake St. John Ry., Quebec, born there Feb. 13, 1847.

G. Spencer, Superintendent, C.P.R., Sudbury, Ont., born in London, Eng., Feb. 21, 1865.

H. E. Suckling, Treasurer, C.P.R., Montreal, born at Gibraltar, Feb. 27, 1851.

Hugh Sutherland, Executive Agent, Canadian Northern Ry., Winnipeg, Man., born at New London, P.E.I., Feb. 22, 1845.

Sir Wm. C. VanHorne, K.C.M.G., director, C.P.R., and President, Cuba Co., Montreal, born in Will County, Ill., Feb. 3, 1843.

Superheating for Locomotives Instead of Electric Locomotives

The probability of the substitution of electricity for steam as a motive power for railways, on the score of reduced cost of operation, has been somewhat lessened by the extended application of superheat to locomotives. It now looks as though superheat will achieve those economies which, at least in practice on this continent, compounding has failed to secure. The simple engine always possessed certain practical advantages over the compound, and the addition of superheat makes it possible to secure equal and often greater fuel economy in a locomotive of the simple type, than is possible in a non-superheat compound. The increasing application of superheat may easily be set down as the most important development in locomotive practice of the past year. In spite of predictions to the contrary, the weight and size of Canadian and United States locomotives, and, to a less degree, of foreign locomotives, continue to increase. To-day, in the huge engines built for the Santa Fe Ry., surely the limit has been reached. A passenger locomotive for hauling fast passenger trains weighs 188 tons without the tender. The Santa Fe Mallet freight locomotive, with 24 wheels, 20 of which are drivers, weighs 308 tons, and with the tender, 425 tons, its length over all being 120½ ft.

Canadian Steel.—Experiments made at McGill University by J. W. Evans, of Belleville, Ont., reported in Machinery, have apparently demonstrated that the titaniferous iron ore which abounds in Ontario and Quebec can be converted directly into steel by the electric process, and thus made commercially valuable. Tool steel of a superior quality can, it is said, be produced at a cost of about 2 cts. per lb. One experiment was made with a ½-ton electric furnace, into which 230 lbs. of ore was placed and from which 110 lbs. of steel was produced. The steel was poured directly into moulds and cast into lathe and planer tool shapes, which were ready for use after being hardened, tempered and ground.

The Board of Railway Commissioners will, at its sittings in Ottawa, Feb. 6, consider the matter of requiring all railway companies subject to its jurisdiction to equip their locomotives with dump ash pans, or other appliance, to avoid the necessity of enginemen or others going underneath to clean them.

Mechanical Methods and Devices.

Planer Clamp for Switch Points at the Canadian Steel Foundries' Plant.

The two accompanying illustrations show a very handy planer clamp used at the Canadian Steel Foundries' Montreal plant, R. Nickle, Master Mechanic, for such work as planing switch points and

Fig. 1. Mechanism of Planer Clamp for Switch Points.

rails in general. By its use it is possible for the operator to loosen, remove and set up another pair of points ready for planing in five minutes or less.

Referring to figs. 1 and 2, which are similarly lettered, there is a threaded wheel A, bearing against a stationary

Small Bench Heater at the C.P.R. Angus Shops.

A simple little bench heater using gas is employed at the C.P.R. Angus Shops for heating soldering irons and small parts. The general arrangement is shown in the accompanying illustration.

A bent steel plate A of required form, bolted to the work bench, carries a couple of fire bricks B laid flat upon it, with two more bricks C standing on edge forming a combustion chamber. Mixed gas and air enter this chamber from each side through bent tubes D, on to

Recessing Tool at G.T.R. Point St. Charles Shops.

Babbitt, when used as the lining metal for locomotive eccentric straps, is held in place in the sheave by projecting prongs of babbitt run into holes in the inner face of the strap itself, as all shopmen know. To form the necessary holding recess in the babbitt hole, a neat little tool is used in the locomotive machine shop of the G.T.R. Point St. Charles Shops, Montreal, over which J. Lees is General Foreman.

This tool, shown sectioned in fig. 1 and standing to the left on the jig in fig. 2, consists essentially of a taper-shank body A, pinned in a slot in the end of which are two cutters of form B free to swing radially outward. Their normal position is such that the points fall within the outer surface of the body leaving no projecting edges. The points are of the required shape to give the fan required to the babbitt-holding recess.

A pin of shape C, free to move within limits set by a set screw in the body A fitting into a slot in the side of the shank of C, is held normally in its outer position by a coiled wire spring D in the body of the holder.

Fig. 2. Planer Clamp for Holding Switch Points.

plate B, bolted to the planer table. A square-threaded bolt C, on which wheel A works, is pin-connected on the other side of plate B to a central bar D passing along midway between the two rails on the table. This bar is guided by enclosed ways E. The central bar D has notched sides, and bearing in these recesses there are short struts F, which when central bar D is drawn back by the hand wheel A, are forced outward against the rail on each side, holding it securely against formed pieces and bolted to the planer table in the proper location to give the requisite taper to the rail edge. These outer holding blocks are so shaped as to fit closely around the rail base, so that when pressed outward against these blocks no further holding down pressure is required.

To replace rails, the hand wheel A is released, loosening struts F, which are removed, allowing the rails to be swung up out of their places. As previously mentioned, very rapid setting up is possible. Not only that, but the device acts essentially as a jig, producing duplicate work with but little care on the part of the operator after the first one has been properly located.

The Goderich Elevator and Transit Co., Goderich, Ont., handled 7,250,000 bush. of grain during 1911, against about 4,550,000 bush. in 1910.

which plates E are slipped, concentrating the heat in a small intense zone. In or over this flame the soldering iron or article to be heated is placed as shown.

Air entering through, and regulated by, valve F, and gas through and controlled by valve G, mix at H. The

Small Bench Heater for Shop Use.

The hole to be recessed is first drilled the required depth with an ordinary drill, which is then removed, and the recessing tool introduced in its place. On being lowered into the hole (which is the same size as the body of this tool), the pin C strikes the bottom, and

Fig. 1. Tool for Recessing Babbitt Holes In Eccentric Straps.

proper proportions may be simply obtained by the regulating valves.

The Union Pacific Rd. has presented to the engineering section of the McGill University, Montreal, a working model of the electrically operated automatic block signal in use on its lines.

During Nov., 1911, eleven employees were killed and 23 were injured in the course of their work in connection with steam railways in Canada. Of the fatalities, three were due to being run over, two each to collisions, to crushing, to falling material and to being struck by locomotives.

being prevented from proceeding further, forces out the cutters B on its tapered face, as the body continues to lower, the cutting action being thus purely radial.

The jig and process used for this operation are rather interesting, and are shown in fig. 2. The jig, consisting of a square body with a circular movable plate thereon, is bolted to the side of a radial drill table as indicated. To the movable plate the strap to be drilled and recessed is attached and secured thereto by a clamp. Into the strap a drill jig is placed. In the hole to be drilled and recessed a drill bushing is

slipped, and the movable plate swung around until a level, placed on the face of the drill bushing, indicates that the latter is level. The whole device is securely clamped in this position and the operations proceeded with. Each hole

Fig. 2. Jig for Holding Eccentric Straps while Recessing Babbit Holes.

is separately levelled up, drilled and recessed in this manner.

Pneumatic Sledge for Heavy Cutting.

Where there is very much heavy cutting, such as severing staybolts in the firebox side sheets, etc., the employment of a couple of men with sledge hammers proves a slow and expensive means of accomplishing the desired end. To meet the demand for a better method, a heavy pneumatic sledge of the construction shown herewith, was designed and built at the New York Central Lines Beech Grove shops.

The construction of the main portion of the device is very similar to that followed in standard pneumatic chipping

valves. The chamber serves as a reservoir to fill up rapidly the space behind the piston, so that the latter has full air pressure acting on it. Thus, when the valve G is opened by raising lever H, the cylinder has the large reservoir to draw upon, reducing the pressure fluctuations due to the intermittent action of the hammer; this would be large if the supply pipe led directly to the cylinder.

The piston hammer is raised by means of the by-pass pipe-connection I leading

Grinding in Ball Joints.

from the air hose to the bottom of the cylinder, controlled by valve J. In service the operator first raises lever G, which impels the piston hammer. At the end of its stroke, this lever G is returned to its normal position and valve J opened, thereby raising the hammer. This is the cycle of operation. To relieve the air pressure in the cylinder ends after the respective strokes, a $\frac{3}{8}$ -in. hole is provided near each head through which the pressure quickly dissipates.

the fingers B.

When not in use, the fingers B fit into the grooves in washer C. When ready to be used, the whole device is slipped down inside the ball joint to be ground in, the fingers B lifted out of their slots,

Babbitting Journal Brasses.

and the washer given a slight turn, the fingers dropping back in place on the outer surface of the washer. Screwing up the nut forces the fingers outward against the inner surface of ball joint, gripping it securely.

To release, the operation is reversed. The nut is loosened, washers twisted around until the fingers fall into the slots, and the device is then readily removed. The slots save a lot of lengthwise movement of the nut.

Babbitting Journal Brasses at the Central Vermont Ry. Shops.

An excellent method of babbitting journal brasses is in use at the Central Vermont Ry. shops at St. Albans, Vt.,

Pneumatic Sledge for Heavy Cutting.

and rivetting hammers being made up of a cylinder A in which there is a hardened steel piston B, the latter made a sliding fit in the cylinder. This cylinder body is made of a piece of $4\frac{1}{2}$ -in. hydraulic pipe, 4 ft. in length, bored to a $3\frac{1}{2}$ -in. diameter. Attached to the lower end is the head C, which holds the operating chisel. Air entering at the top gives the piston plunger its impetus, and air introduced below the hammer raises it for the next stroke.

The manner of controlling the air is interesting and unique. Attached to the upper end of the cylinder there is a chamber D of relatively large size. A direct connection to this chamber is given from the air hose nipple at E through pipe F, with no intervening

Grinding-in Ball Joints at the Intercolonial Ry. Moncton Shops.

The accompanying illustration shows a neat device for the holding of the ball joint while being ground-in to fit its seat. The device as shown is attached to a small air motor which revolves the ball joint at a good speed.

Consider the holding device. A collar A secured to the revolving shaft has three fingers B pinned to it, and free to swing outward. The shaft itself below collar A is threaded, and over this threaded section an unthreaded washer C fits, movable up or down by a nut D. The washer C has three equidistant slots about $\frac{1}{4}$ -in. deep, of the same width as

the method and the rig used being due to Alex. Tuscany, Foreman Moulder, who has charge of this work. The rig in which the actual babbitting is done is of particular interest.

The device used is shown in the accompanying illustration. A battery of four hollow cylinders A, are mounted on a base plate B. The cylinders have side pieces C bolted to them, against which the flat face of the journal brass is pressed. The journal brass is held in position while babbitting by an arm D, fulcrumed to the supporting table at the point E. A weight F, adjustable along the right-angle arm of the fulcrumed arm D, is secured by a set screw at a sufficient offset to maintain a pressure on the back of the brass at

controlled under this principle, in a very simple manner, very similar to the operation of the elevator in an ordinary office building, the motors being used for lowering, as well as hoisting the loads. The manual work which will come upon the operator of the machine will be very simple, enabling high speed operation. The coal being handled in large units and prevented at all points from dropping, will be broken

much less than with the ordinary grab bucket system. It is expected that this plant will very readily handle the large boats that are in use on the great lakes, in one day's time—10 hours.

To give an idea of the size and capacity of these machines it may be mentioned that the motor equipment on each of the unloaders will consist of a total of 550 h.p., and the bridge will have motors aggregating 700 h.p.

The unloaders will be built entirely of steel and weigh in the neighborhood of 600 tons each. There will be about 1,800 tons of bin and trestle system. The bridge will be approximately 800 tons. The most modern construction will be used in every detail.

The contract for furnishing the coal handling equipment has been given to the Wellman-Seaver-Morgan Co., Cleveland, Ohio.

The Canadian Pacific Railway Shops Near Calgary.

As officially announced in our last issue, the C.P.R. has let a contract for its western shops, which will be located on the main transcontinental line, about $4\frac{1}{2}$ miles east of the present shops at Calgary, Alta.

THE MAIN LOCOMOTIVE SHOP building will contain the erecting shop, machine shop, blacksmith shop and boiler shop. The erecting shop will be of the transverse lift-over type, and will contain 35 bays of 22 ft. each. Its entire area will be served by travelling electric cranes carried on two levels. It will be of structural steel frame on concrete foundations. The exterior walls up to window sills will be of concrete, and the walls, which are carried on steel members, will be of hollow tile, plastered. It will be heated by indirect fan system distributed by concrete and tile ducts.

TENDER AND WHEEL SHOP.—The de-

high speed travelling crane, which will handle all material to and from the cars and from the storage place that is provided between the storehouse and the erecting shop. The concrete foundations will be carried up to bring the floor of the storeroom to car door height, and the walls above will be either brick or hollow concrete blocks, supported on concrete foundation walls, the woodwork of heavy timber comprising slow burning mill construction. The building will be heated by an indirect fan system, and sprinklers will be installed for fire protection.

THE OIL HOUSE, 102 by 42 ft., will be similar in construction to the storehouse.

THE FOUNDRY will be 204 by 80 ft., of similar construction to the main building, having two bays, one of these of higher cross section to be served its en-

the foundry to storage or to the main shop, or loading for shipment.

THE PATTERN SHOP, 100 by 30 ft., for pattern storage and pattern making, will be of similar construction to storehouse.

THE COACH REPAIR AND PAINT SHOPS will be contained in one building 362 by 146 ft., having 15 tracks at 24 ft. centres. It will be of slow burning mill construction, having concrete block or hollow tile walls on concrete foundations. It will be heated with the indirect fan system distributed underground in concrete and tile ducts, and protected from fire by automatic sprinklers.

TRANSFER TABLE AND PITS.—For serving the coach shop there will be installed a 75 ft. transfer table of 150 tons capacity, equipped with an electric motor. The transfer pit and track foundations will be constructed of concrete.

General Location Plan, Canadian Pacific Railway Shops, near Calgary. (Copyright.)

partment for making repairs to locomotive tenders, steam shovels, lidgerwoods and other maintenance of way equipment will be contained in an L shaped building 80 by 340 ft., and will be equipped with a 20 ton high speed travelling electric crane having two 10 ton trolleys. There will be a depressed track carried along the ends of the wheel storage tracks outside, to facilitate unloading and loading wheels and axles. The building will be of structural steel frame, with steel roof trusses, and its general construction will be similar to the main locomotive shop.

THE STOREHOUSE AND OFFICE BUILDING will be 250 by 60 ft., two stories, with offices at one end three stories high. It will contain an electric elevator, vaults and platform scales. It will be parallel with the main building, the space between to be spanned by a

tire length with a high speed travelling electric crane. Jib cranes attached to building columns will be provided and so arranged that they may be moved from one location to the other if desired, handled by the travelling crane. In the side bay of lower cross section space will be provided for core making and snap moulding floor. The charging floors and cupola will be located in the centre of the low bay. The heating will be indirect fan system distributing through galvanized iron pipes carried overhead. Steam, air and water service, including fire protection and drinking water, will be provided. The location of this building, alongside yard crane, will enable the unloading of scrap and pig iron to be taken care of by the crane. This close proximity of the foundry to the crane will also reduce to the minimum the handling of the castings from

This pit will extend far enough at either end of the building to provide entrance and egress at both ends.

THE FREIGHT CAR REPAIR SHOP, 300 by 231 ft., is designed to contain eight repair tracks placed in pairs, giving room for an industrial material track between each pair of tracks. A brick wall will partition off a shop 50 ft. wide along one side, which will contain the blacksmith forges, woodworking and machine tools, the heating plant and foreman's office. The location of this building alongside of the lumber yard will permit of handling lumber so that it can be passed through into the shop without rehandling. An overhead trolley beam will be erected to permit of handling timbers with a trolley into the shop. Material bins will be located convenient to the building for storing material used on the cars repaired in the

shop. The building will be constructed with walls supported on concrete foundations having steel posts supporting steel trusses. The roof will be of the saw-toothed construction to afford good daylight lighting. The general construction of the building otherwise will be the same as that described for the other buildings, including fire sprinklers and indirect fan system for heating.

YARD CRANE.—The entire area, about 80 ft. wide, between the storehouse and the locomotive shop will be served by a high speed travelling crane of 10 tons capacity. The runway for this crane will extend for more than 1,200 ft., passing down alongside of the foundry and covering the space occupied by the scrap dock. One of the storehouse tracks will extend through under this crane, giving ample space for the storage of heavy material alongside of the storehouse, foundry and locomotive shop. By this arrangement heavy material will be unloaded, stored and rehandled to the shop or loaded out again for shipment by the crane, practically eliminating manual labor in the handling of all heavy material.

THE POWER HOUSE, 104 by 84 ft., will have sufficient space for boiler equipment necessary to provide steam for heating the shops, and for such other purposes as steam will be required throughout the shops. The building will have brick walls carried on concrete foundations, with steel roof trusses and supports for coal bunkers. The chimney will be of reinforced concrete or masonry. Overhead bunkers for coal will be provided and concrete dumping pit for unloading coal. An overhead storage bin for shavings will also be provided and another overhead storage bin for cinders, from which bin they can be discharged by gravity into cars alongside of the building.

THE PLANING MILL, 300 by 80 ft., will contain the wood-working machinery, having a track extending through longitudinally to permit of movement of material to the various machines, with the minimum amount of handling. The building will be located so as to be convenient to the coach shop and freight car shop. The lumber yard will be located back of and at one end of the planing mill. The building will be of hollow concrete blocks or hollow tile walls, carried on concrete foundations, with steel roof trusses covered with 4 in. plank sheathing. The heating will be the indirect fan system. Provision has been made for lavatories, metal lockers and suitable piping for distributing compressed air and water, including fire protection and drinking water.

THE MESS BUILDING will be about 150 by 30 ft., of one story, except a portion of the centre, which will be carried up two stories.

MISCELLANEOUS BUILDINGS.—Included in the scheme will be dry kiln, scrap docks, material bins, plate and iron racks, and other miscellaneous buildings in the yard, the details of which have not yet been gone into fully.

The cost of the shops will be about \$2,500,000.

We are indebted to J. G. Sullivan, M. Can. Soc. C.E., Chief Engineer, Western Lines, C.P.R., for the foregoing information.

Westinghouse, Church, Kerr and Co., New York, are the contractors.

The C.P.R. recently reported in connection with the eastern movement of grain, that in one day of 24 hours the number of cars of freight moved from Winnipeg eastward was 1,003, and the total number of cars moved to and from Winnipeg on all divisions during that day was 3,389. In the eastward movement, trains consisting of 45 cars were dispatched from Winnipeg at intervals of about an hour.

Large Railway Expenditures to Continue.

Sir Edmund Walker, President, Canadian Bank of Commerce, in his address to the shareholders at the annual meeting recently, said:—

"The extension of the three railways, the Canadian Pacific, the Canadian Northern and the Grand Trunk Pacific has been carried on to a greater extent than at any previous time and the disbursement of money in this connection has materially helped the prosperity of the western provinces. It is likely that these expenditures will continue for some years to come in order to meet the growing requirements of the country."

Approval of Route Plans of Railways Under Dominion Jurisdiction.

The following route plans have been approved by the Minister of Railways. The date of approval was Dec. 21, 1911, unless otherwise stated:—

ALBERTA CENTRAL RY.—Revision between Rocky Mountain House and Yellowhead Pass, about 82 miles.

From main line to Big Horn Coal Fields, about 27 miles.

ALGOMA CENTRAL AND HUDSON BAY RY.—From mileage 83.80 to National Transcontinental RY. (revision), 92 miles.

CANADIAN NORTHERN ONTARIO RY.—Ottawa-French River line, revision in counties of Pontiac and Renfrew, about 20 miles.

Sudbury-Port Arthur, revision in Algoma district, 18 miles.

Sudbury-Port Arthur, revision in Algoma and Thunder Bay districts, about 95 miles.

CANADIAN PACIFIC RY.—Wilkie-Anglia branch (revision), about 15 miles.

Swift Current, southeasterly, revision between mileage 40 and mileage 102.

Moosejaw southwesterly (revision), 29 miles.

Bassano easterly, 154.08 miles.

Revision of Manitou Lake branch, 48.9 miles.

Shepard to Medicine Hat, 186 miles.

Tantallon to Dysart, 113 miles.

CANADIAN NORTHERN RY.—Moose Jaw-Kindersley Extension further revision, about 132 miles.

Yorkton to Hudson Bay Jct., Sask. (revision), about 27 miles.

Strathcona to Camrose, Alta. (revision), about 9 miles.

Through tps. 1-3, ranges 3-28, w. 4th mer. (Alberta), about 170 miles.

Revision of Maryfield-Lethbridge line, about 240 miles.

Calgary to McLeod, Alta., thence westerly to Kootenay Pass, about 165 miles.

Underhill to Lampman, about 126 miles.

Craven to Yorkton, Sask., about 144 miles.

CANADIAN NORTHERN BRANCH LINES.—Craven towards Hudson Bay Jct., Sask., about 75 miles.

Tp. 23, r. 17 to tp. 29, r. 21, w. 3rd mer., Sask., 46 miles.

EDMONTON, DUNVEGAN AND B.C. RY.—Edmonton to Dunvegan, about 309 miles. approved Dec. 15, 1911.

ESQUIMALT AND NANAIMO RY.—Black Creek to Duncans Bay, about 25 miles.

GRAND TRUNK PACIFIC BRANCH LINES—Lazare to Edgely and Le Bret, about 144 miles.

Edson to Pacific Northern and Omineca RY. (revision), about 53 miles.

Calgary to Coutts, about 170 miles.

GRAND TRUNK PACIFIC RY.—Mountain Park coal branch, about 27 miles.

Moose Jaw, northwesterly (revision), about 7 miles.

Canora to Etoimami, about 90 miles.

PACIFIC AND PEACE RY.—From east of

Bella Coola and Dean Channel to Dunvegan, about 450 miles.

PACIFIC NORTHERN AND OMINECA RY.—From the 6th to the 8th meridian via Pine Pass, about 325 miles.

The St. John and Quebec Railway Contract.

The St. John and Quebec Ry. Co. has entered into a contract with the New Brunswick Government for the building of a railway between St. John and Grand Falls, N.B., practically following the valley of the St. John River all the way. This company was incorporated by the N.B. Legislature, at the same time as the legislation was passed providing that the province would guarantee up to \$25,000 a mile the bonds of any company entering into a contract to build the line. This guarantee was made conditional upon the building of a line to a certain standard, the obtaining of a grant under the usual terms from the Dominion Government, and the making of an agreement for the operation of the line as a part of the Intercolonial RY. system.

The surveys were made under the Provincial Government, and after considerable discussion a route was decided upon which will have a gradient of 0.4% going east and 0.6% going west, as between St. John and Fredericton, and not exceeding 1% between Fredericton and Grand Falls. To provide this gradient, however, it will be necessary to build three large bridges on the line, viz., over the St. John River near Grand Falls, on the lower reaches of the Mistake River, and across the Kennebecasis River at Perry's Point. The cost of these structures delayed the final completion of the arrangements until the Dominion Government agreed to provide the money necessary for their erection, in addition to the usual subsidy. The line will be about 210 miles long, and the final location surveys, prior to starting construction, are being made under the direction of Ross Thompson, Chief Engineer, whose headquarters are at Fredericton, N.B.

The contract for the building of the line was signed on behalf of the St. J. and Q. Ry. Co. by A. R. Gould, President, and J. M. Thomas, Secretary, who hold similar offices in the Aroostook Valley Rd., which has its offices at Presque Isle, Me., and are also associated with the Aroostook Falls power development project. The Aroostook Valley Rd. is at present in operation as an electric railway between Presque Isle and Washburn, Me., about nine miles. The company has a charter authorizing the purchase of the C.P.R. Aroostook branch and the extension of the existing line from Washburn to the western boundary of the State, a little over 80 miles. This route, as projected, passes a short distance south of Fish River Lake, crosses the Allegash River south of the falls, and proceeds by way of Umkaskers and Round Lakes to the International boundary in the vicinity of Frontier Lake. Here it is proposed to make connection with a line to be built from Quebec, which it is generally understood is the Quebec and St. John Ry., which was originally projected from Quebec to near Edmundston, and thence via the valley of the St. John River to St. John, but which subsequently had the route changed for one from Quebec to the International boundary. It is claimed that by the use of this combined route, the shortest possible line will be obtained between Quebec and St. John. (See St. John Valley Ry., Jan., pg. 23.)

The Kent Northern Ry., which runs from Kent Jct., on the Intercolonial Ry., to Richibucto, N.B., 27 miles, is said to have been sold to Toronto parties.

Transportation, from a Railway Superintendent's Viewpoint.

By U. E. Gillen, Superintendent, Middle Division, Grand Trunk Railway.

The word "transportation" is defined as the act of transporting, conveying or carrying something from one place to another. When a member of a railway club, or a person engaged in railway service, hears or thinks of the word transportation, he is apt to think, by reason of his association or employment, that it means the moving of passengers, mail or express, package or carload freight by a steam locomotive.

If he considers what mind conceived the idea, his thoughts revert to those whose genius has done so much for transportation, among others, Geo. Stephenson, who is credited with having invented the first successful steam locomotive in 1815; S. F. B. Morse, who invented the telegraph in 1835; Geo. Pullman, who invented the car bearing his name in 1863; Geo. Westinghouse, who invented the air brake in 1869; A. G. Bell, who invented the telephone in 1876; and if in Canada, he is also likely to think of the man at the head of each of the three leading railways of the Dominion, each of whom has done much in the way of providing good transportation facilities.

The transportation rules in use on the principal Canadian railways have been approved by the Board of Railway Commissioners. Each class of employes governed by those rules is required to commit to memory and write correctly the answer to each question in an examination book and pass a satisfactory oral examination before a competent rule instructor. In addition to the rules referred to a working timetable is provided for the government and information of employes only; it is the authority for the movement of regular trains subject to the approved rules, it contains the classified schedules of trains with special instructions relating thereto, and on single track designates trains in a certain direction, as indicated by timetable headings (unless otherwise specified) superior to trains of same or inferior class running in opposite direction.

The transportation department is the largest and perhaps the most important of the many departments on any large and well organized railway. We have evidence of this in our Government statistics, which show that, in 1910, the gross earnings of railways in Canada were \$173,956,217.13; operating expenses \$120,405,440.42. The latter amount is divided as follows:—

Transportation	48.94%
Way and structures.....	22.45%
Equipment	21.59%
Traffic expense	3.63%
General expense	3.39%

The principal transportation or operating officer usually has charge of maintenance and construction. This should be so, if for no other reason than that all work of maintenance and construction should be subservient to train movements.

The work of arranging train schedules, assigning car equipment, locomotives and men to the various trains, districts and terminals, the loading of locomotives over each district, in each direction, having due regard to the class of locomotives used, the weather conditions, the class of train to be handled, the maximum gradient over which the load is to be hauled; the shifting of locomotives and train crews from one terminal to another with a view to providing a locomotive and crew so that all regular trains can leave on time; also for extra trains as fast as enough cars accumulate for a full train or the business offered justifies the running of a

train short of full tonnage, and at the same time give men sufficient rest, eight hours out of every 24 and avoid keeping a man on duty more than 16 hours, or a locomotive, locomotive crew or train crew at a foreign terminal longer than necessary to make running repairs to locomotive and allow men sufficient rest, investigate the cause of any delay to a train which prevents it from making schedule time, investigate the cause of accidents of every description directly or indirectly due to, or connected with a locomotive or car movement in yard or road service (take immediate action, so far as it is possible to do so, to avoid similar delays and accidents), make wire and written reports to general officers regarding delays and accidents, examine new employes as to their qualifications, instruct employes in their duties, and assign them to their various positions. This is a part of the daily work

P248 U. E. Gillen,
Superintendent, Middle Division, Grand
Trunk Railway.

of a transportation or operating officer who is on the firing line, that is, the man whose jurisdiction is confined to one or more districts or a division, and the greatest degree of success cannot be obtained without system, supervision, organization and co-operation.

SYSTEM.—In order that the best use may be made of every locomotive, and that cars may be moved without unnecessary delay, it is important that some system be used to keep posted as to the location of every locomotive, the total number of loads and empties at each station to move, the direction they move and whether or not they are through cars or local cars.

The different classes of service can be provided most economically and satisfactorily if a certain type of locomotive is assigned to a certain train or service, it is, therefore, obvious that much care must be exercised in the assigning of locomotives, and in order to properly assign or provide a locomotive you must readily recognize its class by the number and know the location of

every locomotive at any hour of the day or night.

Different methods have been adopted by different officials for obtaining the necessary information about locomotives and cars. The method or system which the writer is most familiar with and regards as most satisfactory and complete, provides for a careful check and record of each locomotive twice daily. The report is compiled in the train dispatcher's office and shows the number of every locomotive recorded on train sheet that is on the road at the time report is compiled, and the terminal to which the locomotive is destined. In addition to this a report is received from each locomotive foreman on the division, giving the numbers of all locomotives at his terminal, the numbers of all locomotives available or for which order has been accepted, the numbers of locomotives in yard, transfer and pilot service, the numbers of locomotives crippled that will be out of service more than 12 hours, and the numbers of locomotives under repair that will be available for service within 12 hours. The numbers thus collected, plus those in big shop, will correspond with total assignment. At the same hour information is collected from locomotive foreman about locomotives, the general yardmasters at all terminals and the agent at principal junction points and stations make a report of the number of loads and empties on hand to move and their destinations. The information is transmitted by the use of symbols with the view of imparting the information by using the least number of telegraph characters.

Example:—"A" means all locomotives at the terminal.

"B" means all locomotives available or for which order has been accepted.

In compiling the report the sender would say "A" 1, 2, 3, 4, and 5, "B" 2 and 4, the figures indicating the numbers of the locomotives.

As to the time these reports should be compiled. I consider the best results can be obtained if reports show the conditions at 5 a.m. and 5 p.m. The train dispatcher, chief train dispatcher, trainmaster, superintendent, or anyone who is directly interested in, and responsible for moving cars and handling locomotives, is then in a position to know the situation immediately after coming on duty in the morning and shortly before leaving the office at night.

The car situation at the smaller telegraph stations is known by referring to the daily telegraphic car report, which shows the loads and empties on hand to move and the direction they move, the number and kind of loaded cars on hand to be unloaded, the number and kind of empty cars required for loading. The same information is obtained from non-telegraph stations by having the conductor of the wayfreight train in a specified direction wire the report from the first open telegraph office.

SUPERVISION.—No man, no matter in what capacity he is employed, whose duty it is to plan, direct, or supervise, should be burdened, as many are, with a class of work that could and should be done by a cheaper man.

ORGANIZATION of forces is highly essential, in order that a united effort may be made to accomplish the same result.

CO-OPERATION of the various departments means success for every department, which is most desirable.

The transportation department men should be, and I believe are, strong advocates of co-operation; they are dependent on the locomotive department for locomotives, and on the car department for cars; without engines and cars they are helpless.

The transportation department is charged with the responsibility for the

proper assigning and handling of locomotives and the moving of cars. Every locomotive and car out of service when needed increases the operating expenses, therefore, I think, the locomotive department should be assessed for every locomotive failure, also for every locomotive held out of service beyond a reasonable time. The car department should be assessed for every car breaking down in service, under fair usage, or held out of service beyond a reasonable time, and the amounts credited to the transportation department. I also think the fuel department should be assessed and the various departments credited with every item of expense directly or indirectly chargeable to poor coal. I say various departments, because I have known of serious damage to locomotives and cars resulting in interruptions to traffic, directly due to poor coal, and, perhaps, indirectly due to neglect on the part of certain employees under very extenuating circumstances.

The cost of operating is constantly increasing, due to increase in wages and increase in cost of materials used by railway companies. It has been said the increased expense is offset by the increased business. The facts are, according to the Railways and Canals Department report for a period of 12 years, 1899 to 1910, inclusive, the earnings per train mile increased 70.8%, and during the same period the cost of running a train one mile increased 80.8%. The average cost per train mile in 1899 was \$0.779; in 1910, \$1.409. In 1910 the average revenue per passenger per mile was 1.866 c.; this rate was .055 below the figures for 1909. The average revenue per ton per mile, which is accepted as representing the freight rate earned by all railways combined was .739 c.; this was .012 higher than the rate for 1909; it was also .067 lower than the rate for 1907. The aggregate passenger revenue for 1910 was \$46,018,879.56; the number of passengers handled was 35,894,575. The average revenue per passenger from ticket sales was \$1.282; revenue from freight amounted to \$116,229,894.06; tons hauled was 74,482,866. The freight handled is classified as follows:—Products of agriculture, 17.31%; products of animals, 3.71%; products of mines, 35.11%; products of forests, 17.54%; manufactures, 13.44% merchandise, 3.39%; miscellaneous, 9.50%. The same authority tells us that 12 roads showed net earnings amounting to \$52,041,937.00, or 97% of the total for all lines in Canada; also that 24 railways in Canada in 1910 showed a deficit or managed merely to make ends meet.

These figures and statements reflect and emphasize the necessity for economy. How railways can economize without impairing the service is worthy of our best thought. The cost per train per mile cannot be reduced under existing conditions; it will likely continue to increase; the average tons per car is 17.13; average cars per train 18.15; average tons per train 311. Can we not increase the load per car and cars per train, thereby reducing the number of cars in service and trains run, without detriment to the service? I believe we can, and as the majority of the lightly loaded cars are those containing package freight, l.c.l. shipments, usually handled by wayfreight trains, let us consider them first. It is not infrequent to see a wayfreight train start out of a terminal with l.c.l. shipments in half a dozen or more cars loaded at as many different places; the tonnage and shipments in those cars could probably be handled in about half the number of cars if the shipments were carefully loaded, and with the view of getting all shipments for the same place in one car and in the order in which the various stations are reached; it would save cars, overtime, loss and damage to

freight. The suggested reloading and transhipping should be done by the station staff at the terminal from which the wayfreight train starts.

Are the through lines not running more trains than necessary to properly handle the business, and if so, why? The average number of cars per train and average tons per train indicate that many locomotives are handling less than two-thirds of a load, and I believe the principal reason is, to move at a high rate of speed certain shipments that represent but a small percentage of the total tonnage handled.

All manifest trains are run at reduced tonnage, and on some through lines, so many manifest trains are run that it is seldom necessary to run a through dead freight train. Does the business warrant the railway companies in providing such expensive service, and do the consignor and consignee make the same effort to expedite the movement of such shipments? I think not. A recent check of 100 cars of fruit showed that the consignee used on an average more than five days per car in unloading, and a recent check showed that an average of more than seven days per car was used in unloading 100 cars of team track delivery freight, other than perishable shipments, calendar days counted in each case.

The yardmaster's idea is to get the cars out of his terminal with as little delay as possible, without due regard for the work necessary to get the train through the next terminal. In many cases time and money would be saved by holding cars at the first terminal 10 or 12 hours, or, if necessary, 24, to get enough cars for a through train, a train that would pass several terminal points without having to set out or pick up a car except to reduce or add to the tonnage of the train; the time lost at the initial terminal would frequently be more than offset by the saving effected in switching at several different terminals.

The present practice of not advising consignee about his shipment until it arrives at destination, and then allow him 24 hours to give placing order, causes delay to car and shipment; it also frequently results in heavy expense in switching movements that could be lessened or entirely avoided if cars for a given point were handled in train lots, the billing reference wired or telephoned to the agent at destination, and placing order obtained prior to the arrival of car.

The foregoing paper was read before the Canadian Railway Club in Montreal recently.

Branch Lines in the Maritime Provinces.—Hon. H. R. Emmerson, M.P., ex-Minister of Railways, brought before the House of Commons, Jan. 10, a resolution favoring the taking over such of the various branch lines now connected with the Intercolonial Ry. as would serve as direct and profitable feeders of the same. The Minister of Railways in a general way endorsed the principle of the resolution, and said: "The Government will be prepared to take them over after investigation to find out what branch lines on the I.R.C. can be taken over that will become feeders of that road, and not milkers of it. It will take them over on a fair and equitable basis."

Railway Lands Patented.—Letters patent were issued during Nov., 1911, in respect of the following railway lands in Manitoba, Saskatchewan, Alberta and British Columbia:—

	Acres.
Calgary and Edmonton Ry.	640.00
Canadian Pacific Ry.	19.54
Grand Trunk Pacific Ry.	46.89
Qu'Appelle, Long Lake and Saskatchewan Rd. and Steamboat Co.	1,286.00
Total	1,992.43

Canadian Northern Railway Earnings, Expenses, Etc.

Gross earnings, working expenses, net profits, increase or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Earnings.	Net Increase
July \$1,475,900	\$1,114,300	\$361,600	\$13,400
Aug. 1,420,600	1,105,900	314,700	51,700
Sept. 1,576,400	1,157,000	419,400	38,200
Oct. 2,028,900	1,348,500	680,400	99,900
Nov. 2,001,500	1,836,300	665,200	106,300
\$8,503,300	\$6,062,000	\$2,441,300	\$309,500
Inc. \$ 1,712,100	\$1,402,600	\$309,500	

Approximate earnings for December, \$1,831,400, against \$1,255,400 for Dec., 1910; approximate earnings for two weeks ended Jan. 14, \$530,600, against \$372,000 for same period 1910.

Canadian Pacific Railway Earnings, Expenses, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Profits.	Net Increase
July \$ 9,661,815.14	\$5,958,789.81	\$3,703,025.33	\$218,408.74
Aug. 10,121,904.42	6,346,338.41	4,075,571.01	338,898.68
Sept. 10,049,084.97	6,131,638.17	3,917,446.80	5,847.16
Oct. 11,207,991.99	6,626,887.24	4,581,104.75	175,944.23
Nov. 10,570,694.80	6,568,328.31	3,987,366.49	250,244.23
\$51,911,494.82	\$31,546,976.94	\$20,364,517.88	\$1,034,343.84
Inc. \$4,829,125.67	\$3,794,782.63	\$1,034,343.04	

Approximate earnings for December, \$10,568,000 against \$8,603,000 for Dec., 1910; approximate earnings for two weeks ended Jan. 14, \$2,951,000, against \$2,503,000 for same period 1911.

The mileage operated was increased during December to 10,832.

Grand Trunk Railway Earnings, Expenses, Etc.

The following figures show the earnings and expenses of the G.T.R., C.A.R., G.T. Western Ry. and D.G.H. & M.R. for Nov., 1911, as compared with those for Nov., 1910:—

GRAND TRUNK RAILWAY.		
	1911.	1910.
Earnings	\$3,152,800	\$2,989,500
Expenses	2,489,200	2,340,100

Net earnings\$ 663,600 \$ 649,400

CANADA ATLANTIC RAILWAY.		
	1911.	1910.
Gross earnings	\$ 188,100	\$ 176,700
Expenses	163,800	138,800

Net earnings\$ 24,300 \$ 37,900

GRAND TRUNK WESTERN RAILWAY.		
	1911.	1910.
Gross earnings	\$ 534,200	\$ 477,100
Expenses	424,600	427,800

Net earnings\$ 109,600 \$ 49,300

DETROIT, GRAND HAVEN AND MILWAUKEE RY.		
	1911.	1910.
Gross earnings	\$ 226,000	\$ 202,200
Expenses	160,000	136,000

Net earnings\$ 66,000 \$ 66,200

TRAFFIC RECEIPTS OF THE SYSTEM.

Aggregate from July 1 to Dec. 31:—

	1911.	1910.
Grand Trunk Ry.	\$4,133,320	\$3,696,455
Canada Atlantic Ry.	225,032	199,456
Grand Trunk Western Ry.	704,053	627,425
Detroit, Grand Haven and Milwaukee Ry.	252,834	218,388

Totals\$5,315,239 \$4,741,724

It has been decided, commencing with the January statement, to include in future monthly revenue statements, the balance of income from rentals, outside operations and hire of equipment, the balance of revenue from these sources having been previously shown in the half yearly accounts, but not included in the monthly revenue statements.

The Temiskaming and Northern Ontario Ry.'s Porcupine branch is reported completed to Schumacher, in the Pearl Lake district.

The Quebec and Saguenay Ry. is being sued by J. Slevin, for \$17,500 damages alleged to have been sustained through the railway running its line over his property without an agreement having been previously reached.

Rebuilding the C.P.R. Bridge over St. Lawrence River at Lachine.

The major portion of the new bridge being constructed across the St. Lawrence River at the Lachine rapids has been completed, and it is expected to finish the work in the coming summer.

Traffic on this portion of the line—the section from Montreal to Farnham on the main line to St. John, N.B., and Halifax—has increased tremendously, not alone due to the great expansions of the C.P.R., but also to the increased business handled by the St. Lawrence

The bridge is located at the upper end of the Lachine rapids, crossing between Lachine and the Indian village of Caughnawaga. At this point the current is quite rapid, running up to 8 and 10 miles an hour, even exceeding this in the spring when the ice floes come down. These difficulties were successfully overcome, work having been continuously pushed forward for more than a year, through the winter season. To facilitate work as much as possible the pier addi-

possible, around the old 240 ft. spans bridge, and the extension of the old piers in a similar manner as indicated in fig. 2. The building of the piers in deep water is shown in fig. 4.

A different method of building the piers was followed in the deeper water. A caisson was sunk at the outer point of the new section of pier, and from this outer stationary point, a coffer dam was built around to the existing position of the pier, work proceeding as before.

Fig. 1. The Old Bridge from the South Shore.

Fig. 2. New and Old Bridges from the Lachine Shore.

and Adirondack Ry. and the Rutland Rd., two units of the New York Central Lines, which also reach Montreal over this Lachine bridge. These conditions made it imperative to double-track the line from Montreal to Farnham if the traffic was to be handled expeditiously. This included double-tracking the bridge.

The old bridge, nearly three-quarters of a mile in length, was erected in 1886, a year after the completion of the transcontinental line, and was then considered a most remarkable feat in bridge-building. Webster's Dictionary cites it as an example of cantilever bridges, while an article in a magazine

tions were all made on the downstream side.

The original bridge had 17 spans from the Lachine end as follows: 3 shore girders 80 ft. long, 7 ft. deep; 8 river girders 240 ft. long, 35 ft. deep; franking span 270 ft. long; 2 cantilever spans 407 ft. long; franking span similar to the other side of cantilever, and 1 girder 240 ft. long, 35 ft. deep. It was decided to change the design to the extent of making the first four 240-ft. spans on the Lachine end into eight 120-ft. spans by building new abutments as shown in figs. 2 and 3, and by replacing the two cantilever spans by heavy girders. Building

The first steel work was done for the Lachine end, up to which point the line had been double-tracked, facilitating the removal of work train, crane, etc. A light truss of the form shown on the further track of the first span in fig. 3 was built across on the piers to be spanned. This formed a temporary supporting beam, on which the permanent beam was built up piecemeal. When completed, this temporary truss was taken out and moved to the next span. Construction work was carried on by a heavy travelling crane on the existing bridge. This procedure was followed until the eight 120-ft. spans were completed. Traf-

Fig. 3. Construction Work with Old Spans Removed.

Fig. 4. Pier Extension Work in Deep Water.

of 1888 describes it as "a remarkable structure, light, airy, graceful, with many interesting features." But, while sufficient to meet all requirements of that time, 26 years ago, rolling stock has increased in size so greatly during that period that the capacity of the bridge was not considered sufficient, resulting in its replacement entirely by a complete new double-track bridge of a heavier and more modern construction, designed by P. B. Motley, M. Can. Soc., C.E., Engineer of Bridges, C.P.R.

A little consideration will emphasize the big task undertaken in this project.

new piers at the Lachine end to shorten the spans was considered the best plan, for at that end of the bridge the water is shallow, the navigable section of the river being beneath the cantilever spans of fig. 1.

The plan adopted at the Lachine end for building the piers, was to drive piling around the place for the pier, forming a cofferdam, and after removing the water, to build up a concrete foundation to water level, on which the masonry was laid. This concrete foundation extends 18 ins. beyond each side. The new piers were built as complete as

fic was then diverted on to this new section of the bridge, a cross-over near the end of the new section carrying the tracks back to the old section not yet replaced. The old spans were then removed, a temporary span being also employed for this purpose. The piers up to this stage are shown in fig. 5.

An ingenious method of constructing and placing the new spans was adopted, the method being shown in fig. 6. Each girder of the span is built up separately on the piers, close alongside the existing span where it is easy to get at the parts while being built together.

On completion, by means of a block and tackle from the end of a projecting pole (fig. 6), the girder, supported on rollers, is rolled out to its location, and the inner girder built in the same location.

The Foundation Co. built the piers, and the Dominion Bridge Co. had the contract for the steel work. The latter company, having its construction works near by, needed no field shop. The Foundation Co., however, has quite an extensive shop on the south side of the river. As shown in fig. 1, there is a small industrial railway running out to the first water pier, supported on the

it was later adjourned to Jan. 22 to enable another petitioner's case to be heard. He believed that the original order was made under a misapprehension of the governing facts, and hoped that the outcome of the hearing would be that the Board had no intention to deprive the capital invested of a fair and reasonable return, having regard to the risks run, and to all the conditions pertaining to the construction, maintenance and operation of a railway in semi-arctic regions.

O. L. Dickeson, whose appointment as President, in succession to the late

The Railway to Hudson Bay.

The Dominion Parliament has voted \$1,166,666.66 on account of construction work on the railway from Pas Mission to Hudson Bay, a contract for the building of the first section of which has been let to the J. D. McArthur Co. Winnipeg.

J. D. McArthur, in an interview at Winnipeg recently, stated that there would be no disturbance of the contract he had for the building of the first section of 185 miles of the line

Fig. 5. New Spans and Uncompleted Piers, looking towards Lachine Side.

lower chord of the existing truss. On the Lachine end, there is a more elaborate system of staying out to the new piers, where more work was done. A couple of tugs and several scows were used for the carrying back and forth of materials for the isolated piers.

Work on the balance of the bridge, including the replacing of the cantilever spans, will be completed in the spring. All the work is being carried forward under J. H. Barber, M. Can. Soc. C.E., of the C.P.R.'s engineering department.

White Pass and Yukon Railway Company's Annual Meeting.

At the recent annual meeting of the company, in London, Eng., apology was made for the late date at which the meeting had been called, which was due to the hope that the proceedings regarding rate matters, now before the Board of Railway Commissioners, would have been concluded. The report showed that income tax was about £1,000 higher than in 1910, and that the dividends on shares in the local companies were about £8,000 less, and the profit for 1911 about £7,500 less than in the previous year. The sinking fund is now about £183,000, against £157,000 in 1910, the net profit being £40,871. Deducting from this, £18,285 for the sinking fund and £13,750, representing a dividend of 1% on the ordinary shares, there is a balance of £8,836, which is carried forward to the current year's accounts.

C. C. Macrae, Chairman, in referring to the rate question at present being dealt with by the Board of Railway Commissioners, said he thought it wise to say as little as possible while the matter was sub judice. The position was, that last spring the Board made an order, which, if enforced, would have had a serious effect on the local companies. Proceedings were taken to have the order reversed, and eventually an order for a re-hearing was granted. This was fixed to take place in November last, and took place on Dec. 6, after an adjournment in consequence of the death of the President, S. H. Graves, and

S. H. Graves, was announced by the Chairman, said that the gross earnings were down owing to the unsettled state of the Dawson market, due to the pending decision of the Board of Railway Commissioners on the question of rates, but although the gross earnings were lower, the net receipts had not decreased in the same ratio. By increasing the number of boats, the company had been enabled to carry all the tonnage to its destination, and it was encouraging to know that negotiations were under way, whereby the company expects to furnish oil fuel for dredge operations to take the place of the diminishing supply of wood.

C. C. Macrae and E. F. North were re-elected directors for the current year.

British Columbia's Railway Policy.

In an interview at Victoria, Jan. 8, Premier McBride is reported to have stated that the Government's railway policy would be announced in the course of a few weeks. This statement was made in reply to a deputation which waited upon the Government to urge the importance of building a line from Vancouver to the Peace River district, in support of which project public meetings have been held in Vancouver and other places in the province during the past three months.

The Legislature opened Jan. 11, and press dispatches state that the Government policy includes the building of a line to connect Vancouver with the northern parts of the province. The question whether the line will be built and operated by the Government has not been definitely settled, but as several companies already hold charters covering the territory, it is probable that the Government will build the line and arrange for its operation. It is reported that three firms have been negotiating with the Government for the building of the line. (See Vancouver and Peace River Ry., Jan., pg. 23.)

The Canada and Gulf Terminal Ry., R. Dupont, Traffic Manager, has been admitted to membership of the Eastern Canadian Passenger Association.

Fig. 6. Method of Locating Outer Girders of New Spans.

from Pas Mission. As the result of his interview with members of the Government, he would have a large force of men at work during the winter cutting out the right of way, and getting in supplies. In the spring the grading gangs would be sent out to begin the actual work of construction.

Work has been resumed by Mackenzie, Mann and Co. on the construction of the bridge across the Saskatchewan River at Pas Mission. The piers to carry the superstructure have been completed, and the plant and material for the steel spans were reported as being in transit, Dec. 30.

Speaking at Winnipeg, Dec. 29, the Minister of the Interior is reported to have said that the project would certainly be carried out.

J. D. McArthur had a further conference with the Minister of Railways, at Ottawa, Jan. 12, and the Minister stated in the House of Commons, Jan. 16, that he had under consideration an alternative route for the line. The Government had not yet ascertained whether Fort Churchill or Port Nelson was the better harbor on Hudson Bay, but in view of the urgency of the work and unanimity of opinion endorsing it, he had ordered construction to proceed. He believed, however, that another expedition would be necessary to definitely settle the harbor question. He had no doubt that the line could be built within two or three years. He had another project in view if the Hudson Straits were not found satisfactory for the running of boats. There would, he said, be two strings to the bow by establishing a line of boats from the port chosen across James Bay to the Nottaway River in Quebec, by which grain could be transferred to the National Transcontinental and shipments made from Atlantic ports. This, the Minister pointed out, would cut the haulage distance from Prince Albert and such points in the west by over 600 miles.

A deputation from Prince Albert, Sask., waited on the Government, Jan. 12, and asked for the building of a line from Prince Albert, Sask., to Split Lake, the terminal point of the section of the line under contract from Pas Mission. Consideration of the proposal was promised.

RAILWAY DEVELOPMENT.

Projected Lines, Surveys, Construction, Betterments, Etc.

Alberta Central Ry.—The Board of Railway Commissioners has approved location plans for the main line from mileage 100 to 140 west of Red Deer, Alta., and for the location of a branch from mileage 135 on the main line to the Big Horn Range coal fields, 28 miles.

We are officially advised that the Alberta Central Ry. has been taken over by the C.P.R.

The Alberta, Peace River and Eastern Ry. Co. is applying to the Dominion Parliament to extend the time within which it may build its projected railway. Grand and McCarthy, Ottawa, are solicitors for applicants. (July, 1910, pg. 547.)

Algoma Central and Hudson Bay Ry.—We are officially advised that during 1911 the company laid track on the extension of its line between Pangissin and Hobon, on the C.P.R. transcontinental line, as follows:—From mileage 81.6 to 99, a distance of 17.4 miles, and between mileage 115 and 153, a distance of 38 miles. It also completed the work on the branch line from Magpie Jct., on the Michipicoten division, to Magpie Mine, 9.42 miles; and laid about 10 miles of sidings, including yard track, at Sault Ste. Marie, Ont. The work on the main line to the C.P.R. transcontinental line is expected to be completed by August next. Progress is also being made on the extension of the line from Hobon, on the C.P.R., to the National Transcontinental Ry., 99.16 miles, and this work it is expected to have completed by Aug., 1913. The contractors are the Superior Construction Co., Espanola, Ont., the principals of which are T. J. Kennedy, Espanola, and J. D. McArthur, Winnipeg. A reconnaissance survey has been made for a further extension of the line from the National Transcontinental Ry. to Hudson Bay. (Jan., pg. 21.)

Bagotville and St. Lawrence Ry.—The Quebec Legislature is being asked to incorporate a company with this title to build a railway from Bagotville to Murray Bay or Baie St. Paul, Que., and from one or other of the two latter places by the most direct and advantageous route to Quebec. L. A. Cannon, Quebec, is solicitor for applicants.

British Columbia and Dawson Ry.—The company in an amended notice is asking the Dominion Parliament to extend the time within which it may build the lines authorized to be constructed by the act of incorporation of May, 1911, and to build three branch lines. The only variation from the previous notice is that the third line is to be from Vancouver to the main line at or near Lillooet. (Jan., pg. 21.)

British Pacific Coal Fields Co.—In connection with the development of the company's property on Graham Island, it is reported that a line of 1.5 miles will be built from the collieries to a deep water port. W. G. McMorris is Managing Director.

Bruce Mines and Algoma Ry.—Application is being made to the Ontario Legislature for authority to build a line from Rydal Bank station northerly and easterly to Hannah Bay, or other point on James Bay, Ont.; to build branch lines not exceeding 12 miles in length, and to extend the time within which the already authorized lines may be built. Lennox and Lennox, Toronto, are solicitors for the company. (July, 1911, pg. 645.)

Canada and Gulf Terminal Ry.—No new construction was undertaken during 1911. The company has under con-

sideration the extension of its line from Matane, the present terminus, to Gaspé Basin, Que., 189 miles, and from St. Flavie, the junction with the Intercolonial Ry., to St. Eleuthère, near the Quebec-Maine boundary. (June, 1911, pg. 505.)

Central Ry. of Canada.—A Montreal dispatch of Jan. 21 says:—"It is announced that preparations are complete for the building of this line, and that the first section from Montreal to Ottawa will be completed by the end of this year, while the further portion, from Ottawa to Georgian Bay, will be built shortly after. The company has changed its original plan, and the route, instead of passing through St. Benoit, will follow along the shore of the Lake of the Two Mountains, passing through St. Placide and Oka, crossing from the mainland to Ile Jesu at St. Eustache, and reaching the Island of Montreal at Cartierville. It will then parallel the Riviere des Prairies, crossing the C.P.R. tracks at Jacques Cartier Jct., and reaching the Harbor Commissioners' line on the waterfront at Tarte pier. This will be the freight entrance into the city. A passenger entrance is planned from the west, and it is expected that the terminus will be the G.T.R.

Churchill and Athabasca Ry.—Application is being made to the Dominion Parliament to incorporate a company with this title to build a railway from Fort Churchill, on Hudson Bay, westerly to Lake Athabasca, Alta. Bishop, Pratt and Delavault, Edmonton, Alta., are solicitors for applicants.

Dominion Atlantic Ry.—The Board of Railway Commissioners has approved revised location plans for the line from the west side of St. George St., Annapolis, N.S., to the west side of Allen's Creek, 2790.5 ft., and for the rebuilding of the bridge across Allen's Creek. (Dec., 1911, pg. 1137.)

Edmonton, Dunvegan and British Columbia Ry.—We are advised that the press reports that a contract had been let to G. H. Webster, Calgary, Alta., for the construction of the first section of this projected railway were premature, that the matter is not yet definitely settled, but that it is expected a decision will be reached early in Feb. T. Turnbull, Edmonton, Alta., is Chief Engineer. (Jan., pg. 21.)

Esquimalt and Nanaimo Ry.—The first through train over the extension to Port Alberni was run Dec. 20, R. Marpole, Vice President, taking a party of C.P.R. officials, including Vice President Bosworth, over the line.

The Board of Railway Commissioners has approved location plans for the extension projected from Black Creek to near Duncan's Bay.

Several conferences have been held between the railway, municipal and provincial authorities as to the disposal of the portion of the Songhees reserve, Victoria, which has been reserved for railway terminal purposes. The C.P.R. interests claimed to have premier rights, but the Premier said the matter must start anew. A union terminal is favored, and — Holman, who designed the terminals at Seattle, Wash., has been authorized to draw up plans for a union terminal. (Jan., pg. 29.)

Fraser River Bridge.—The Minister of Public Works for British Columbia, speaking at Vancouver recently, said the Government railway bridge over the Fraser River at New Westminster was spoken of as a "white elephant" when it was first built. But the traffic over it has increased so largely that the ques-

tion of building another bridge to accommodate the Great Northern Ry., and the other railways that were heading towards Vancouver, would have to be considered in the near future. Unfortunately the present bridge had been so planned that it would be impossible to add more trackage, consequently a new bridge would have to be built. (See Fraser River Bridge, Mar., 1911, pg. 207.)

Fredericton and Grand Lake Coal and Ry. Co.—A meeting of directors was held in Fredericton, N.B., Jan. 10. In an interview, Sir Thos. Tait is reported as having stated that the railway will be built this year. Local press reports state that tenders for the building of the line are under consideration, and that it is likely a contract will be let at an early date. Sir Thos. Tait is reported to have purchased outright or to have acquired a controlling interest in additional coal areas in the district to be served by the projected railway.

We are advised that Sir Thos. Tait has taken over the company's charter and has been elected President. (Dec., 1911, pg. 1137.)

Ha Ha Bay Ry.—We are officially advised that track was laid during 1911 on the main line from Riviere du Moulin bridge to Laterriere village, Que., 10 miles, and that the building of a branch line from Mathias Jct. to Jonquiere village, five miles is under consideration.

A press report states the company has under consideration a project for the building of a line from Mathias Jct., Chicoutimi to Roberval, Que., about 125 miles. There is a charter for the building of a railway under the title of the Roberval and Saguenay Ry., and the section of the Ha Ha Bay Ry., already built, would, with the projected Mathias Jct.-Roberval section, give the connection between Roberval and the Saguenay River. (Oct., 1911, pg. 935.)

High River, Saskatchewan and Hudson Bay Ry.—High River and Hudson Bay Ry.—At a meeting of the Saskatoon, Sask., Board of Trade, Jan. 2, reference was made to this projected railway. The route proposed is from an at present unsettled point on the western boundary of Alberta, near tp. 15, northeasterly to Saskatoon, and thence to Pas Mission, connecting there with the Dominion Government railway to Hudson Bay. (Jan., pg. 21.)

Hudson Bay, Peace River and Pacific Ry.—A special meeting of the shareholders was called to be held at the offices, 408 McArthur Building, Winnipeg, Jan. 22, for the purpose of authorizing the sale of a further block of stock. H. W. Adcock is Secretary. (Dec., 1911, pg. 1137, and Aug. 1911, pg. 733.)

Intercolonial Ry.—The Dominion Parliament has voted the following sums to be expended upon capital account:—

To increase accommodation	\$ 14,583.33
To strengthen bridges	26,250.00
Truro, N.S., increased accommodation	29,966.66
Mulgrave, N.S., improvements	17,500.00
Moncton, N.B., office building	28,291.66
Fredericton, N.B., improvements	10,500.00
Campbellton, N.B., improvements	15,750.00
Hampton, N.B., spur line	8,750.00
New Glasgow-Guysboro, N.S., line	583,333.33
Dartmouth-Dean Settlement, N.S., line	583,333.33
Alva-Baddeck, N.S., line	116,666.66

(Jan. pg. 21.)

Kettle Valley Lines.—Application is being made by the municipality of Penitction to the British Columbia Legislature for an act confirming a bylaw granting a bonus to the Kettle River Valley Ry., for building its line in and through the corporation limits.

J. J. Warren, President, on a recent visit to Victoria, B.C., is reported to have stated that 30 miles of line at the Merritt end had been completed, and that construction had so far progressed on other sections that it was expected to have the entire line built by the middle of 1913.

Surveys are being made for the location of the projected line from Vernon to Penticton. (Jan., pg. 22.)

The Iron Range Ry. Co. is applying to the Ontario Legislature for an extension of time within which it may build the lines authorized to be constructed by chap. 277 of the statutes of 1908. Dowler and Dowler, Fort William, Ont., are the solicitors. (April, 1910, pg. 271.)

Joliette and Lake Manuan Colonization Ry.—Press reports, Jan. 11, state that construction is being proceeded with on a section of the line between Joliette and Lake Manuan, Que., and that it is expected to have about 60 miles of track laid by the end of the year.

The company is said to be considering plans for the extension of the line southerly to Montreal, and it is stated that the line will cross the Back River and enter the city by a route entirely new among the city's railway connections. (Jan., pg. 22.)

London and Port Stanley Ry.—Speaking at the inaugural meeting of the London, Ont., city council, Jan. 8, the mayor said he had reason to know that an offer would shortly be made by a company for the electrification of the line. The prospective offer was a reason why the city should take up the question of studying the matter of controlling the road directly, and making it an up-to-date radial line.

The line is being operated under a lease by the Lake Erie and Detroit Ry., the Canadian end of the Pere Marquette Rd., which lease is about expiring. It is said that the Lake Erie Coal Co. is the company from which the proposition to electrify the line will come, and that it desires simply to have the right to haul coal trains over the line, leaving the city free to make such arrangements with other companies for the operation of passenger and general freight trains as may be desirable. (Dec., 1911, pg. 1139.)

Michigan Central Rd.—We are officially advised that the work going on at the locomotive house at St. Thomas, Ont., consists of an addition of 16 stalls to the 24 built in 1910. This will make a 40 stall house. The work is about completed. The building is of concrete and brick, 95 ft. in depth, with the stalls spread 14 ft. centres on the inner circle. (Jan., pg. 22.)

Minnesota and International Ry.—Press reports state that arrangements are being made for the purchase of the line from Funkley to Kelliher, Minn., owned by the Crookstown Lumber Co., and its extension from Kelliher to Winnipeg, Man. It is also reported that new and heavier steel is to be laid from Brainerd to Kelliher this spring, and that when the entire work is completed the Northern Pacific Ry. will operate a direct and fast service between Minneapolis and Winnipeg. The M. and I. Ry. is a subsidiary of the Northern Pacific Ry., which owns or is interested in charters authorizing the building of a number of lines in Manitoba. (Dec., 1907, pg. 889.)

Minnesota, Dakota and Western Ry.—United States press reports state that it is proposed to build an extension of this line from Thief River Falls to International Falls, Minn., this year. The company has in operation a freight service over a line from International Falls to Lohan, Minn., 23 miles, and makes connection with the Duluth, Rainy Lake and Winnipeg Ry. at Falls Jct., Minn., and with the Canadian Northern Ry. at Fort Frances, Ont. E. W. Backus, Minneapolis, Minn., is President, and the head offices are at International Falls, Minn.

Montreal and Northern Colonization Ry.—Application is being made to the Quebec Legislature for an extension of time for the building of the line already

authorized from Montreal to a junction with the National Transcontinental Ry. It is also desired to have power to secure an entrance into Montreal by means of a tunnel. (May, 1911, pg. 411.)

Montreal Transcontinental Ry.—Application is being made to the Dominion Parliament to incorporate a company with this title to build a railway from Montreal northerly and northwesterly to the National Transcontinental Ry., at or near Lake Victoria, Que. C. L. deMartigny, Montreal, is solicitor for applicants.

Moose Mountain Ry.—The Alberta Legislature is being asked to incorporate a company to build a railway from about 3½ miles west of Cochrane, and 26 miles west of Calgary, westerly and southwesterly to the base of Moose Mountain, about 20 miles. Millican and Millican, Calgary, Alta., are solicitors for applicants.

The Mountain Park Coal Co., which has been incorporated under the joint stock companies act, with office at Edmonton, is applying to the Alberta Legislature for authority to build a colliery railway from its coal properties in tps. 45 and 46, ranges 23 and 24 west of the 5th meridian, to a junction with the Grand Trunk Pacific Ry.'s Alberta coal branch and the Canadian North Western Ry. Brazeau line, or either of them. Short, Woods, Biggar and Collisson, Edmonton, Alta., are the solicitors.

Ottawa, Abitibi and Hudson Bay Ry.—Application is being made to the Quebec Legislature to incorporate a company to build a railway from Hull northwesterly along the Coulonge River valley to the Grand Lake Victoria, thence to the National Transcontinental Ry., near Mattagami, and thence to James Bay. H. S. Ross, Montreal, is solicitor for applicants.

Ottawa, Montreal and Eastern Ry.—The Dominion Parliament is being asked for an extension of time within which the line and bridge or tunnel across or under the St. Lawrence River near Montreal, authorized to be built by chap. 141 of the statutes of 1910, may be constructed. Power is also sought to have the capital stock increased to \$10,000,000. Laflamme, Mitchell and Chenevert, Montreal, are solicitors for applicants. (May, 1910, pg. 353.)

Prince Edward Island Ry.—The Dominion Parliament has voted the following sums to be expended upon capital account:—
Original construction\$ 583.33
Line, O'Leary to West Point 29,166.66
Line, Kensington to Stanley Bridge. 58,333.33
(Jan., pg. 23.)

Quebec and Saguenay Ry.—Application is being made to the Quebec Legislature for an act to renew all the rights conferred on the company by chap. 55 of the statutes of 1906; ratifying and confirming the organization of the company, and all the acts of the directors prior to the passing of that act; declaring that the company may build a line from St. Joachim, near the terminal of the Quebec Ry., Light and Power Company's line, following the shore of the St. Lawrence River as far as Ste. Irene and Malbaie, on to the Saguenay River, and across the same to the eastern boundary of the province, as well as branch lines; and extending for three years the time within which the line now being built to Murray Bay may be built, also extending for seven years the time within which the rest of the line may be built.

A. H. N. Bruce, Chief Engineer, is quoted as having stated in an interview Jan. 3, that surveys would be started at an early date for the location of the section of the line from Baie St. Paul to the Chicoutimi district, about 80 miles.

The route will be through the primeval forest to Ha Ha Bay and the Grande Discharge. (Jan., pg. 23.)

Quebec Bridge Construction.—The Dominion Parliament has voted \$1,166,666.66 on account of the building of the bridge across the St. Lawrence River near Quebec, and a further sum of \$320,833.33 as a refund of the subsidies voted by the Quebec Legislature and the city of Quebec to the old Quebec Bridge and Ry. Co. in aid of the building of the bridge which collapsed. (Sept., 1911, pg. 831.)

Rat River Ry.—Application is being made to the Quebec Legislature to incorporate a company with this title to build a railway to be operated by steam, electricity or other motive power, from the copper mine of the East Canada Smelting Co. in Weldon tp., to St. Gerard, Que., on the Quebec Central Ry. Cate, Wells and White, Sherbrooke, Que., are solicitors for applicants.

Tobique Valley Ry.—A deputation from Windsor county waited on the New Brunswick Government, Jan. 4, and urged the subsidizing of an extension of the T.V.R. from Plaster Rock to Riley Brook. The company, under the title of the Tobique and Campbellton Ry., proposes to extend the line from Plaster Rock, via Riley Brook, to a junction with the International Ry. of New Brunswick. The section of the line at present built to Plaster Rock is operated under lease by the C.P.R., and it was stated that any further extension would be similarly operated. (See Tobique and Campbellton Ry. in C.P.R. Betterments, Oct., 1909, pg. 739.)

The Toronto, Hamilton and Buffalo Ry. built during 1911 two additional spur lines in Hamilton, Ont., viz.:—the Westinghouse spur, 0.42 mile, and the Grasselli spur, 0.57 mile. (Sept., 1911, pg. 855.)

Winnipeg, Salina and Gulf Rd.—Press reports state that application has been made to the State Government of Kansas, for authority to issue bonds to provide funds for the building of the Kansas section of the proposed line from Kansas City, Mo., to Des Moines, New Mexico. It is also proposed to build a line from Omaha City to Oklahoma City, Okla. (See Midland Continental Ry., Sept., 1911, pg. 855.)

American Boiler Manufacturers Association.—The 24th annual convention of this association, together with its associate members, and the Supplymen's Association, will be held in New Orleans, La., March 12 to 15. Some very important papers will be presented, and there will be other important business of interest to all boiler manufacturers, and to supply houses dealing with the boiler and tank industry. An extensive programme of entertainment has been arranged, and a large number of boiler manufacturers and supplymen is expected to be in attendance. Information relative to rates, hotel accommodations, etc., will be furnished by F. B. Slocum, Secretary, Supplymen's Association of the American Boiler Manufacturers Association, Continental Iron Works, Brooklyn, N.Y.

St. Boniface Stock Yards.—The Public Markets, Limited, is being organized in Winnipeg to take over and control the union stockyards at St. Boniface, Man. The company will represent the three railways, the shares being divided among them as follows:—C.P.R., 3,334; Canadian Northern Ry. and G.T. Pacific Ry., 3,333 each. The directors will be F. W. Peters, Assistant to the Vice President, for the C.P.R.; J. R. Cameron, Assistant General Manager for the C.N.R., and H. H. Brewer, General Superintendent for the G.T.P. Ry. It is expected that the yards will be opened for business by Oct. 1.

A further consideration was the levels of the different streets to be crossed. Grade crossings of any of the main thoroughfares were not to be considered, either in the interest of the city or the railway, and it so happened that it was only on this line they could be well avoided. At the end of St. Monique St., for example, Lagauchetiere is about 40 ft. above St. Antoine, and St. James about 5 ft. lower. This admits of the line coming out under the former and above the second with a sufficient clearance, and over the third with a liberal margin. St. Antoine rises south, Lagauchetiere and St. James do not. So that

Traffic Orders by the Board of Railway Commissioners.

The dates given for orders are those on which the hearings took place and not those on which the orders were issued.

Rates on Macaroni, Spaghetti and Vermicelli.

15635. Nov. 21, 1911.—Re application of the Transportation Bureau of Montreal Board of Trade, on behalf of Montreal Wholesale Grocers' Guild, under sec. 321 of the Railway Act, for an order reducing the classification of macaroni, spaghetti and vermicelli from 2nd to 4th class for less than carloads, and 4th to 5th class for carload shipments. It is ordered that a supplement to Canadian Classification 15 be issued, reducing the carload rating of macaroni, spaghetti, and vermicelli, from the 4th to the 5th class, to become effective not later than Jan. 15, 1912.

The Regina Rate Case.

15659. Dec. 19, 1911.—Re order 12520 dated Dec. 10, 1910, made upon application of city of Regina, Sask., directing Canadian Pacific and Canadian Northern Ry. Cos. to publish and file new freight tariffs, as provided in the order, to take effect not later than Apr. 1, 1911. A stay having been granted to permit the railway companies interested to appeal to the Supreme Court of Canada from the order, and the appeal having been dismissed by the Supreme Court, it is ordered that the effective date of the new freight tariffs required to be filed under the order be changed to Apr. 1, 1912.

Interswitching at Brandon.

15672. Dec. 22.—Re order 14606, Aug. 21, 1911, fixing, subject to provisions of order 4988, July 8, 1908, the toll of the Brandon, Saskatchewan and Hudson's Bay Ry. for service of interswitching traffic transferred to it by the Canadian Pacific or the Canadian Northern Railways, for delivery to the C.N.R. or the C.P.R. respectively, at Brandon, Man.; and the application of the Brandon, Saskatchewan and Hudson's Bay Ry. to amend the order to provide for a charge covering certain empty movements where C.P.R. cars are being returned home by the C.N.R., and the C.N.R. cars are being returned home by the C.P.R. It is ordered that order 14606 be amended by adding after paragraph 4 the following paragraph:

4. (a) On empty cars transferred between the C.P.R. and the C.N.R., on which the Brandon, Saskatchewan and Hudson's Bay Ry. does not receive loaded revenue under the provisions of this order, the Brandon, Saskatchewan and Hudson's Bay Ry. toll shall not exceed \$2 a car: the toll to be collected from and paid by the C.P.R., or the C.N.R., or both, as may be mutually arranged by the said companies.

White Pass and Yukon Route Rates.

15719. Jan. 2.—Re application of British Yukon Ry., British Columbia Yukon Ry., and Pacific and Arctic Ry. and Navigation Co., for a rehearing, pursuant to the order of the Governor in Council, dated June 16, 1911, and of the Board's order of Jan. 18, 1911; and re application on behalf of Dawson Board of Trade, under sec. 63 of the Railway Act, and the rules governing the procedure before the Board, for an order directing commissions to issue to take evidence in a foreign country, in connection with the said application. It is ordered as follows:—Commissions may issue directed to W. M. Tisdale, attorney at law, Redlands, Cal., and J. P. Hartman, attorney at law, Seattle, Wash., named by and on behalf of the complainant for the examination, viva voce, of witnesses on behalf of the said complainant at Redlands and Seattle aforesaid, before the said commissioners. The respondent companies shall, within three days after the service of this order

upon their counsel, F. H. Chrysler, K.C., file with the Board the names of agents at Redlands and Seattle, who shall represent them and upon whom the commissioners herein appointed may serve notice of the time and place for the taking of evidence authorized under the commission. In the event of the failure of the respondent companies, through their counsel, to appoint such agents, or the failure of the agents to attend at the examination before the commissioners, upon notice, the said commissioners may proceed to execute their commissions as therein authorized. Upon the execution of the said commissions and the examination of the said witnesses and before Feb. 1, 1912, the said commissions and the depositions of the said witnesses and all proceedings taken upon the said commissions shall without delay, after the said commissions shall have been executed, be transmitted to the Secretary of the Board of Railway Commissioners for Canada, at Ottawa.

Rates on Hay.

15724. Nov. 21, 1911.—Re application of Montreal Board of Trade Transportation Bureau, on behalf of shippers of hay in Montreal, under sec. 323 of the Railway Act, for an order disallowing the increased rates on hay from Ontario and Quebec to eastern U.S. points, published by the Grand Trunk, Canadian Pacific, Canadian Northern Quebec, and Quebec, Montreal and Southern Railway Companies, to become effective Oct. 16, 1911,

A GENERAL PURCHASING AGENT'S VIEW.

Adolph Butze, who recently retired, after having been General Purchasing Agent of the Grand Trunk Railway for 16 years, writes:—

"I can assure you I will only be too glad to always have The Railway and Marine World to keep me posted as to what is going on in the way of railway news. I know of no paper to keep me better posted, and I assure you that I wish you every success and prosperity."

and reinstating the rates which were in effect before that date. It is ordered that the tariffs published and filed by the Grand Trunk, Canadian Pacific, Canadian Northern Ontario, Canadian Northern Quebec, Quebec, Montreal and Southern, Central Vermont, Ottawa and New York, Central Ontario, Thousand Island, and Lotbiniere and Megantic Railway Companies, and the New York Central and Hudson River and Rutland Railroad Companies, increasing the rates on hay and straw from Ontario and Quebec to eastern points, the effective date of which was (by order 15080, Oct. 12, 1911) postponed until Jan. 1, 1912, be disallowed.

General Inquiry into Western Freight Rates.

15754. Jan. 2.—Re rates for freight traffic upon railways operating west of Port Arthur. Whereas many general complaints and petitions have been made to the Board against existing freight rates charged by railway companies operating west of Lake Superior, and the Board had been delaying the consideration thereof until the final determination of the Regina rate case; and whereas the Supreme Court of Canada has dismissed the appeal of the Canadian Pacific and Canadian Northern Ry. Cos. from order 12520, Dec. 10, 1910, re application of city of Regina, requiring the discrimination in favor of points in Manitoba, and against points in Saskatchewan and Alberta, to be removed by reducing the class freight rates from Port Arthur and Fort William, and points east thereof, to the said points in

Saskatchewan and Alberta, and the said dismissal having left the Board free to undertake a wider investigation; and whereas the tolls of railway companies operating in British Columbia are already the subject of enquiry by the Board, upon the complaints of the Vancouver Board of Trade and the United Farmers of Alberta; and whereas the Board is empowered by the Act, upon its own motion, to hear and determine any matter or thing which, under the Act, it might enquire into, hear, and determine upon application or complaint; therefore it is declared to be advisable that a general enquiry be at once undertaken by the Board into all freight tolls in effect in Manitoba, Saskatchewan, and Alberta, and in Ontario, west of and including Port Arthur, with the view that, in the event of its being determined that the tolls, or any of them, are excessive, they shall be reduced as the Board may determine. The Board will sit at Ottawa on Feb. 13, to consider the procedure upon the enquiry and give directions with reference thereto.

Car Ferry and Standard Gauge Railway for Prince Edward Island.

The Prince Edward Island Ry. is 3½ ft. gauge, and is owned and operated by the Dominion Government. Connection with the mainland is maintained by Dominion Government icebreaking steamships during the winter, and by privately owned steamships, subsidized by the Government during the open season of navigation. It has always been claimed by the province that one of the terms upon which it entered Confederation was that adequate provision should be made by the Dominion for continuous connection with the mainland, and there has been a constant agitation going on for improved facilities. About 20 years ago a project was under consideration for the construction of a tunnel, and from 1896 onward the project was discussed in and out of parliament. The late government declared itself in favor of the building of a tunnel, but took no active steps toward carrying out the project. Some years ago an alternative project for the operation of a car ferry was put forward, but nothing was done to further it. This company proposed to transfer standard gauge cars to the Island for loading and unloading, thus saving at least one handling of the freight.

An Ottawa dispatch, Dec. 28, stated that an announcement had been made by the Premier that the Government had determined to undertake the establishment of a car ferry service between the Island and the mainland, and that the proposal of the Government would involve the change of the narrow gauge on the island railway to standard. We have since received confirmation of this from the Prime Minister.

At a meeting held in Charlottetown, Jan. 5, a resolution was passed endorsing the project and the standardizing of the gauge of the railway on the Island. W. B. Mackenzie, Chief Engineer of Government railways, who spoke, said that a car ferry was feasible, but it would require to be more powerful than any now in existence. The points between which the ferry would operate were being considered. As to the suggested tunnel its cost would be enormous; the total length, including land tunnels, would be about 12 miles, and at the point where the tunnel would come under the water of the strait there would be 150 ft. of water between the top of the tunnel and the surface.

The main estimates laid before the House of Commons, Jan. 11, contain an appropriation of \$400,000 to provide a car ferry, and make the necessary alterations incidental thereto, including change from narrow to standard gauge.

Canadian Pacific Railway Construction, Betterments, Etc.

Megantic, Que.—Press reports state that engineers are endeavoring to locate a new divisional point nearer the International boundary than Megantic, Que., and that Lowelltown will probably be selected. In a recent interview D. McNicoll is reported as having stated that the divisional headquarters had been moved from Farnham to Sherbrooke, Que., with advantage, and that the question of the removal of the terminals at Megantic to a more suitable centre was under consideration.

St. Martins Jct.-Ste. Therese Grade Revision.—The Board of Railway Commissioners has approved plans for the grade revision between St. Martins Jct. and Ste. Therese, Que., and the carrying of a double track across six highways between the two points.

Ontario Division, Block Signal.—We are officially advised that it is intended to instal a block signal system on the Ontario division between West Toronto and Bolton, Ont., on the Owen Sound-Sudbury line, and on the Toronto-Windsor line between Islington and Streetsville Jct., Ont. It is expected that the work will be started at an early date.

Campbellford, Lake Ontario and Western Ry.—The plans for this line, which will give an alternative route into Toronto, were filed Jan. 10. The new line starts at Glen Tay, on the present Montreal-Toronto line, to which point the second track has been completed from Montreal, and proceeding southwesterly crosses the Kingston and Pembroke Ry. at Parham, and continues southwesterly to Belleville, thence keeping along the shore line south of the Canadian Northern Ontario Ry.'s Toronto-Ottawa line, passes through Brighton, Colborne and Grafton, and joins up with the C., L.O. and W. Ry. location, which was previously approved by the Government. This shows a route along the shore line passing through or near Cobourg, Port Hope, Newtonville, Newcastle, Bowmanville, Oshawa, and thence keeping midway between the G.T.R. and the Canadian Northern Ontario Ry. to a junction with the present line near Leaside Jct.

Georgian Bay and Seaboard Ry.—This recently completed line from Port McNicoll, Georgian Bay, to Bethany Jct., on the Montreal-Toronto line, was passed for traffic by the Dominion Government's inspecting engineers at the end of 1911. The section from the Bay to Coldwater Jct., about 14 miles, has been operated for some time, and a through service is now being operated over the entire line of 88 miles. A description of the terminal facilities at Port McNicoll was given in our last issue.

South Ontario Pacific Ry.—There have been deposited with the Secretary of State at Ottawa a duplicate of a mortgage securing an issue of bonds for the building of this line from Guelph Jct. to Hamilton, Ont., 16.3 miles, and a duplicate of the lease of the same to the C.P.R. for 999 years from Jan. 1.

Collingwood Southern Ry.—Press reports state that C.P.R. engineers are making surveys out of Collingwood for a line to Baxter, on its Toronto-Sudbury branch, and from Collingwood to Utopia, also on the Toronto-Sudbury line.

Manitoba Division Construction.—The new lines under construction in the Manitoba Division include an extension of the branch from Lauder, now ending at Tilston westerly to the provincial boundary, 3.2 miles; an extension of the branch from Virden, now ending at Two Creeks, to McAuley, on the Kirkella-Lanigan line, 23 miles, and a line from Lauder, southeasterly direction to Boissevain, 36 miles.

Saskatchewan Division Construction.

—The new track exclusive of second track and sidings laid on the Saskatchewan Division during 1911 totalled 257.4 miles, and was distributed as follows:—Ageura to Viceroy, on the extension westerly from Weyburn, 23.8 miles; Silton southerly to Valeport on the line south from Bulvea, 7 miles; Imperial southerly to Valeport on the Regina-Colonsay line, 59 miles; Moose Jaw Jct. southerly to Dunkirk, 26.8 miles; from near Anglia to Conquest, 53 miles, on the Moose Jaw-Lacombe-Kerrobert line; from Wilkie Jct. to Cutknife, 27.8; from Swift Current Jct. southeast to Neville, 27 miles; Swift Current northwest to Cabri, 27.8 miles. Steel was laid on 17.3 miles of second track, and there are 5.9 miles under construction between Pasqua and Caron. The extensions under construction are as follows:—Provincial boundary near Tilston westerly to Alida, 21 miles, on the extension from Lauder; an extension of 2.2 miles on the extension of the line westerly from Weyburn; Estevan to Neptune, on the Estevan-Forward line, 55 miles; from Dunkirk to Expanse, on the extension southwesterly, 8.2 miles; from Outlook to Conquest on the Moose Jaw-Lacombe line, 8.0 miles; from Kerrobert to near Tramping Lake, 25 miles; from Wilkie southeast to Kelfield, 35 miles; from Cutknife northerly on the branch from Wilkie, 4.2 miles; from Neville to Vanguard on the branch from Swift Current southeasterly, 18.0 miles, and an extension of two miles on the branch from Swift Current northwesterly.

Lander Extensions.—The Board of Railway Commissioners has approved revised location plans of the branch from Lauder, Man., between mileage 32.28 and 54.63 in Sask. This line will link up with the Stoughton-Weyburn line at Griffin, Sask.

Weyburn to Lethbridge Branch.—The Board of Railway Commissioners has authorized the opening for traffic of the extension of this line from Ogema, mileage 52.2, to Viceroy, mileage 75.85, Sask.

Moose Jaw to Pasqua, Sask., Second Track.—The Board of Railway Commissioners has authorized the opening for traffic of the second track between Moose Jaw and Pasqua, Sask., mileage 127.68 to 134.43.

Swift Current to Brooks.—The Board of Railway Commissioners has approved of revised location plans of this branch to mileage 35.32, and has authorized the opening of the branch for traffic from mileage 0 to 33.

Wilkie-Anglia Branch.—The Board of Railway Commissioners has approved of location plans for this branch from mileage 24.90 to 40.66, and has authorized the crossing and diversion of 14 highways between the same mileages, in Saskatchewan.

Manitoba Lake Branch.—The Board of Railway Commissioners has authorized the opening for traffic of the Manitoba Lake branch from Wilkie to Cutknife, Sask., mileage 0 to 29.8.

Alberta Division Construction.—The company laid 96.3 miles of new track, exclusive of second track and sidings, during 1911, on lines in Alberta, distributed as follows:—Lethbridge to Aldersyde, 56.8 miles; Castor to Coronation, on the extension of the Lacombe branch easterly; and Nightingale to Standard, 17.5 miles, on the line from Irricana easterly. The lines at present under construction are the extension of the Lacombe branch easterly from Coronation to Monitor, 38 miles, and from Basano to Irricana, 36 miles.

Medicine Hat, Alta.—Press reports state that work was started Jan. 4 on the enlargement of the bridge across the river at Medicine Hat, Alta., so as

to enable a second track to be laid over it.

Calgary Shops.—The bylaw confirming the agreement between the Calgary city council and the C.P.R. with respect to the establishment of shops there was carried by 535 votes to 21, Jan. 9. Under the agreement the company agrees to build car shops at a cost of not less than \$2,000,000, and to maintain the same for 21 years, and to convey to the city not less than five nor more than 10 acres as a site for a sewerage disposal plant. The city will release the company from the necessity of maintaining the present car shops, and agrees to have the city boundaries extended so as to take in the lands on which the new shops are to be built, to open up certain highways, and do other works, the most important of which is the extension of the city electric railway to the shops. A second bylaw providing for the extension of the electric railway, the sewage system and the water system to the site of the shops was carried on the same day by 537 votes to 18. A full description of the new shops, with ground plan, is given on another page of this issue.

Strathcona-Edmonton Bridge.—F. W. Peters, Assistant to the Vice President, was in Strathcona, Alta., recently to discuss with the city council the question of the approaches to the high level bridge now under construction over the Saskatchewan River. The principal point in connection with the matter arises out of the high bank necessary. The city desires that the C.P.R. should assume responsibility for the maintenance of the roadway for a number of years in case the bank should slip.

British Columbia Division Construction.—The new track, exclusive of second track and sidings, laid on the British Columbia Division during 1911, totalled 35 miles, 10 miles being on the Waldo branch, and the remainder on the Kootenay Central Ry. between Colvalli and Fort Steele, B.C. The lines under construction at the end of the year were the Kootenay Central Ry. from Golden south to Spillawachen Landing, 42.0 miles, and Fort Steel to Skookumchuck Creek, 21 miles; a branch from Three Forks to McGuigan, 3.6 miles, and a spur line of 3.2 miles at Port Moody.

Rossland Branch.—We are officially advised that the company has under consideration plans for the electrification of its Rossland branch. Recent press reports state that the section of the line to be electrified will be from Castlegar to Rossland.

Port Moody to North Vancouver.—A route plan has been filed with the Department of Railways at Ottawa, for a line from Port Moody, along the north side of Burrard Inlet, to North Vancouver. The plan shows a line starting at mileage 115 on the main line, Cascade subdivision, and terminating at the shore line at D.L. 555. The North Vancouver council, Jan. 9, asked the Minister of Railways not to approve of the plans until the council could be heard on the matter. (Jan., pg. 28.)

The principal new work to be done on the Western lines this year, for which over \$20,000,000 has been appropriated, is dealt with in a separate article on another page of this issue.

The C.P.R. has offered to supply a special train to the Ontario Department of Agriculture to demonstrate and illustrate various schemes for better farming. The train will consist of three baggage cars for material, some cars for lectures, a dining car and sleeping car, for the staff. It will be known as the Better Farming Special, and is expected to start on its itinerary through the province towards the end of February.

The C.P.R. Appropriates \$20,000,000 for Western Lines.

George Bury, Vice President and General Manager, Western Lines, Canadian Pacific Ry., spent about a week in Montreal, in the middle of January, consulting with the President, Sir Thos. G. Shaughnessy as to the work to be done west of Lake Superior during the current year. As a result, over \$20,000,000 has been appropriated for betterments and new construction, in addition to \$2,500,000 previously appropriated for the Calgary shops, and to a large amount which will be spent in additions to the hotel system.

The following branch line construction will be undertaken:—

The branch from Weyburn, Sask., to Lethbridge, Alta., already built to Viceroy, Sask., about 75 miles from Weyburn, will be extended west for about 100 miles, and a start will probably be made on this line in Alberta, and at least 25 miles built there. This line, when completed between Viceroy and Lethbridge, will give a through route from Winnipeg via the Crows Nest Pass, to Nelson, etc., entirely independent of the main transcontinental line.

The branch from Swift Current northwesterly, on which track has been laid for 33 miles to Cabri, will be extended for about 85 miles. It is the intention to connect this branch with the main transcontinental line again at Bassano, or in that vicinity, which will give an alternative route with the present main line via Medicine Hat. The new line will be only three or four miles shorter than the main line route, but it is being built to a 0.4 gradient, and will therefore be better adapted for freight traffic.

A branch from the main transcontinental line, some 50 miles west of Medicine Hat, will be built for between 30 and 40 miles southwesterly into the southwest Alberta irrigated land section.

The second tracking of the main transcontinental line will be gone on with at the most congested points. Already there is a second track between Port Arthur, Ont., and Brandon, Man., 555.8 miles, and between Pasqua and Caron, Sask., 23 miles. This year second track will be laid between Regina and Pasqua, 34.9 miles, and between Caron and Chaplin, Sask., 37.8 miles, which, with the second track already built between Pasqua and Caron, will give a continuous second track from Regina to Chaplin, 95.7 miles. From Regina east to Brandon and Winnipeg, in addition to the main transcontinental line, there is the alternative route via Stoughton, Reston and Souris.

A second track will be built for about 5½ miles from Maharg, the site of the new shops, 4.5 miles east of Calgary station, to about one mile west of Calgary station. This will provide for the heavy traffic near Calgary, especially between that place and the new shops site.

A second track will also be built between Hammond, B.C., and Vancouver, 24.1 miles.

One of the most important of the year's works will be the relaying of nearly 500 miles, with 85 lb. steel rails, to replace the present lighter weights. Of this mileage over 300 miles will be laid on the line between Portage la Prairie, Man., and Edmonton, Alta., via Saskatoon, and the balance on various other sections.

A press report from Winnipeg to the effect that the company was preparing to change its main line route by abandoning the Kicking Horse pass in favor of the Crows Nest pass, is not believed to have any foundation, and there appears to be little doubt that the whole of the present main transcontinental line from Port Arthur to Vancouver will be gradually completed as a double track

route. The line between Macleod, Alta., and Crows Nest is, however, to be considerably improved, by reducing the present 1% gradient to 0.6 west bound and 0.4 eastbound.

At Fort William, coal docks and a coal handling plant, an illustrated description of which appears on another page, will be built on Island no. 1, at a cost of over \$1,000,000. A freight shed with 25,000 tons capacity will also be built there, as well as a dock to handle steel rails and an addition of 500,000 bush, to the elevator capacity.

The great increase of traffic and the consequent congestion of the very large yards at Winnipeg has rendered it imperative to establish larger yards, where much more room can be obtained. Two schemes are under consideration, but it appears probable that a cut-off will be built on the main transcontinental line, from East Selkirk, on the Red River, 20.8 miles below Winnipeg, to Reaburn, 35.3 miles west of Winnipeg, necessitating a bridge over the Red River. Should this scheme be finally decided on the yards will probably be established at or near Reaburn, so that through freight trains would not pass through Winnipeg. Similar congestion at Vancouver will be got over by establishing a large yard at Coquitlam, B.C.

At Brandon, Broadview, Man., Regina and Outlook, Sask., the yard capacity will be doubled. At Moose Jaw and Swift Current, Sask., the yard capacity will be increased a third. At Alyth, Alta., 2.3 miles east of Calgary, there will be an addition of a fourth to the capacity of the new yards. Extensive improvements and extensions will be made to the freight sheds, team tracks, etc., at Saskatoon, Sask.

Extensive improvements are planned for Vancouver, including additions to freight sheds, yards, etc., involving large expenditures, but the plans, including those for a new passenger station, are not yet completed.

A handsome station will be built at Edmonton, Alta., and about 75 stations at other points.

Block signalling is to be installed between Fort William and Winnipeg, and also in the Calgary district.

Air Brake Equipment for all Trains.

The Board of Railway Commissioners will consider at Ottawa, on Feb. 6, the amending of order 8145, Sept. 14, 1909, as follows:—

"Every such railway company shall not run any train which is not equipped with air brake connection between the conductor's van, or van on rear end of train, and the locomotive engineer. Where cars are handled in trains which are not equipped with air brakes but fitted with straight air pipe, no two such cars shall be placed together in any part of the train. Every such railway company shall be liable to a penalty of not exceeding \$25 for every failure to comply with the foregoing regulations within the time for their coming into force and thereafter."

Hon. F. M. Young, of Manitoba, has been elected Chairman of the Senate Committee on Railways, Telegraphs and Harbors.

C. Morrow, formerly agent, Quebec Central Ry. at Thetford Mines, who was recently charged with misappropriation of funds, and discharged on account of irregularities in the preliminary hearing, was again before the King's Bench at Quebec, Jan. 11, on the same charge. The matter was adjourned for a month for consideration of a motion to dismiss the case.

Canadian Northern Ry. Coal Dock at Port Arthur.

The Canadian Northern Coal and Ore Dock Co., Ltd., a subsidiary of the Canadian Northern Ry. has under construction an extension of its coal dock at Port Arthur, Ont. Some work was done during 1911, and the new work when completed will double its capacity. The cost of the original dock was about \$1,000,000, and the addition will cost about \$500,000. There will be three unloading towers, and a most complete coal handling plant and storage sheds, the machinery being operated by a steam plant of 1,000 h.p. The plant will be capable of unloading a 10,000-ton steamer in 18 hours, and can at the same time load direct from the vessel 225 cars of coal in 10 hours, or pick up from the pile 175 cars of coal in the same time. During the last season the plant handled 957,000 tons of coal of all kinds.

The dock when completed will have a frontage of 616 ft. to the harbor, and the unloading tracks, with the three towers, will extend along this for about 450 ft. The area devoted to the plant extends for a depth of 2,525 ft. from the harbor front. Running through the centre are railway tracks on which the coal is loaded from the various coal pockets which are fed by the conveyors running from the unloading plant. Beyond these coal pockets are three storage sheds, no. 1 having an area of 288 by 244 ft., and the other two being 276 by 205 ft. each. These are also served by the conveyor system, and have their separate coal pockets for loading the coal into cars brought in on the spur railway tracks. At the inshore line there is located the office, and just outside on the spur line are the track scales. Shed no. 3, with its coal pockets and tracks, is outside, but adjoining the area already mentioned, so that at the inshore line the plant covers an area of about 1,000 by 300 ft.

The actual work of the extension will consist of improvements to the south side of the dock, adding bituminous coal storage to the present dock of 250 ft. wide by approximately 2,000 ft. long, removing the old anthracite coal shed and building a 60,000 anthracite shed, adding 144 ft. additional loading pockets for the bituminous coal, also adding a double pick up storage bridge on the south side, together with rearranging the trackage and scales. The dock end improvements will consist of putting in a revetment wall along the south side and across the outer edge of the dock some 2,600 ft. of heavy tongue and groove sheet piling. The Barnett-McQueen Co. has a contract to put in the foundation for the dock; the company owning the dock will do the filling work itself, either by ballast trains or by hydraulic dredging, and the equipment will be supplied by the firms manufacturing it.

St. John's Ambulance Association on the Government Railways.—A centre of the St. John's Ambulance Association has been formed for the Dominion Government Railways, the patrons being the Minister and Deputy Minister of Railways; the President and Vice Presidents, being the members of Government Railways Managing Board, with W. C. Paver, Secretary, Insurance and Provident Society, as Secretary, and the following as an executive committee: G. R. Joughins, Superintendent Motive Power; T. C. Burpee, Engineer of Maintenance; J. T. Hallisey, Superintendent, Truro, N.S.; Y. C. Campbell, Superintendent, New Glasgow, N.S.; E. Price, Superintendent, Campbellton, N.B.; and G. A. Sharp, Superintendent, P.E.I. Ry., Charlottetown.

S. P. Porter, Deputy Minister of Railways and Telephones for Saskatchewan, has resigned.

Canadian Northern Railway Construction, Betterments, Etc.

Canadian Northern Quebec Ry.—We are officially advised that the projected line from St. Jerome to St. Eustache, Que., is an old project for which a trial line was run some years ago, but which it was not deemed advisable to build until the Montreal approaches were completed. The building of this piece of line will give a more direct connection between Montreal and the old Great Northern Ry. than at present exists. It is also expected that a cut off between St. Stanislas and St. Justin will be located during the winter. By this it is hoped to cut out some six or eight miles of the distance between Montreal and Quebec, and to eliminate heavy curves on the original Great Northern Ry. and the Laurentide Ry., bringing the entire line to a 0.4 and 0.5 standard gradient, as between Quebec and Port Arthur. Another object of the work is to place Shawinigan Falls on the main line for passenger traffic, instead of on a branch. A trial line was run for this piece of work during 1910-11 by A. W. Whitney, and the present surveys are being made by Jno. Congdon, under the direction of H. K. Wicksteed, M. Can. Soc. C.E., Chief Engineer of Surveys.

The development of the company's plans in the vicinity of Montreal are dealt with separately on another page.

Canadian Northern Ontario Ry.—The Board of Railway Commissioners has authorized the company to use for construction purposes only, pending the completion of an interlocking plant, a crossing of the C.P.R. at Chaudiere Jct., Ottawa.

Press reports from Ottawa states that G. H. Shaw, General Traffic Manager, is negotiating with business interests in the city regarding the building of a spur line to serve the industrial concerns west of the C.P.R. tracks near Carling Ave.

The Board of Railway Commissioners has approved of revised location plans for the line through Loughborough tp., authorized the building of a branch line from Oshawa station to Oshawa town, to connect there with the projected Toronto Eastern Ry., 3.95 miles, and also authorized the building of a spur line by the G.T.R. for joint use with the C.N.O. Ry. on the Don Esplanade, Toronto.

The plans for the entrance of the company's line from Toronto into Hamilton, were expected to be filed Jan. 20. It is reported that the entire right of way has been acquired, and that over 300 houses and other buildings will have to be taken down or moved. Local reports state that the plans will give rise to considerable discussion before they are approved by the city council.

The construction of the Ottawa-Pembroke section of the line to Port Arthur, the contract for which has been let to J. P. Mullarkey, covers the building of two large bridges. That above Chats Fall, on the Ottawa River, will consist of 20 spans, while that at Portage du Fort will be somewhat smaller. The Board of Railway Commissioners has approved of the revised location of the line between mileage 162 to 176 in this section.

The Board of Railway Commissioners has also approved of revised location plans for the line between mileage 325.23 and 343.55 from Montreal, which carries the line to a point between the C.P.R. and the G.T.R. lines at Nipissing Jct., and for the location of the line between mileage 346.37 and 366 from Montreal, and between Capreol Jct., mileage 0 and 71.81. These mileages come within the contract between Ouwa-tin and Pembroke, which Angus Sinclair has. Ouwa-tin is at mileage 276 on the line from Toronto northerly via Gowganda Jct., and the work is to be

pushed easterly from there with a view of getting the line into North Bay by the end of the present year, and having it completed through to Pembroke, to connect up with the J. P. Mullarkey contract by the end of 1913. Sub-contracts are reported to have been let for the first hundred miles of the work, and work is reported to have been started at North Bay, both easterly and westerly.

The Board of Railway Commissioners has approved of revised location plans through unsurveyed territory in Algoma between mileage 148 and 166; between 209 and 225.42; between 237 and 327, and between 497.16 and 498, all from Sudbury Jct.

Canadian Northern Ry.—Press reports state that some negotiations are in progress which will result in the building of lines which will provide a connection between the terminus of the C.N.R. branch line at Gungfint Narrows on the International boundary, and Duluth, thus giving a shorter and more direct connection between Port Arthur and Duluth than is now afforded.

The completed report of the construction department for 1911, shows that 446.10 miles of track was laid on lines in Manitoba, Saskatchewan and Alberta, and that 369.09 miles of grading was completed within the same provinces. A considerable mileage of grading was carried over from 1910, and of the grading done in 1911, track will not be laid on considerable mileage until the summer. Grading was done on 11.5 miles of what is known as the Winnipeg and Northern Ry. branch, and on the Shellmouth branch track was laid from Hampton, Man., northerly for 12.96 miles, and 12.2 miles of grading have been completed. Work was done on the following lines in Saskatchewan:—Track laid from Grosse Isle northerly for 26.37 miles on the Grosse Isle branch; on the Maryfield branch 0.31 mile of track was graded and 27.3 miles of track laid from Ceylon, westerly; on the Swift Current branch 31 miles of grading were completed; grading was completed on the Jackfish branch on 19 miles, and track was laid from Walta northerly for 17.41 miles; grading was done on 9.12 miles of the branch from Denholm easterly; track was laid from Shellbrook westerly for 37 miles on the Prince Albert-Battleford branch; on the Thunderhill branch track was laid from Pelly westerly for 34.26 miles; from Delisle southerly 46 miles of track were laid on the Delisle extension, and 1.37 miles of grading done, while on the Moose Jaw branch track was laid from Radville northerly for 82 miles, and 25.16 miles of grading was done. In Alberta, grading was done for 0.28 of a mile on the Vegreville-Calgary branch, and track was laid southerly from Red Deer River for 22.3 miles; grading for 41 miles was completed on the Strathcona-Camrose branch line; on the Brazeau branch track was laid for 65 miles from Stewartyn westerly, and 62.93 miles of track laid; on the main line, called the Canadian Northern Alberta Ry., 104.85 miles of grading was completed, and 20 miles of track laid from St. Albert westerly; on the Morinville branch, track was laid for 55.5 miles from Morinville northerly, and 32.67 miles of track laid; while on the Peace River branch, 17 miles of grading was completed.

Duluth, Winnipeg and Pacific Ry.—We are advised that during 1911 track was laid on 50 miles between West Duluth and Paleface River, Minn.; and that an extension of two miles from West Duluth to the water front at Duluth is under construction. The contractors are Foley, Welch and Stewart, St. Paul, Minn. The completion of this line will give the Canadian Northern Ry. a direct line into Duluth from Winnipeg and Port Arthur via Fort Frances, Ont.

Canadian Northern Pacific Ry.—It was reported in Vancouver Dec. 31, that there were 5,400 men at work on the section of the line under construction between Port Mann and Kamloops, B.C. Representatives of Twohy Bros., who have a sub-contract on the line from Kamloops easterly, have arranged for wharfage accommodation at Kamloops, B.C., for getting in supplies for their work on the line near Louis Creek. In order to get in a steam shovel on the work they had to move it a couple of miles from near Ashcroft, and build a bridge across the North Thompson to get it on the job. At the Tete Jaune Cache end of the line the contractors have got in large quantities of supplies and materials for the building of two steamboats for use on the river. Certificates have been issued by the Minister of Railways for British Columbia, approving of plans for level crossing and diversion of wagon road at Spences Bridge, and for the diversion of wagon road at Ashcroft Bridge; and for a connection with the New Westminster Southern Ry. near Port Kells, 8.6 miles from New Westminster bridge.

Vancouver Island.—The Minister of Railways for British Columbia has approved plans for overhead bridges at Burnside Road, mileage 5.2, from Victoria; Atkins road, mileage 6.0 from Victoria, and for a number of level crossings between mileage 5.2 and 23.6 from Victoria. Work has been started by Moore and Pethick on the 40 mile section of the line extending beyond the summit at the west end of the Esquimalt and Nanaimo Ry.'s Cowichan Lake line.

Canadian North Eastern Ry.—The Minister of Railways for British Columbia has authorized the operation of the railway from the wharf at Stewart to Glacier Creek station, five miles. While the certificate is dated July 21, 1911, it was not made public until Dec. 21.

Eastern Canadian Passenger Association.

At the annual meeting in Montreal, Jan. 4, officers and standing committees for the current year were elected as follows:

Chairman, A. J. Parr, G.F. & P.A., Temiskaming and Northern Ontario Ry. Executive Committee, W. Stitt, G.P.A., Eastern Lines, C.P.R.; T. Henry, T.M., Richelieu and Ontario Navigation Co.; H. G. Elliott, G.P.A., Grand Trunk Ry.

Rules Committee, W. Stitt, H. G. Elliott, G. Tombs, G.F. & P.A., Eastern Lines, Canadian Northern Ry., J. W. Hanley, G.P.A., Central Vermont Ry., C. Hartigan, G.P.A., Rutland Rd. F. F. Backus, G.F. & P.A., Toronto, Hamilton and Buffalo Ry., W. H. Underwood, A.G.P.A., Michigan Central Rd., J. M. Lyons, G.P.A., Intercolonial Ry., R. L. Fairbairn, A.G.P.A., Eastern Lines, Canadian Northern Ry.

Secretary, G. H. Webster.

Immigrant Traffic for Western Canada.—The Trans-Atlantic lines for many years past have been carrying immigrants through United States ports to Western Canada exclusively via Port Arthur, for example, from New York over the New York Central Rd. to Montreal or Prescott, thence by C.P.R. via Port Arthur to Winnipeg, thence to destinations beyond Winnipeg. The Grand Trunk Ry., in view of a new immigrant tariff about to be issued, desired to secure a portion of this traffic by the Lehigh Valley Rd. from New York to Niagara Falls, thence by G.T.R. to Chicago and connecting lines to Winnipeg, thence beyond by G.T. Pacific Ry. on exactly the same basis of fares as apply via Port Arthur. After considerable negotiations this new representation via Chicago to G.T.P.R. stations has been conceded.

THE Railway and Marine World

Established 1898.

Index to The Railway and Marine World for 1911.

At the commencement of this issue
will be found a very complete index to
The Railway and Marine World for
1911, which can easily be detached for
binding with the issues of that year.

The index, which is divided into four
sections, Steam Railway and General
Matter, Electric Railway Department,
Marine Department, and Personal, cov-
ers eight pages of closely printed mat-
ter, and will prove invaluable for refer-
ence purposes.

An examination of it will show the
great range of matter published and
subjects dealt with, and how thoroughly
the whole transportation field through-
out Canada is covered.

All departments of steam and electric
and marine transportation interests are
dealt with, our paper combining techni-
cal articles for the mechanical and en-
gineering departments, practical matter
for the maintenance of way, operating
and traffic and other departments, and
a great volume of news of interest and
value to anyone engaged in any branch
of transportation business.

Accuracy is our chief aim; no effort
is spared to secure it, and, as a result,
we know that our matter is relied on
and appreciated. As a result our sub-
scription list shows a most satisfactory
increase during the whole of the past
year. The increased volume of adver-
tising speaks for itself.

Transportation Conventions in 1912.

Passenger Rate Meetings at Detroit.

The annual meetings of the Niagara
Frontier Summer Rate Committee, the
Great Lakes and St. Lawrence River
Rate Committee and the International
Water Lines Passenger Association were
held at Detroit, Mich., in January. The
rate clerks, as usual, met on Jan. 17 and
18 and revised the rates to be submitted
to the general meetings.

The International Water Lines Pas-
senger Association met Jan. 18, when
the retiring president, T. Henry, Traffic
Manager, Richelieu and Ontario Naviga-
tion Co., was presented with a gavel, the
presentation being made by B. W.
Folger, General Manager, Niagara Naviga-
tion Co., on behalf of the donors. A.
A. Heard, General Passenger Agent,
Champlain Transportation Co., Albany,
N.Y., was elected President, and M. R.
Nelson, Northern Steamship Co., New
York, was re-elected Secretary.

The Niagara Frontier Summer Rate
Committee met Jan. 19, when the retir-
ing chairman, D. N. Bell, A.G. P.A.
Pennsylvania Rd., was presented with a
gavel. L. W. Landman, G.P.A. Michigan
Central Rd., Chicago, was elected chair-
man. Jas. Morrison, chief rate clerk,
C.P.R., Montreal, was re-elected Secre-
tary, the position being made permanent.
The fares as compiled by the rate rep-
resentatives were approved. Application
for membership from the Merchants
Montreal Line and from the Niagara, St.
Catharines and Toronto Ry. and Naviga-
tion Co. were refused.

The Great Lakes and St. Lawrence
River Rate Committee also met Jan. 19,
W. F. Wasley, Manager, Muskoka Lakes
Navigation and Hotel Co., being elected
Chairman. The representatives of the
various steamboat lines announced their
fares for 1912, which the Secretary was
instructed to embody in the proceed-
ings. The Port Huron and Duluth
Steamship Co. and the Chicago and
Duluth Transportation Co. were admitted
to membership.

During the afternoon of Jan. 19 a large
number of those attending the meetings
were the guests of the Michigan Central
Rd. on a special train, and visited the
Detroit-Windsor tunnel and the ter-
minals on both sides of the river.

The meetings in Jan., 1913, will be
held at Ottawa, Ont.

C.P.R. Officials Dinner.—About 150
C.P.R. officials attended the "first family
gathering" at the Place Viger Hotel,
Montreal, Dec. 30, under the chairman-
ship of G. H. Ham, of the headquarters
staff. The President's health was re-
sponded to by his son, A. T. Shaughnessy,
who has since left the company's service
to go into a financial business. Other
speakers were C. E. E. Ussher, V. G. R.
Vickers, H. H. Vaughan, F. P. Gutelius,
Capt. Walsh, M. McDuff, F. R. Perry,
Boston; J. A. Cantlie, J. J. Corbett, W.
Stitt, H. E. Suckling, J. Kent and W.
J. Camp. M. J. Power, the President's
Secretary, gave a very amusing stump
speech. There was a capital musical
programme, and also moving pictures,
showing a trip over the system from
Liverpool to Hong Kong.

The Minister of Railways for British
Columbia has authorized N. McL. Cur-
ran to issue tariffs of tolls for the Cana-
dian North Eastern Ry., and has approv-
ed passenger and freight tariffs prepar-
ed, for use on the line between Stew-
art and Glacier Creek, B.C.

Mainly About Transportation People.

G. R. R. Cockburn, of Toronto, father in law of Sir Thomas Tait, died in London, Eng., Jan. 18.

T. Ahearn, President, Ottawa Electric Ry., returned to Ottawa Jan. 1 from a trip to Switzerland.

D. B. Hanna, Third Vice President, Canadian Northern Ry., returned to Toronto from Great Britain, Jan. 20.

Thos. McClelland, assistant car foreman, C.P.R., Montreal, was fatally injured in the Outremont yards, Jan. 14.

W. Wainwright, Vice President, G.T.R., is one of the directors of the newly incorporated Upper Fraser River Lumber Co.

G. C. Fletcher, for a number of years union ticket agent at the Windsor Hotel, Montreal, has retired to enter private employ.

The engagement is announced of Miss M. Angus, daughter of R. B. Angus, director, C.P.R., to Dr. C. F. Martin, Montreal.

Hon. A. L. Sifton has been appointed Minister, and W. J. Harmer Deputy Minister of Railways and Telephones for Alberta.

S. Buchanan, Superintendent, C.P.R. Upper Lakes Service, Owen Sound, Ont., was married recently to Miss M. Wilson, Detroit, Mich.

The engagement of D. E. Galloway, Assistant to the President, G.T.R. and G.T.P.R., and Miss L. B. Eaton, Toronto, is announced.

W. Wainwright, Vice President, G.T.R., and Second Vice President, G.T.P.R., has been elected Vice President, Guarantee Co. of North America.

T. F. English, who has resigned the position of Local Freight Agent, Calgary, Alta., has been appointed collector of customs there.

C. Arlien, foreman, Michigan Central Rd. boiler shop, St. Thomas, Ont., was presented with a mahogany pedestal by the employes recently.

Miss M. Welch daughter of P. Welch, of Foley, Welch and Stewart, railway contractors, was married to M. Miller, in Spokane, Wash., Jan. 5.

Sir Wm. Whyte has been elected Hon. President of a league which has been inaugurated in Winnipeg to promote immigration to the province.

H. W. Brodie, General Passenger Agent, C.P.R., Vancouver, B.C., and Mrs. Brodie, sailed from that city during Christmas week for Honolulu.

J. W. Higgins, Assistant General Manager, Missouri Pacific Ry., has been promoted to General Manager, succeeding A. W. Sullivan, resigned.

C. C. Van Arsdol, Division Engineer, G.T. Pacific Ry. construction, Hazleton, B.C., returned there after spending Christmas with friends in Idaho.

Hon. J. Sharples, who has been associated with the directorate of railways centering in Quebec city, has resigned the presidency of the Union Bank.

C. Stiff, at one time an official of the old Great Western Ry., has resigned the secretaryship of the Hamilton, Ont., Board of Trade, owing to ill health.

Sir William and Lady Mackenzie returned to Toronto, Jan. 17, via New York, after spending Christmas and New Year in Europe, principally in Paris.

J. Piper, Roadmaster, G.T.R., Brantford, Ont., was the recipient of an address and New Year's gift from the men under him on sections 20, 21 and 22.

H. G. McMicken, European Traffic Agent, Great Northern Ry., London, Eng., and Mrs. McMicken, arrived in Winnipeg, recently for a short holiday.

L. Meagher, who had been engaged in

construction on the Canadian Northern Ry. in Saskatchewan, died at Toronto, Jan. 13. He was a nephew of Lady Mackenzie.

Sir Wm. Mackenzie, President, and Sir Donald Mann, Vice President, Canadian Northern Ry., have been appointed Knights of Grace of the Order of St. John of Jerusalem.

Miss A. Kennedy, daughter of J. H. Kennedy, Chief Engineer, Vancouver, Victoria and Eastern Ry., was married in Vancouver, B.C., Jan. 11, to H. P. Cowan, of Montreal.

H. G. McMicken, European Traffic Agent, Great Northern Ry., U.S., remembered many of his old friends in Canada with some interesting verses and a useful souvenir.

Sir James C. Inglis, past-President of the Institution of Civil Engineers and General Manager and Consulting Engineer of the Great Western Ry. of England, died recently.

F. C. Salter, European Traffic Manager, G.T.R., London, Eng., and P. A. Clews, acting General Agent, G.T.R.,

A. Shields,
General Master Mechanic, Canadian
Northern Railway.

Antwerp, Belgium, arrived in Canada, Jan. 4, on a business trip.

Sir Donald Mann, who has been staying in San Francisco and vicinity for some time, left there Jan. 21 for Vancouver, B.C. He is expected to return to Toronto early in February.

Major Leonard, M. Can. Soc. C.E., Chairman, National Transcontinental Ry. Commission, has given a second donation of \$500 towards the erection of a Y.M.C.A. building in Cobalt, Ont.

J. J. Houghton, who has resigned the position of Chief Inspector, C.P.R. Time Service, was entertained at dinner by the department staff at Montreal recently, and presented with a purse of gold.

J. R. Nutter, chief clerk to the Superintendent of the Eastern Division, G.T.R., Montreal, was presented with an address and a purse of gold recently by the staff on retiring after 28 years service.

J. T. Wallace, Superintendent of the West Jersey and Sea Shore Rd., at Camden, N.J., has been appointed General Superintendent of Motive Power of the

Pennsylvania Rd., succeeding the late R. N. Durborrow.

J. W. Stewart, of Foley, Welch and Stewart, railway contractors, was reported Dec. 25 to be recovering from a severe illness, and it was said he expected to leave Spokane, Wash., for a European trip as soon as possible.

C. W. Spencer, formerly Manager, Mackenzie, Mann and Co.'s eastern lines, and for many years in the C.P.R. service, who died in Montreal recently, left an estate valued at \$127,066 to two sons and a daughter in equal shares.

J. T. Harahan, Sr., ex-president of the Illinois Central Rd., F. O. Melcher, second Vice President, Rock Island Rd., and E. B. Pierce, General Solicitor, Rock Island Rd., were killed in a collision of two Illinois Central trains at Kinmundy, Ill., Jan. 22.

D. J. Scott was given a purse of gold by Canadian Northern Ry. officials, Winnipeg, recently, on his promotion from chief landing master at the C.N.R. Customs to that of the assistant surveyorship for Winnipeg. A diamond brooch was given Mrs. Scott.

G. C. Wells, Assistant to Passenger Traffic Manager, C.P.R., has been appointed as the Eastern Canadian Passenger Association's representative on the standing digest executive committee of the American Association of General Passenger and Ticket Agents.

J. S. Pyeatt, who has been appointed Vice President and General Superintendent, Fort Worth and Rio Grande Ry., and St. Louis, San Francisco and Texas Ry., was, up to the early part of 1911, Superintendent, Canadian Division, Pere Marquette Rd., St. Thomas, Ont.

B. W. Folger, General Manager, Niagara Navigation Co., M. H. Brown, Division Freight Agent, C.P.R., and L. MacDonald, Division Freight Agent, G.T.R., have been elected representatives of the Transportation Lines on the Toronto Board of Trade's general committee.

L. McCrea, Seamen, Sask., who was engaged as section foreman under Sifton, Ward and Co., on the construction of the C.P.R. across the Julius muskeg, east of Winnipeg, in 1877, paid a visit to Winnipeg during the Christmas holidays, after an absence of many years.

John Leadley, who died in Toronto, Jan. 13, aged 87, was father of E. Leadley, of the G.T.R. Freight Claims Department, W. T. Leadley, of the G.T.R. freight department, Toronto, and of A. Leadley, Freight and Passenger Agent, Delaware, Lackawanna and Western Rd., Toronto.

Sir William Mackenzie left Toronto for Ottawa, Jan. 17, soon after his arrival from Europe, and on the following day left Ottawa for the west, accompanied by M. H. McLeod, General Manager, and T. G. Holt, Executive Agent, Canadian Northern Ry., for British Columbia.

H. Souette, railway contractor, Bridge-water, N.S., fell dead in the street there, Jan. 8. He had contracts for building sections of various lines in Quebec, New Brunswick and Nova Scotia during the last 35 years, the last one being a portion of the National Transcontinental Ry. near Edmundston, N.B.

B. E. Bush, President of the Missouri Pacific Ry., has been elected President of the Denver and Rio Grande Rd. also, succeeding E. T. Jeffery, who has been President since 1895. Mr. Jeffery has been made Chairman of the Board of Directors, succeeding George J. Gould, and will have charge of finances.

Hugh Sutherland, Executive Agent, Canadian Northern Ry., Winnipeg, and Mrs. Sutherland sailed from New York Jan. 20 on the s.s. Franconia for Alexandria, Egypt. They will go up the Nile and afterwards visit Italy and other places in Europe, expecting to return to Winnipeg about the end of April.

C. R. Scoles, General Manager, Atlantic, Quebec and Western Ry., New Carlisle, Que., recently gave evidence for the defence in the case against A. W. Carpenter for fraud in connection with the failure of the Charing Cross Bank, London, Eng., which was responsible for the financing of the railway construction.

W. R. Taylor, of Askwith, Taylor and Co., railway contractors, Ottawa, who died in Aylmer, Que., Jan. 14, entered the G.T.R. service in 1885. Two years later he removed to the U.S., going into the Missouri Pacific Ry. service, and returned to Canada in 1895 to become Manager of the Hull Electric Co., which position he resigned in 1909.

D. Bowker, who is said to be the oldest locomotive engineer in the C.P.R. service, retired from the service Jan. 1. He entered the service of the old South Eastern Ry. during its construction in 1869, and continued with the C.P.R. when it took over the line. During his 40 years service hauling passenger trains he never had an accident.

A. Butze, who has retired from the position of General Purchasing Agent, G.T.R., Montreal, under the provisions of the pension fund, was born at Quincy, Ill., in 1845. Prior to entering G.T.R. service in 1895, he served with the Wabash Rd., Missouri Pacific Ry., and the Monon Route. He was a participant in the American civil war.

W. G. Chace, A.M. Can. Soc. C.E., of Smith, Kerry and Chace, Toronto, has removed his headquarters from Winnipeg, where for the past five years the firm has had charge of the construction of the municipal hydro electric plant, to Portland, Ore., where he will have charge of the completion of the Mount Hood Railway and Power Co.'s works.

Henry Osborn, who died in London, Eng., Jan. 4, aged 82, was well known in New Brunswick, having been, from 1860, Manager, New Brunswick and Canadian Ry., St. Stephen. This railway was afterwards known as the New Brunswick Ry., of which he was a director, and for some time, President. He returned to live in England about 1888.

T. Rumney, General Mechanical Superintendent, Erie Rd., has resigned and will become General Superintendent of Motive Power of the Chicago Rock Island and Pacific Ry., at Chicago, Ill., succeeding W. A. Nettleton, resigned. Mr. Rumney is succeeded as General Mechanical Superintendent of the Erie Rd. by W. Schlafge, Mechanical Superintendent at Jersey City, N.J.

Matthew Neilson, M. Can. Soc. C.E., died in Montreal, Jan. 21, aged 59, of pleuro-pneumonia, and was buried at Kingston, Ont. He was at one time Manager of the St. John, N.B., Railway, and afterwards Consulting Engineer, Montreal St. Ry. Latterly he has practiced as a consulting engineer, and has been acting as Vice President and General Manager, Alberta Central Ry.

The Montreal Star publishes a list of Montreal millionaires numbering 94, including Lord Strathcona, Sir Wm. C. Van Horne, Sir Thos. G. Shaughnessy, Sir H. Montagu Allan, Sir Rodolphe Forget, M.P., J. Ross, C. R. Hosmer, H. S. Holt, T. J. Drummond, G. E. Drummond, W. I. Gear, W. G. Ross, R. B. Angus, R. Reford, M. H. Hersey, N. Curry, E. T. Galt and Hugh Paton.

The Canadian Ticket Agents' Association has had the following additions to its membership recently in Ontario:—S. Young, G.T.R., Lucknow; A. T. Agar, C.P.R., Sudbury; J. H. Welch, K. and P.R., Kingston; R. McKenzie, C.P.R., Theford; G. Sylvester, C.P.R., St. Joachim; J. J. Corley, C.P.R., Midland; W. J. Jones, C.P.R., Parry Sound; A. M. Chapman, Frankford.

G. H. Massy, Chief Engineer and director, Reid Newfoundland Co., who

died at Westmount, Que., recently, was born in Ireland. He came to Canada in 1871, and subsequently was engineer in charge of the construction of the Chaudiere bridge, Ottawa, the C.P.R. bridge over the St. Lawrence River at

P250 John Paul,
District Freight Agent, Canadian Northern
Ry., Winnipeg.

Lachine, Que., and the Sault Ste. Marie bridge. He was connected with the Reid Newfoundland Co. since 1897.

Sir Rodolphe Forget, M.P., President, Richelieu and Ontario Navigation Co., and Lady Forget, were passengers on a

P251 J. H. Guess,
General Purchasing Agent, Grand Trunk
Railway.

train between Montreal and Quebec which was in a collision near the latter city, Jan. 8. They escaped injury. Sir Rodolphe was the principal guest at a dinner given by the Choral Society of

St. Louis de Francé, of which he is honorary vice president, in Montreal, Jan. 11.

A. C. Egan, who has been appointed Auditor of Agencies, Canadian Northern Ry., Winnipeg, was born there Oct. 6, 1883, and entered railway service Aug. 15, 1901, since when he has been, to Aug. 15, 1904, accountant, Local Freight Department, C.P.R., Winnipeg; Aug. 15, 1904, to May 1, 1909, in C.N.R. Audit Department, Winnipeg; May 1, 1909, to Dec. 1, 1911, Chief Travelling Auditor, C.N.R., Winnipeg.

F. N. Gibbs, M. Can. Soc. C.E., eldest son of F. E. Gibbs, Chief Grain Inspector, Western Division, Winnipeg, died in London, Eng., Dec. 28, aged 38, after an operation to remove an abscess near one of his ears. He graduated from the Royal Military College, Kingston, Ont., and at the time of his death was a member of the firm of McDonald, Gibbs and Co., engineers, London, Eng., who are building a railway in Chile. He was buried at Oshawa, Ont.

A. Shields, who has been appointed General Master Mechanic, Canadian Northern Ry., Winnipeg, and whose portrait appears in this issue, entered railway service in 1880, as apprentice, Credit Valley Ry. (now a part of the C.P.R.), Toronto, and from 1886 to 1901 was in the mechanical department, G.T.R., at Port Huron, Mich.; 1901 to 1903, locomotive foreman, C.P.R., and since 1903 he has been in C.N.R. service, latterly as Master Mechanic at Winnipeg.

J. M. Woodman, who has been appointed Superintendent of Winnipeg terminals, C.P.R., is a Canadian by birth, and in 1884 was employed by the C.P.R. as yard clerk at Winnipeg. From 1884 to 1886 he was in Hamilton and Northwestern Ry. service, Hamilton, Ont., since when he has spent the time in the United States, where he has been chiefly associated with the working of terminal yards at various points, mainly St. Louis and Chicago, latterly with the Indiana Harbor Belt Ry.

D. T. Main, who has been appointed Master Mechanic, Sasatchewan Division, C.P.R., Moose Jaw, and whose portrait appears in this issue, was born at Kirkintilloch, Scotland, and came to Canada in 1903, when he entered Mackenzie, Mann and Co.'s service as draughtsman, and in 1904 transferred to the C.P.R., and was, from 1907 to Mar., 1908, locomotive foreman, Minnedosa, Man.; Mar., 1908, to Mar., 1910, locomotive foreman, Cranbrook, B.C.; Mar., 1910, to Jan., 1912, District Master Mechanic, District 1, British Columbia Division, Nelson.

A. E. McMaster, whose appointment as General Agent, G.T.P. Ry., G.T.P. Coast Steamship Co., and G.T.R., at Prince Rupert, B.C., was announced in our last issue, was born at Perth, Ont., Oct. 22, 1885, and entered railway service early in 1903, since when he has been, to 1907, consecutively, clerk, C.P.R., Keewatin, Ont., and in various capacities in C.P.R. freight and ticket offices, Port Arthur, Ont., and chief clerk and acting agent there; Aug., 1907, to Sept., 1908, consecutively, chief clerk to Trainmaster and Locomotive Foreman, chief clerk to Superintendent, and agent, G.T.P.R., Fort William, Ont.; Sept., 1908, to Dec. 31, 1911, agent, G.T.P.R., Prince Rupert, B.C.

O. L. Dickeson, who has been elected President, White Pass and Yukon Route, Vancouver, B.C., was born at Ottumwa, Ia., Sept. 16, 1877, and entered railway service, Jan. 18, 1899, since when he has been, to 1901, stenographer in transportation department, Chicago, Burlington and Quincy Rd.; 1901 to 1905, chief clerk, same department, same road; 1905 to 1908, Superintendent of Transportation, lines west of Missouri River, same road, Omaha, Neb.; 1908 to

Apr. 24, 1911, Special Inspector of Transportation, same road, Chicago, Ill.; Apr. 24 to Dec. 31, 1911, Vice President, White Pass and Yukon Route, Vancouver, B.C., and since Sept., 1911, also General Manager, same company.

J. Kyle, who has been appointed Master Mechanic, Western Division, C.N.R., Edmonton, Alta., was born at Toronto, Apr. 11, 1877, and entered railway service in 1893, since when he has been, to Jan., 1899, apprentice and machinist, G.T.R. shops, Toronto, and Niagara Falls, Ont.; Jan., 1899, to Mar., 1902, machinist, C.P.R. shops, Winnipeg; Mar., 1902, to Jan., 1903, shop foreman, C.P.R. roundhouse, Winnipeg; Jan. to Feb., 1903, acting Locomotive Foreman, C.P.R., Winnipeg; Feb., 1903, to Jan., 1907, General Foreman of Shops, Canadian Northern Ry., Winnipeg; Jan. to Dec., 1907, Assistant Master Mechanic, same road, Winnipeg; Dec., 1907, to Jan., 1912, Assistant Master Mechanic, same road, Edmonton, Alta.

John Paul, who has been appointed District Freight Agent, C.N.R., Winnipeg, and whose portrait appears in this issue, was born in Euphrasia tp., Ont., Sept. 13, 1853, and entered railway service in Aug., 1879, since when he has been, to May, 1881, agent, Northern Ry., Creemore, Ont.; May, 1881, to Oct., 1883, agent, same road, Thornbury, Ont.; Oct., 1883, to Aug., 1885, in private business; Aug., 1885, to Apr., 1890, successively relieving operator, ticket clerk, G.T.R., St. Catharines and London, Ont.; Apr., 1890, to Feb., 1905, City Passenger and Ticket Agent, Michigan Central Rd., London, Ont., and from Nov., 1894, also City Freight Agent, same road; Mar., 1905, to Jan., 1912, General Freight and Passenger Agent, Niagara, St. Catharines and Toronto Ry., St. Catharines, Ont.

J. H. Guess who has been appointed General Purchasing Agent, G.T.R., Montreal, and whose portrait appears in this issue, was born at Raleigh, N.C., Feb. 5, 1878, and entered railway service in 1895, since when he has been, to May, 1900, telegraph operator, Seaboard Air Line Ry.; May, 1900, to Feb., 1901, clerk to Vice President and General Manager, Seaboard Air Line Ry.; Feb., 1901, to Mar., 1902, clerk to Vice President and General Manager, Atlanta, Birmingham and Atlantic Rd.; Mar., 1902, to Sept., 1905, Assistant General Purchasing Agent, National Ry. of Mexico, and in 1905, was also appointed Assistant Secretary-Treasurer, same road; Sept., 1905, to Sept., 1910, General Purchasing Agent, National Ry. of Mexico; Sept., 1910, to Jan. 1, 1912, Assistant General Purchasing Agent, G.T.R., Montreal.

In the New Year's list of honors conferred by the King, the following persons associated with Canadian transportation interests were included:—E. B. Osler, M.P. for West Toronto, director, C.P.R., President, Niagara Navigation Co., and director, St. Lawrence and Chicago Steam Navigation Co., knight bachelor; T. Skinner, director, C.P.R. and Dominion Atlantic Ry., and Deputy Governor, Hudson's Bay Co., London, Eng., baronet; Lt.-Col. Rodolphe Forget, M.P. for Charlevoix and Montmorency, Que., President, Richelieu and Ontario Navigation Co., and Quebec Ry., Light, Heat and Power Co., director, Toronto Ry. and Canadian General Electric Co., knight bachelor; Col. the Hon. J. M. Gibson, Lieut.-Governor of Ontario, formerly President, now director, Dominion Power and Transmission Co., Knight Commander of the Order of St. Michael and St. George.

Lieut. J. P. Dickson, who died at Ottawa, Jan. 4, was a son of M. C. Dickson, formerly District Passenger Agent, G.T.R., Toronto, later G.T.R. agent at Woodstock, Ont., and now Industrial Commissioner for the town of Wood-

stock. He was born at Bothwell, Ont., in 1874, and entered railway service in 1886, in the General Passenger Department, C.P.R., Montreal; 1887 to 1888, in Division Engineer's Office, C.P.R., Chatham, Ont., remaining in that de-

P252 G. H. Hedge,
Master Mechanic, Central Division, Canadian Northern Railway.

partment, as assistant, until the completion of the line from London to Windsor; 1891 to 1895, chief clerk to Superintendent, C.P.R., Ottawa; 1895 to 1906, Secretary, Canadian Railway Accident Insurance Co., Ottawa. He then

P253 D. T. Main,
Master Mechanic, Saskatchewan Division, Canadian Pacific Railway.

became interested in the Cobalt mining district. In 1900 he went to Europe, and later spent some time in New Mexico and Bermuda, but, on account of his illness, had eventually to give up business altogether.

G. H. Hedge, who has been appointed Master Mechanic, Central Division, C.N.R., Winnipeg, and whose portrait appears on this page, was born at Neath, Wales, May 26, 1865, and entered railway service in 1879, as machinist apprentice with the Great Western Ry., England. He came to Canada in 1884, since when he has been, from Mar., 1884, to 1890, fitter in C.P.R. shops at Ottawa, Schreiber, Montreal, Hochelaga, and again at Montreal, where he was leading hand; 1891 to 1893, Locomotive Foreman, C.P.R., Megantic, Que.; in 1893 he was transferred to Farnham, Que., and subsequently to Montreal; 1896 to 1901, General Locomotive Foreman, C.P.R., Farnham, Que.; 1901 to 1902, Locomotive Foreman, C.P.R., Medicine Hat, Alta.; 1902 to Jan., 1903, Locomotive Foreman, C.P.R., Brandon, Man.; Jan., 1903, to June, 1908, Locomotive Foreman, Canadian Northern Ry., Port Arthur, Ont.; June, 1908, to Jan., 1912, Assistant Master Mechanic, C.N.R., Winnipeg.

Matthew Neilson, M. Can. Soc. C.E., died in Montreal, Jan. 21, aged 59, of pleuro-pneumonia, and was buried at Kingston, Ont. He was born at Almonte, Ont., May 26, 1852, and from 1875 to 1877 was an apprentice with F. W. Nash, C.E., on construction and general office work on the Kingston and Pembroke Ry.; 1880, Resident Engineer of 13 miles and later transitman on location, Chicago, St. Paul, Minneapolis and Omaha Ry.; 1881 to 1885, Resident Engineer of 14 miles, C.P.R.; 1886, Resident Engineer of 14 miles, Minneapolis and Pacific Ry., and later in charge of the construction of 40 miles of the Winnipeg and Hudson's Bay Ry., and in 1887 appointed Division Engineer of the Atlantic and North West Ry. International extension. He was at one time Manager of the St. John, N.B., Railway, and afterwards Consulting Engineer, Montreal St. Ry. Latterly he has practiced as a consulting engineer, and was acting as Vice President and General Manager, Alberta Central Ry.

Ross Thompson, who has been appointed Chief Engineer, St. John and Quebec Ry., Fredericton, N.B., was born at Newry, Ireland, Jan. 1, 1865, and commenced his railway career in 1880, since when he has been, to 1882, roadman on construction, Limavady and Dunvigen Ry., county Derry, Ireland; 1882 to 1883, leveller on survey, Great American and European Short Line Ry., Pugwash to Pictou, N.S.; 1883 to 1886, Assistant to Division Engineer on construction, Lake Superior Division, C.P.R.; 1886 to 1888, Right of Way Agent and Paymaster on C.P.R. construction, Lachine to Sherbrooke, and through Maine; 1888 to 1889, transitman on location C.P.R. branches in Manitoba; 1889 to 1892, office manager on construction, Port Arthur, Duluth and Western Ry.; 1892 to 1899, Manager, Port Arthur, Duluth and Western Ry.; 1899 to 1900, in charge of tracklaying and ballasting, Canadian Northern Ry., Port Arthur westerly; 1900 to 1902, Trainmaster, Sydney and Louisburg Ry.; 1902 to 1909, in private practice, Sydney, N.S.; 1909 to Jan., 1912, Manager of Construction and Operation, Aroostook Valley Ry., Maine.

Michael McNamara, G.T.R. outside ticket agent and Great North Western Telegraph Co.'s agent at Walkerton, Ont., died there Dec. 31, age 70, of arterial sclerosis. He was born in County Clare, Ireland, came to Canada when 11 years old, and went to Walkerton 42 years ago. For some time he was in business as a jeweller. He was the G.N.W.T. Co.'s agent there for 42 years, and in 1882 was appointed outside ticket agent for the old Great Western Ry., when he was installed by E. de la Hooke, now Secretary of the Canadian Ticket Agents' Association, who was then on the Great Western Ry. General Passen-

Steam Railway Track Laid in 1911.

ger Agent's staff. In March, 1898, he was appointed G.T.R. outside ticket agent. He joined the Canadian Ticket Agents' Association in 1893, was its Second Vice President in 1900 and 1901, First Vice President in 1902, President in 1903 and 1904, and a member of the executive committee from 1907 until his death. In 1904 he represented the Association at the American Association of General Passenger and Ticket Agents annual meeting at Old Point Comfort, Va. He was a conservative and a Roman Catholic. Both he and Mrs. McNamara were regular attendants at the Association's annual meetings for many years. W. Jackson, Chairman, Executive Committee, represented the Association at the funeral. Mr. McNamara is the third ex-president of the C.T.A.A. who has died within the past twelve months, the other two being W. Bunton, Peterboro, and C. E. Morgan, Hamilton.

W. J. Camp, who has been appointed Assistant Manager of Telegraphs, C.P.R., Montreal, was born at Oakville, Ont., Apr. 22, 1855, and at about the age of 17 was engaged in the G.T.R. freight office at Prescott, Ont., where he learned telegraphy. He entered the Dominion Telegraph Co. service Sept., 1874, as operator, and took up the study of wire testing and switching. In 1875 he was moved to Montreal as bookkeeper same company, and in 1876 was appointed local manager same company at Watertown, N.Y. Leaving this service towards the end of the same year, he was engaged at various points on the New York Central and Troy and Boston Rys., and for the Western Union Telegraph Co. at Albany, N.Y., re-entering the Dominion Telegraph service at Montreal, in 1877, becoming night chief operator; Jan., 1878, appointed train dispatcher, Quebec, Montreal and Ottawa Ry., now a portion of the C.P.R., returning later to the Dominion Telegraph Co. as night chief operator, and on the consolidation of the Dominion and Montreal Telegraph Cos., was appointed assistant day chief operator; local electrician, same company, Montreal, until July, 1883; July, 1883, to Sept., 1884, operator, C.P.R., Hochelaga, Que.; Sept., 1884, to Apr., 1886, in private business; Apr., 1886, to Dec., 1889, Chief Electrician, C.P.R. Telegraphs, Montreal; Dec., 1889, to Nov., 1903, Superintendent of Telegraphs, Eastern Division, covering territory between Louisburg, N.S., and Port Arthur, Ont.; Nov., 1903, to Jan. 1, 1912, Electrical Engineer, C.P.R. Telegraphs. F. E. Camp, Inspector of Construction and Maintenance, C.P.R. Telegraphs, British Columbia Division, is his elder son.

The Railway to Hudson Bay.

A return was presented in the House of Commons Jan. 15, giving details of tenders submitted for the building of the Pas Mission-Split Lake section of the line. Tenders were received from four firms—three Canadian and one United States—each bidder submitting two prices based on slight variations in the work. The United States tender was ruled out on account of some irregularity, and the lowest, that of J. D. McArthur, Winnipeg, was accepted. The figures submitted by the three Canadian firms were:—
J. D. McArthur\$3,078,354 \$3,167,104
Northern Construction Co. 3,080,109 3,087,059
M. J. O'Brien 3,368,537 3,295,787

Niagara Fruit Growers Tramways Co. —Press reports state that the Ontario Legislature will be asked at the current session to incorporate a company with this title to build tramway lines in the Niagara Peninsula. Nothing has been disclosed as to the routes of the projected lines, or as to the interests behind the project.

In the particulars of steam railway track laid in 1911, published in our last issue, the figures for some of the lines were estimated. Complete returns have since been received in response to our requests and the revised figures are given below. They show some variations from those given in our last issue, but do not materially affect the totals on the different lines, while the actual mileage laid is increased from 1,827.33 to 1,851.98, which is about 18 miles under that laid in 1910. In some sections of the country tracklaying had to be suspended earlier than was anticipated, hence the alteration of the mileages which it was estimated would be laid on some of the C.P.R. lines, and a shortage of steel was experienced on Canadian Northern Ry. and G.T. Pacific Ry. branch lines. Following are the revised and complete figures:—

ALBERTA CENTRAL RY.—	
Red Deer to Red Deer River	7.00
ALGOMA CENTRAL AND HUDSON BAY RY.—	
Mileage 81.6 to 99.....	17.40
Mileage 153.0 to 115.....	38.00

	18.00
Total	1,851.98

Actual track laid in 1910 1,869.24
Of this mileage 1,609.65 miles were laid in connection with three systems, the following being a comparison of the mileage laid by the same lines in 1910 and 1911:—

	Miles.	Miles.
	1911.	1910.
Canadian North Eastern Ry...	11.00	
Canadian Northern Ontario Ry.	75.20	71.70
Canadian Northern Pacific Ry.	46.00	
Canadian Northern Ry.....	446.10	521.96
	578.30	593.66
Canadian Pacific Ry.....	465.20	286.58
National Transcontinental Ry...	280.25	312.00
Grand Trunk Pacific Ry....	254.00	309.00
	534.25	521.00

Total of the three systems 1,609.65 1,651.24
The remaining 242.33 miles were laid by 13 lines.

In addition to the new track laid on the Canadian Northern Ontario Ry.'s Toronto-Ottawa line, three miles of track were laid on a revision of location of the Bay of Quinte Ry. between Harrowsmith and Sydenham.

Divided by provinces the track laid during 1910 and 1911 compares as follows:—

	1911.	1910.
	Miles.	Miles.
Saskatchewan	630.74	518.84
Ontario	394.44	308.98
Alberta	392.10	365.63
British Columbia	216.00	117.80
Quebec	193.31	232.10
Manitoba	22.16	141.49
Nova Scotia	2.50	4.00
New Brunswick	0.73	180.40
	1,851.98	1,869.24

St. Lawrence and Adirondack Ry.—A dividend of 4% for the past year has been paid. The last previous dividend paid was in respect of 1908 and was also 4%. The stock is held by the New York Central Lines.

Oregon-Washington Rd. and Navigation Co.—A Vancouver dispatch, Jan. 18, says J. D. Farrell, President of the O.-W. Rd. and N. Co., has announced that it is intended to build a direct line from Seattle, Wash., to Vancouver, B.C. No statement was made as to when it is expected to start operations.

The cases against four clerks in the C.P.R. ticket office, Toronto, for forgery and theft in connection with rebates on unused portions of tickets, were disposed of Jan. 3, as follows:—B. A. Bennett, two years' imprisonment for forgery and theft; J. J. McPherson, three months in jail on similar charges; J. J. Adamson, forgery, dismissed on the ground that there was no intent to defraud, and R. Lalor was acquitted.

Transportation Appointments Throughout Canada.

Algoma Central and Hudson Bay Ry., Algoma Eastern Ry.—F. K. Allen has been appointed Purchasing Agent, vice W. G. Webber, appointed Purchasing Agent, Algoma Steel Co., and Lake Superior Iron and Steel Co. Mr. Allen is also Purchasing Agent, International Transit Co., Trans-St. Mary Traction Co., Lake Superior Power Co., Tagona Water and Light Co., and Algoma Commercial Co. Office, Sault Ste. Marie, Ont.

Canadian Northern Ry.—I. L. Healey, heretofore Contracting Freight Agent, Toronto, has been appointed Travelling Freight Agent, Toronto, vice R. A. Lennox, transferred to Hamilton, Ont.

C. H. Green, heretofore Contracting Freight Agent, Hamilton, Ont., has been appointed Contracting Freight Agent, Toronto.

R. Logan, heretofore in General Freight Agent's office, Toronto, has been appointed Contracting Freight Agent, Hamilton, Ont., vice I. L. Healey, transferred to Toronto.

R. A. Lennox, heretofore Travelling Freight Agent, Toronto, has been appointed Travelling Freight Agent, Hamilton, Ont.

T. Grimes, formerly General Yardmaster, Toronto terminals, C.P.R., has been appointed Yardmaster, C.N.R., Port Arthur, Ont., vice W. C. Turner, assigned to other duties at Winnipeg.

A. Shields, heretofore Master Mechanic, has been appointed General Master Mechanic, Office, Winnipeg.

A. C. Egan, heretofore Chief Travelling Auditor, Winnipeg, has been appointed Auditor of Agencies, on all lines west of Port Arthur, Ont., and all balance sheets and debit and credit papers and correspondence in connection therewith are addressed to him. Office, Winnipeg.

G. H. Hedge, heretofore Assistant Master Mechanic, Winnipeg, has been appointed Master Mechanic, Central Division. Office, Winnipeg.

John Paul, heretofore Freight and Passenger Agent, Niagara, St. Catharines and Toronto Ry., St. Catharines, Ont., has been appointed District Freight Agent, C.N.R., Winnipeg, vice J. B. Sheppard, resigned.

M. L. Flett, heretofore hotel clerk, has been appointed chief clerk, Sleeping, Dining and Parlor Car, Hotel and News Department, Winnipeg, vice W. W. Swinden, chief clerk and accountant, appointed Chief Accountant.

W. W. Swinden, heretofore chief clerk and accountant, has been appointed Chief Accountant, Sleeping, Dining and Parlor Car, Hotel and News Department, Winnipeg.

J. E. Hutchison has been appointed Manager, C.N.R. Prince Edward Hotel, Brandon, Man.

R. R. Marsales has been appointed Contracting Freight Agent, Brandon, Man., vice T. J. Peterson, resigned.

F. Creighton, heretofore assistant ticket agent at Saskatoon, Sask., has been appointed city ticket agent, Brandon, Man.

J. Kyle, heretofore Assistant Master Mechanic, Edmonton, has been appointed Master Mechanic, Western Division. Office, Edmonton, Alta.

Canadian Pacific Ry.—W. M. Godsoe, heretofore local manager, C.P.R. Telegraphs, Halifax, N.S., has been appointed Superintendent, Atlantic Division, C.P.R. Telegraphs, vice F. J. Mahon, transferred to Montreal. Office, St. John, N.B.

D. L. Jones, heretofore District Master Mechanic, Brownville Jct., Me., has been appointed District Master Mechanic and Trainmaster, District 2, Atlantic Division. Office, Woodstock, N.B.

A. Williams, heretofore Trainmaster at Woodstock, N.B., has returned to his former position as Chief Dispatcher there.

W. F. Grant has been appointed District Master Mechanic, Brownville Jct., Me., vice D. L. Jones, transferred to Woodstock, N.B.

W. F. Hackman, heretofore Resident Engineer, Schreiber, Ont., has been appointed Resident Engineer, Brownville Jct., Me., vice F. B. Tapley, acting Resident Engineer, appointed Resident Engineer, London, Ont., as announced in our last issue.

It is persistently rumored that F. P. Gutelius, M. Can. Soc. C.E., General Superintendent, Eastern Division, will receive an important appointment in connection with the Dominion Government Railways. An Ottawa press dispatch, Jan. 26, says he will be appointed, in conjunction with G. Lynch Staunton, K.C., of Hamilton, Ont., to investigate the circumstances attending the construction of the National Transcontinental Ry.

John Corbett, General Foreign Freight Agent, Montreal, is reported to have resigned to go into general insurance brokerage business, particularly marine insurance, under the style of John Corbett and Co., Ltd.

S. Houghton has been appointed Chief Inspector of Time Service, vice J. J. F. Houghton, resigned. Office, Montreal.

E. P. Flintoft and Jas. McNaught have been appointed Assistant Solicitors at Montreal.

W. A. Cowan, formerly Resident Engineer at Farnham, Que., has been appointed one of the assistant engineers in the Assistant Chief Engineer's office, Montreal, and not Inspecting Engineer, as previously mentioned. This appointment, which was mentioned in our last issue, was misplaced. It should have appeared under the heading of Canadian Pacific Ry., instead of Canadian Northern Ry.

J. G. Galley, heretofore chief rate clerk, Import Freight Agent's office, Montreal, has been appointed Contracting Import Freight Agent, Atlantic Steamship Lines, vice A. T. Shaughnessy, resigned to go into financial business. Office, Montreal.

W. J. Camp, heretofore Electrical Engineer, C.P.R. Telegraphs, has been appointed Assistant Manager, C.P.R. Telegraphs. Office, Montreal. The position of Electrical Engineer has not yet been filled.

J. Fletcher, heretofore Superintendent, C.P.R. Telegraphs, British Columbia Division, Vancouver, has been appointed Superintendent of Traffic. Office, Montreal.

D. H. Bowen, heretofore local manager, C.P.R. Telegraphs, London, Ont., has been appointed Assistant Superintendent, Ontario Division C.P.R. Telegraphs. Office, Toronto.

C. W. MacDonald, heretofore assistant night chief operator, Toronto, has been appointed local manager, C.P.R. Telegraphs, London, Ont., vice D. H. Bowen, promoted.

J. M. Woodman, Chicago, Ill., has been appointed Superintendent of Winnipeg Terminals, vice J. McLellan, who has been granted indefinite leave of absence on account of continued ill health.

W. E. Woodhouse, heretofore Superintendent of Shops, Winnipeg, has been appointed Assistant Superintendent of Motive Power, Western Lines, vice C. H. Temple, recently appointed Superintendent of Motive Power and Car Department, Western Lines. Office, Winnipeg.

R. A. Pyne, heretofore Master Mechanic, Alberta Division, Calgary, has been appointed Superintendent of Shops, Winnipeg, vice W. E. Woodhouse, promoted.

W. R. Rutherford, heretofore local manager, C.P.R. Telegraphs, Winnipeg, has been appointed Supervisor, C.P.R. Telegraphs, Souris, Man.

W. D. Neil, heretofore chief clerk to Superintendent, C.P.R. Telegraphs, Alberta Division, Calgary, has been appointed local manager, C.P.R. Telegraphs, Winnipeg, vice W. R. Rutherford, promoted.

W. Kennedy, heretofore agent, C.P.R. Telegraphs, Regina, Sask., has been appointed assistant city representative, Winnipeg.

W. K. Thompson, heretofore agent, C.P.R. Telegraphs, Saskatoon, Sask., has been appointed chief operator, C.P.R. Telegraphs, Winnipeg, vice W. J. Kane, promoted.

W. J. Kane, heretofore chief operator, C.P.R. Telegraphs, Winnipeg, has been appointed Supervisor, C.P.R. Telegraphs, Winnipeg.

J. McAnany, heretofore Road Foreman of Locomotives, District 3, Alberta Division, Macleod, has been appointed District Master Mechanic, District 3, Saskatchewan Division, vice T. Patterson, assigned to other duties. Office, Saskatoon.

D. T. Main, heretofore District Master Mechanic, District 1, British Columbia Division, Nelson, has been appointed Master Mechanic, Saskatchewan Division, vice A. T. Shortt, transferred. Office, Moose Jaw.

A. T. Shortt, heretofore Master Mechanic, Saskatchewan Division, Moose Jaw, has been appointed Master Mechanic, Alberta Division, vice R. A. Pyne, promoted. Office, Calgary.

G. Moth, heretofore acting District Master Mechanic, Medicine Hat, Alta., has been appointed Road Foreman of Locomotives, District 3, Alberta Division, Macleod, vice J. McAnany, promoted.

R. F. Richardson, heretofore chief clerk to Local Freight Agent, Calgary, Alta., has been appointed Local Freight Agent there, vice T. F. English, resigned on his appointment as collector of customs, Calgary.

W. J. Meakin, heretofore charge hand, Strathcona roundhouse, has been appointed Locomotive Foreman, Castor, Alta., vice J. Jenson, assigned to other duties in the Car Department.

M. J. Scott, heretofore locomotive engineer, District 1, British Columbia Division, Revelstoke, has been appointed District Master Mechanic, District 3, British Columbia Division, vice D. T. Main, promoted. Office, Nelson.

W. Pimlott, heretofore Storekeeper, Field, B.C., has been appointed Storekeeper at Nelson, B.C., vice J. W. Cormode, appointed chief clerk to Divisional Storekeeper at Calgary, Alta.

Jas. Osborne, General Superintendent Ontario Division, Toronto, is to be transferred to Vancouver, B.C., as General Superintendent, British Columbia Division, and will remain there about the middle of February.

Duluth, Rainy Lake and Winnipeg Ry.—J. Conery, heretofore dispatcher, has been appointed Chief Dispatcher, Virginia, Minn., vice C. W. Houston, appointed Superintendent.

Grand Trunk Pacific Coast Steamship Co.—F. Waterhouse has been appointed Manager, G.T. Pacific Dock, Seattle, Wash.

J. J. Carroll, heretofore Superintendent, G.T. Pacific Dock, Seattle, Wash., has been appointed agent, G.T.P. Coast Steamship Co., and the former position has been abolished. Office, 130 G.T.P. Dock, Seattle, Wash.

Grand Trunk Pacific Ry.—A. W. Larmour has been appointed Travelling Freight Agent. Headquarters, Winnipeg.

H. E. Bissell, heretofore Assistant Right of Way and Claims Agent, has been appointed Right of Way and Claims Agent, vice G. H. Pope, superannuated. Office, Winnipeg.

J. B. Shelton has been appointed Car Foreman at Transcona, Man., vice J.

Flynn, transferred to Edmonton, Alta.

R. W. Gibson has been appointed agent at Cabot, Man.

A. Bell, heretofore Locomotive Foreman, Wainwright, Alta., has been appointed Locomotive Foreman, Transcona, Man., vice R. Gardiner, assigned to other duties.

G. E. Brooks has been appointed Locomotive Foreman at Wainwright, Alta., vice A. Bell, transferred.

J. Flynn, heretofore Car Foreman at Transcona, Man., has been appointed Car Foreman at Edson, Alta.

T. C. Chalmers has been appointed Agent at Prince Rupert, B.C., vice A. E. McMaster, appointed General Agent, as announced in our last issue.

Grand Trunk Ry.—C. M. Hays, President, issued the following circular Jan. 1: "It is with great regret that I announce the retirement of A. Butze, General Purchasing Agent, under provisions of the pension fund. Mr. Butze since his connection with this company for the past 16 years, has filled the important position he held with exceptional faithfulness and fidelity, and his friends and associates among officers and employees of the company, as also others who know him, will I am sure join me in the earnest wish that he may have many years of well earned rest."

J. H. Guess, heretofore Assistant General Purchasing Agent, has been appointed General Purchasing Agent, vice A. Butze, retired. Office, Montreal.

R. Johnson, heretofore chief clerk, Stores and Purchasing Departments, has been appointed Assistant General Purchasing Agent, vice J. H. Guess, promoted. Office, Montreal.

The following agents have been appointed:—Trenton, Ont., A. J. Adams; North Bay, Ont. (freight), W. A. McCutcheon; Hamilton, Ont. (Stuart St. pass.), P. A. Robertson; Burford, Ont., C. S. Kerton; Barrys Bay, Ont., F. O. Parent (relieving).

Hudson Bay Ry.—J. P. Gordon, Winnipeg, is reported to have been appointed Assistant Chief Engineer of the Dominion Government railway from Pas Mission, Sask., to Hudson Bay.

Intercolonial Ry.—W. A. Dube, Superintendent at Levis, who has been under suspension, as mentioned in our last issue, has been dismissed. The charges of political partisanship were not sustained, but the commissioner appointed by the Minister of Railways to make the investigation reported that charges of personal misconduct had been proved.

J. S. Leighton, Claims Agent, and F. X. Talbot, lost freight tracer, Moncton, N.B., have been dismissed.

Lehigh Valley Rd.—W. T. Grier has been appointed General Coal and Freight Agent. All correspondence and reports relating to coal and coke traffic should be forwarded to him, and he will also have charge of such other traffic or assume other duties as may hereafter be assigned to him. Office, 143 Liberty St., New York.

S. A. Story has been appointed Through Freight Agent. Office, Buffalo, N.Y.

Minneapolis, St. Paul and Sault Ste. Marie Ry.—W. R. Sheldon, General Agent, Helena, Mont., is reported to have been appointed District Freight and Passenger Agent, Calgary, Alta.

National Transcontinental Ry.—The Minister of Railways has introduced a bill in the House of Commons to abolish the commission of four members, which has hitherto administered the affairs connected with construction, and to vest all the powers in one commissioner. This will place the whole work under the present Chairman, R. W. Leonard, M. Can. Soc. C.E.

The position of Purchasing and Right of Way Agent, District F., Winnipeg, hitherto held by T. L. Morton, is reported to have been abolished on the ground

that it is no longer a necessity for that district.

New York Central Lines.—Carl Howe, in addition to his duties as Manager of the N.Y.C. fast freight lines, has been given jurisdiction over all the outside agencies located at points off or beyond N.Y.C. lines.

R. J. Ross has been appointed Commercial Agent of the New York Central and Hudson River Rd., West Shore Rd., Boston and Albany Rd., Pittsburg and Lake Erie Rd., Cleveland, Cincinnati, Chicago and St. Louis Ry., Lake Shore and Michigan Southern Ry., Michigan Central Rd., Chicago, Indiana and Southern Rd., Lake Erie and Western Rd., Toledo and Ohio Central Ry., Zanesville and Western Ry., New York and Ottawa-Ottawa and New York Rys., Merchants Despatch, Merchants Despatch-Dairy Line, Red Line, White Line, Blue Line, Canada Southern Line, West Shore Line, Nickel Plate Line, North Shore Despatch, Jersey Central-Lake Shore Despatch, Jersey Central-Michigan Central Despatch, Rutland-Michigan Central Line. Office, Bank of Nova Scotia Building, Winnipeg.

C. H. Hogan has been appointed Assistant Superintendent of Motive Power, Eastern District, Hudson, Harlem, New York and Poughkeepsie, River, Mohawk and Adirondack Divisions. Office, Albany station, N.Y.

A. J. Fries has been appointed Assistant Superintendent of Motive Power, Western District, Buffalo, Rochester, Western Ontario, St. Lawrence and Pennsylvania Divisions. Office, Depew, N.Y.

L. H. Raymond has been appointed Superintendent of Shops, West Albany, N.Y.

H. Wanamaker has been appointed Superintendent of Shops, Depew, N.Y.

The positions of District Superintendent of Motive Power at West Albany and Depew have been abolished.

Pere Marquette Rd.—J. E. Williams having resigned as Assistant General Freight Agent, to accept service on the Uniform Classification Committee, the duties of his office will be assumed by the General Freight Department, under the immediate direction of R. P. Paterson, Assistant General Freight Agent.

A. H. Greenly has been appointed Chief of Tariff Bureau, in charge of the compilation and publication of tariffs, reporting to the Assistant General Freight Agent. Office, Detroit, Mich.

F. G. Bement, heretofore Trainmaster, G.T.R., Durand, Mich., has been appointed Inspector of Transportation, P.M. Rd. Office, Detroit, Mich.

Quebec Ry., Light and Power Co.—A circular issued by Sir Rodolphe Forget, President, Quebec, Ry., Light, Heat and Power Co., announces that H. G. Matthews, heretofore Assistant to the President, has also been appointed General Manager, vice C. E. A. Carr resigned. Another circular issued by W. G. Ross, President Quebec Ry., Light and Power Co. announces that Mr. Matthews has been appointed to a similar position in that company. The Quebec Ry., Light, Heat and Power Co. is the holding company, the railways being operated by its subsidiary the Quebec Ry., Light and Power Co.

Reid Newfoundland Co.—The position of Chief Engineer has become vacant by the death of G. H. Massy, M. Can. Soc. C.E.

E. J. Hoskins has been appointed Assistant to the Superintendent. Office, St. John's.

St. John and Quebec Ry.—Ross Thompson, heretofore Manager of Construction and Operation, Arroostook Valley Ry., has been appointed Chief Engineer, St. J. and Q.R. Office, Fredericton, N.B.

Thousand Islands Ry., Oshawa Ry.—H. W. Cooper, heretofore chief clerk,

Treasurer's Department, G.T.R., Montreal, has been appointed Secretary and Treasurer, T.I. Ry. and O. Ry., vice C. A. Milliner, resigned. Office, Deseronto, Ont.

Wabash Rd.—F. H. Wegener, heretofore Travelling Freight and Passenger Agent, Seattle, Wash., has been appointed General Agent, Seattle, Wash., vice W. D. Stubbs, resigned to engage in other business.

White Pass and Yukon Route.—O. L. Dickeson, heretofore Vice President and General Manager, has been elected President, vice S. H. Graves, deceased. Office, Vancouver, B.C., in summer, and Chicago, Ill., in winter.

Railway Finance, Meetings, Etc.

Alberta Ry. and Irrigation Co.—The company's railway, coal mines, lands and other properties passed under the control of the C.P.R. Jan. 1. The C.P.R. acquired the whole of the outstanding common stock of the company at 150, and under the terms of the lease will pay as rental an amount sufficient to pay a dividend of 6% on the common stock, and the interest on the outstanding debenture stock.

Notice is given that the London, Eng., share register was permanently closed on Dec. 31, and that in future any transfers must be forwarded, together with the stock certificates, to the Bank of Montreal, London, for transmission to the Royal Trust Co., Montreal, who are the registrars of the company in Canada, for the issuance and return to the owners of new certificates with endorsement thereon of the Canadian Pacific Ry. Co.'s guarantee of interest at the rate of 6% per annum, payable July 1 and Jan. 1 in each year, as provided by the agreement of lease and sale to the C.P.R. Co.

Atlantic, Quebec and Western Ry.—Respecting the conviction of A. W. Carpenter, in connection with the failure of the Charing Cross Bank, London, Eng., which was chiefly concerned in the financing of this railway, it is stated, that British investors are interested in the 5% first mortgage bonds issued in 1906, of which \$325,500 was issued to contractors. Interest has been regularly paid, and it is stated that the subsidies, when received, will be deposited with the trustees for the debenture holders, and should be sufficient to meet the interest until Dec. 31, 1915. The bonds are not quoted on the London Stock Exchange, but transactions have recently taken place at about 10% discount. The issue prices were 96 and 98.

Brockville, Westport and Northwestern Ry.—Mackenzie, Mann and Co. have been directed to pay into court in Toronto \$8,972 to the credit of eight unknown bondholders in connection with the purchase of the railway. As Mackenzie, Mann and Co. were already holders of all the bonds of the company except the eight in question, an order was made dispensing with the payment into court of the rest of the purchase money.

Canadian Pacific Ry.—A cablegram of Jan. 4 says application has been made to the London, Eng. Stock Exchange for the listing of £1,000,000 of non-cumulative 4% preferred stock, and £1,000,000 of consolidated 4% debenture stock.

Dominion Atlantic Ry.—Passenger earnings for Dec., 1911, \$51,200; freight earnings, \$62,400; total, \$113,600; against \$85,700 total for Dec., 1910.

Grand Trunk Pacific Ry.—Application is being made to the Dominion Parliament for authority to make a further issue of perpetual or terminable debenture stock not exceeding in the whole £5,000,000, the proceeds to be applied to the completion of the company's main and branch lines, and the purchase of rolling stock.

Grand Trunk Railway.—The Dominion Parliament is being asked to authorize the company to acquire or otherwise deal with the first mortgage bonds issued by the G.T. Western Ry., not exceeding \$30,000,000; to aid or assist other companies in various ways in the name of the G.T.R. or the G.T. Pacific Ry., or in the name of trustees for the benefit of either of them; and for these purposes to issue further G.T.R. consolidated 4% debenture stock to an amount the interest upon which shall not exceed £250,000.

Quebec Central Ry.—Gross earnings for Nov., 1911, \$112,294; expenses, \$78,131.30; net earnings, \$34,162.70, against \$85,619.02 gross earnings; \$59,140.29 expenses; \$26,478.73 net earnings for Nov., 1910. Aggregate gross earnings for five months ended Nov. 30, 1911, \$622,557.07; expenses, \$401,572.57; net earnings, \$220,984.50, against \$549,486.71 aggregate gross earnings; \$353,733.31 expenses; \$195,753.40 net earnings for same period 1910.

Temiscouata Ry.—Gross earnings for Nov., 1911, \$16,417.31; expenses, \$13,583.64; net earnings, \$2,833.67.

Victoria and Sidney Ry.—Press reports from Victoria, B.C., state that the V. and S. Ry. is likely to pass into the hands of the Canadian Northern Ry. interests. The line is at present owned by the Great Northern Ry.

White Pass and Yukon Ry.—Aggregate gross earnings from Jan. 1 to Dec. 14, 1911, \$1,063,220, against \$1,194,370 for same period 1910.

The Kent Northern Railway Changes Ownership.

The Kent Northern Ry. has been sold to a Toronto syndicate, which has already taken possession. The syndicate is headed by Sir Henry M. Pellatt, stock broker, and Thos. Walmsley, insurance agent, etc., Toronto, who hold the control between them, the syndicate having acquired practically all the capital stock. The syndicate is said to have had an option on the property for several years, and to have paid amounts on account from time to time, the balance having been paid towards the end of last year. The purchase price is said to have been about \$115,000, which is said to include a mortgage of about \$50,000 on the property. The new proprietors contemplate establishing steamship connection with Prince Edward Island, and also developing gravel pits which they own about three miles from the junction with the Intercolonial Ry.

The line was built in the early eighties, and extends from Kent Jct., on the Intercolonial Ry., to Richibucto, N.B., 27 miles. The Commissioners appointed in 1909 by the Dominion Government to investigate the branch lines connecting with the Intercolonial Ry. reported that the line runs through a flat country, sloping towards Northumberland Strait, the maximum gradient being 1.5%, except in the case of a few local sags of a few hundred feet in length; there are a few curves, and these are of ample radius. The track is laid with 56 lb. rails bought from the Intercolonial Ry., and the largest bridge structure has a 16 ft. span. The Commissioners mentioned various works necessary to bring the line up to a standard which would permit its being taken over as a branch line. In addition to the station buildings there is a three stall enginehouse at Richibucto. The rolling stock consists of two locomotives, one passenger car, one combination freight and express car and two snow ploughs.

For the first 20 years of its existence the railway was managed by J. C. Brown, the principal stockholder. About the end of 1902 the line was sold to a

local syndicate consisting of T. O. Murray, R. Phinney, W. D. Carter, J. Jardine and G. M. Robertson, and a new act of incorporation was obtained from the New Brunswick Legislature. Until the sale to the new syndicate the officers of the company have been: President, J. Jardine; General Manager, T. O. Murray; Secretary, R. Phinney; Treasurer, W. S. Carter. It is stated that T. O. Murray will remain as Manager.

Subsequent to building the K.N. Ry., the Richibucto and St. Louis Ry. was built. This line is an extension of the K.N. Ry., from Richibucto to St. Louis, seven miles. It was operated for some time under lease by the K.N.R., but fell into bad repair, and on the bridge over the Kouchibouguacis River becoming unsafe, its operation was abandoned. The Dominion Government Commissioners' report says: "This line could be operated in connection with the K.N. Ry. at very small cost, and would give accommodation to a population (2,000) now deprived of it."

The Dominion Government report shows the capital of the Kent Northern Ry. outstanding at \$75,000, with \$50,000 of bonds, and that of the Richibucto and St. Louis Ry. at \$20,000, with no bond issue. Bonuses in aid of the building of the K.N. Ry. were voted as follows: \$58,334.27, including the value of used rails, from the Dominion Government; \$135,000 from New Brunswick, and \$5,000 from municipalities; while there was paid to the R. and St. L. Ry. \$22,400 by the Dominion Government, and \$21,000 by the New Brunswick Government. The net earnings of the K.N. Ry. during each year for the year ending June 30, 1906, to June 30, 1910, have been as follows: \$8,075, \$6,664, \$8,191, \$4,792, and \$6,056. The figures for the year ended June 30, 1911, are not yet available.

National Transcontinental Railway Construction, Etc.

The Minister of Railways stated in the House of Commons, Jan. 12, that the three members of the Commission for the building of the transcontinental railway, appointed by the late Government, C. A. Young, C. F. McIsaac and W. S. Calvert, had been asked to resign, and that the positions would not be filled. The Government proposed to have the act appointing the commission amended to suit its new policy, and to place the whole work in charge of the present Chairman, R. W. Leonard, M. Can. Soc. C.E.

Grand Trunk Pacific Railway Construction, Etc.

C. M. Hays, President, and W. Wainwright, Second Vice President, interviewed members of the Government at Ottawa Jan. 8, when, it is said, that the whole situation connected with the financing of the balance of the construction of the line between Winnipeg and Prince Rupert was considered, and the question of the operation of the Moncton-Winnipeg section discussed. It is said that a further loan, probably amounting to \$15,000,000, was asked for.

E. J. Chamberlin, Vice President and General Manager, returned to Winnipeg Jan. 13, from Montreal, and in an interview, gave details of construction projected for the current year, stating that the work would involve an expenditure of about \$20,000,000. He has been advised by the Chief Engineer that the boring of the tunnels in the Kitselas district has been completed, which will enable track to be laid during the year to 185 miles easterly from Prince Rupert. It is expected also that 150 miles of

track will be laid westerly from Tete Jaune Cache during the year, leaving about 200 miles of the main line to be completed in 1913. The only difficulty in the way of accomplishing this is the obtaining of sufficient men. During 1911 there were over 10,000 men engaged in construction on the main line, and it is hoped to have that number increased during the current year. While it is expected to have track laid through to the coast by the end of 1913, it is not expected to have the line in operation until some time in 1914.

The section of the line west of Tete Jaune Cache, which it is hoped to complete during the coming year, extends from the Cache to Fort George, B.C., and on this mileage sub-contracts are reported to have been let as follows:—H. E. Carleton and Co., Edmonton, 25 miles westerly from the Cache; Burns, Jordan and Co., Spokane, Wash., the next 50 miles; Sims Bros. and Keary, St. Paul, Minn., 75 miles.

In an interview at Victoria, Jan. 11, D'Arcy Tate, K.C., the company's solicitor at Winnipeg, is reported as having stated that he had just returned from Prince Rupert after ratifying the contract for the last section of the line between Tete Jaune Cache and Aldermere, B.C. Instructions had been given that the work was to be pushed with all possible dispatch, and he was satisfied that he was quite within the mark when he said that the line would be completed by the end of 1913.

As to branch line construction it is hoped during the summer to link up the main line with Brandon, Moose Jaw, Calgary, Lethbridge, Prince Albert and Battleford. Regina was linked up in the fall of 1911, and it is proposed to provide terminal accommodation, and to build a large hotel there during the current year. The extension of the line from Regina to the International boundary is expected to be completed this year. A considerable amount of grading had been done on the branch lines, and more steel would have been laid during 1911 but for the fact that the rails ordered could not be delivered, the deliveries being some 18,000 tons short. If the company can get the necessary rails it is hoped to lay 600 miles of track on branch lines this year. The following gradings are ready for tracklaying:—Hart-Brandon branch, 20 miles; Regina to International boundary, 143 miles; Regina to Moose Jaw, 56.5 miles; Moose Jaw northwesterly, 57.6 miles; Prince Albert branch, 51 miles; Battleford branch, 57 miles; Cutknife branch, 50 miles; Biggar-Calgary branch, 60 miles completely and 40 miles partially graded; Tofield-Calgary line, 94 miles; Brazeau coal branch, 23 miles. Further grading will be done on these lines, and it is expected to let a contract at an early date for the grading of a line from Calgary to Lethbridge, about 150 miles.

A very complete, illustrated description of the Prince Rupert marine terminal, dry dock, ship repairing plant, etc., is given in the Marine Department, further on in this issue.

Canadian Railway Club.—The tenth annual dinner was held in Montreal, Jan. 19, A. A. Goodchild, President, in the chair. The speakers to the various toasts included the President, the Minister of Railways, H. H. Vaughan, F. P. Gutelius, W. McNab, G. H. Ham, F. Gardiner, N. Curry, President of the Canadian Car and Foundry Co., and Professors McLeod and McKay of McGill University. The club, which was organized with less than 100 members, now has over 800.

The International Railway Fuel Association's fourth annual convention will be held at the Hotel Sherman, Chicago, Ill., May 22-25. T. Duff Smith, Fuel Agent, Grand Trunk Pacific Ry., Winnipeg, is President.

Orders by the Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers, are those on which the hearing took place and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

15628. Dec. 15.—Approving Alberta Central Ry. location from mileage 100 to 140, west of Red Deer.

15629. Dec. 20.—Authorizing G.T.P.R. to operate trains over overhead crossing of C.N.R. in sec. 14, tp. 53, r. 24, w. 4 m.

15630. Dec. 12.—Extending until Feb. 1, 1912, time for installation of power brakes on electric cars by Hull Electric Co.

15631, 15632. Dec. 18, 15.—Authorizing C.P.R. to build spurs for A. E. Burns, near Henry Ave., Winnipeg, and Rock Springs Sootless Coal Co., near Elcan ballast pit spur, Alta.

15634. Dec. 20.—Approving Esquimalt and Nanaimo Ry. location from Black Creek to near Duncan's Bay, Vancouver Island, B.C.

15635. Nov. 21.—Ordering that supplement to Canadian Classification 15 be issued reducing carload rating of marconi, spaghetti and vermicelli, from 4th to 5th class to become effective not later than Jan. 13, 1912, on application of Montreal Board of Trade Transportation Bureau.

15633. Dec. 16.—Authorizing C.N.O.R. to use for construction purposes only C.P.R. crossing at Chaudiere Jct., near Ottawa, until June 1, 1912, pending completion of interlocker.

15636, 15637. Dec. 13.—Ordering that Washash Rd. and G.T.R. install gates at Manitoba St., St. Thomas, Ont., before May 1, 1912; also electric bell at St. George St., Chatham, Ont., before Feb. 1, 1912, 20% to be paid from railway grade crossing fund in each case.

15638. Dec. 16.—Extending to June 1, 1912, time for installation of interlocking plant at crossing of C.P.R. and G.T.R. by C.N.O.R., near Ottawa.

15639. Dec. 19.—Relieving C.N.R. from further protection at crossing east of switch at Dauphin, Man.

15640, 15641. Dec. 20.—Authorizing C.N.R. to build across public road and two highways on its Maryfield extension, Sask.

15642. Dec. 20.—Authorizing C.N.R. to cross and divert highway on its Rossburn line, Sask.

15643 to 15645. Dec. 20.—Approving revised location of C.N.O.R. Montreal-Port Arthur line through Ross tp., through unsurveyed territory in Algoma district, mileage 148 to 166 from Sudbury Jct., and through Loughborough tp.

15646 to 15649. Dec. 20.—Authorizing C.P.R. to build spurs for Carbon Oil Co., Rosser, Man.; city of Moose Jaw, Sask.; Continental Oil Co., Lethbridge, Alta., and Eley Bros., near Woods, Man.

15650. Dec. 21.—Amending order 15594 of Dec. 12, 1911, re Esquimalt and Nanaimo Ry. by striking out words "Canadian Pacific Railway Company."

15651, 15652. Dec. 20.—Authorizing T.H. and B.R. to operate two spurs into premises of Laidlaw Bale Tie Co., and Canadian Drawn Steel Co., Hamilton, Ont.

15653. Dec. 20.—Approving G.T.R. plans for new station at Exeter, Ont.

15654. Dec. 16.—Ordering that upon conveyance by Petrolea Waggon Co., Petrolea, Ont., of land necessary, an interchange track be built by G.T.R. or M.C.R., cost to be divided equally between companies.

15655. Dec. 20.—Authorizing city of Fort William, Ont., to widen Victoria Ave. by 14 ft. across C.N.R. at Vickers St.

15656. Dec. 20.—Ordering C.P.R. to submit plans for station at Dysart, Sask., by April 1, 1912.

15657. Dec. 13.—Authorizing British Columbia Electric Ry. to cross C.P.R. at foot of Twelfth St., New Westminster.

15658. Dec. 21.—Approving location of C.N.R. station at Veregin, Sask.

15659. Dec. 19.—Extending to Apr. 1, 1912 time for C.P.R. and C.N.R. to file freight tariffs to apply between Fort William, Port Arthur and points east thereof, and Regina, Moose Jaw and other western points, as required by order 12520, Dec. 10, 1910.

15660. Dec. 20.—Authorizing C.P.R. to build spur for T. Kinnear and Co., Peterboro, Ont.

15661. Dec. 22.—Ordering T.H. and B.R. to maintain light on electric bell at Mohawk Road crossing, Brantford, Ont., and then

relieving company of speed limitations there.

15662. Dec. 21.—Relieving C.P.R. from further protection at crossing between Makaroff and Togo, Sask.

15663 to 15666. Dec. 21, 22.—Approving location of C.N.O.R. station grounds at Lombardy, Perth Road, Loughborough tp., Elgin and Bedford.

15667. Dec. 15.—Authorizing G.T.R. to build spur for St. Marys Portland Cement Co., and Horse Shoe Quarry, Blanchard tp., Ont.

15668. Dec. 21.—Extending to Jan. 31, 1912, time for G.T.R. to complete overhead bridge in lieu of subway at Queen St., Palmerston, Ont., as required by order 14164, June 24.

15669. Dec. 16.—Authorizing G.T.R. to build bridges at Mill, Peter, Barrett, and Ontario Sts., Port Hope, Ont.

15670. Dec. 16.—Ordering payment of taxed costs to W. H. Miles by G.T.R., re taking of lands at Etobicoke tp., Ont.

15671. Dec. 22.—Authorizing G.T.R. to build track on east side of Metcalf St., Simcoe, Ont.

15672. Dec. 22.—Amending order 14606, Aug. 21, 1911, par. 4, re interswitching at Brandon, Man., \$2 a car to be revenue of Brandon, Saskatchewan and Hudson Bay Ry. on empties transferred between C.P.R. and C.N.R.

15673. Dec. 22.—Approving location of C.N.R. at Cushing, Que.

15674. Dec. 23.—Approving location of South Ontario Pacific Ry. (C.P.R.) station at Watertown, Ont.

15675. Dec. 23.—Relieving G.T.R. from further protection of first crossing west of Port Robinson, Ont.

15676. Dec. 22.—Authorizing C.N.O.R. to cross and divert public road between cons. 1 and 2, South Elmsley tp.

15677. Dec. 23.—Approving location of C.N.O.R. through Chisholm and Ferris tps., mileage 325.23 to 343.55 from Montreal.

15678. Dec. 16.—Amending order 15151, Oct. 12, re erection of gates by G.T.R., at Royce Ave., Toronto, by providing that they be put outside C.P.R. track, and that new plan be filed.

15679. Dec. 23.—Authorizing C.P.R. to cross highway at mileage 202.77 with its Moose Jaw Northwesterly branch, Sask.

15680. Dec. 26.—Authorizing C.P.R. to open for freight traffic its line from Coldwater to Bethany, mileage 12.2 to 88.2, Ont.

15681. Dec. 26.—Authorizing C.P.R. to rebuild bridge 127.2, Mountain subdivision, British Columbia Division.

15682. Dec. 26.—Authorizing C.P.R. to open for traffic its second track, Moose Jaw subdivision, from Moose Jaw to Pasqua, mileage 127.68 to 134.43, Sask.

15683. Dec. 23.—Recommending to Governor in Council for approval, G.T.R. Transportation Department rules.

15684. Dec. 26.—Extending to June 30, 1912, time for completion by Toronto Eastern Railway of spurs for Durham Rubber Co., Bowmanville, Ont.

15685. Dec. 23.—Ordering Central Vermont Ry. to ballast its entire line between St. Lambert and Waterloo, Marieville and St. Cesaire, Farnham and Frielsburg, and Iversville and Farnham, and to repair all bridges, farm and highway crossings, and fences, ballast to be 6 ins. lift; work to be completed by Oct. 1, 1912, and that within 30 days from date of order, frogs and guard rails be filed, under penalty of \$25 a day.

15686, 15687. Dec. 27.—Authorizing C.P.R. to rebuild bridge 127.2, Mountain subdivision, British Columbia Division, and 94.8, over Wascana Creek, Moose Jaw subdivision, Saskatchewan Division.

15688. Dec. 27.—Authorizing C.P.R. to build spur for Park Fuel and Lumber Co., Calgary, Alta.

15689 to 15691. Dec. 27, 23.—Approving location of C.N.O.R. through unsurveyed territory in Algoma District, mileage 287 to 327, from Sudbury Jct., and approving revised location through Alice, Fraser and Richards tps., mileage 209 to 225.42 from Montreal.

15692. Dec. 27.—Ordering C.P.R. to install improved type of electric bell at crossing of County Road, 1 1/4 miles east of Ivanhoe station, Ont., 20% to be paid from railway grade crossing fund.

15693. Dec. 27.—Authorizing C.N.R. to build spur to Ritchie Coal Co.'s yards, Edmonton, Alta.

15694. Dec. 27.—Authorizing C.P.R. and G.T.P. Branch Lines Co. to operate trains over crossing in n.w. 1/4 sec. 32, tp. 17, r. 19, w. 2 m., Sask., pending installation of interlocker required by order 13663, May 16.

15695. Dec. 28.—Recommending to Governor-in-Council for sanction, lease between C.P.R. and Dominion Atlantic Ry.

15696. Dec. 27.—Authorizing C.P.R. to open for traffic portion of its Weyburn-

Lethbridge line from Ogema to Viceroy, mileage 52.2 to 75.85.

15697. Dec. 28.—Authorizing Esquimalt and Nanaimo Ry. to use bridges at mileage 14.0, 54.4, 131.7 and 132.3.

15698. Dec. 26.—Relieving C.P.R. from further protection of crossing at mileage 45.1 from Place Viger station, Montreal.

15699. Dec. 29.—Approving revised location of C.P.R. Swift Current-Brooks branch, mileage 0 to 35.32, Sask.

15700. Dec. 28.—Authorizing C.P.R. to build its Wilkie Northwesterly branch across highway at mileage 7.64, Sask.

15701, 15702. Dec. 29.—Authorizing C.N.O.R. to cross three highways in Trafalgar and Nelson tps.

15703. Dec. 27.—Authorizing C.N.R. to build spur north of 17th St., Saskatoon, Sask.

15704. Dec. 28.—Authorizing G.T.R. to operate trains, without stopping, through Alford Jct., Ont.

15705. Dec. 28.—Authorizing G.T.R. to build spur for National Brick Co., St. Constant, Que.

15706. Dec. 28.—Approving certain alterations in G.T.P.R. revised location in North Alberta District.

15707. Dec. 28.—Authorizing C.N.O.R. to cross seven highways in Nelson and Trafalgar tps.

15708. Dec. 28.—Approving location of C.P.R. Wilkie-Anglia branch, mileage 24.90 to 40.66, and to cross and divert 14 highways, mileage 25.55 to 40.66, Sask.

15709. Dec. 29.—Authorizing C.P.R. to build two spurs for Imperial Oil Co., near Alexander Ave., Winnipeg.

15710. Dec. 29.—Authorizing C.N.O.R. to cross three highways in Nelson tp.

15711. Dec. 30.—Authorizing C.P.R. to rebuild bridge 15.3 over Isaac Creek, Arrow Lake subdivision, B.C., and rescinding order 15681, Dec. 26, which authorized rebuilding of bridge 127.2, Mountain subdivision, B.C.

15712. Dec. 29.—Authorizing C.P.R. to cross with its Estevan-Forward branch 39 highways in Saskatchewan.

15713, 15714. Dec. 30.—Approving C.N.O.R. revised location near Nipigon, mileage 497.16 to 498 from Sudbury Jct., and to cross eight highways in Toronto tp.

15715. Dec. 19.—Authorizing G.T.R. to take certain lands in Kingston, Ont., for enlarged facilities.

15716. Dec. 27.—Suspending G.T.P.R. local and joint passenger tariff C.R.C. 129, relating to baggage of excess size, until all parties can be heard.

15717. Dec. 19.—Approving C.P.R. grade revision between St. Martins Jct. and Ste. Therese, and authorizing it to build double track across six highways.

15718. Dec. 15.—Amending order 7112, May 18, 1909, which authorized M.C.R. to cross with two additional tracks, Sandwich St., Windsor, Ont., and approving temporary bridge, by substituting another plan and providing that new bridge be built during 1912.

15719. Jan. 2.—Appointing W. M. Tisdale, attorney at law, Redlands, Cal., and J. P. Hartman, attorney at law, Seattle, Wash., as commissioners for examination of witnesses in rate case of Dawson Board of Trade vs. White Pass and Yukon Route.

15720. Nov. 27.—Dismissing application of J. Hoolahan, Ste. Agathe des Monts, Que., re C.P.R. rates on perishable goods.

15721. Dec. 30.—Authorizing G.T.P.R. to build transfer track to connect with C.N.R. at Portage la Prairie, Man.

15722. Jan. 2.—Authorizing Midland Ry. of Manitoba (C.N.R.) to operate C.N.R. and G.T.P.R. crossings in St. Boniface parish, Man., for construction purposes only until Mar. 10.

15723. Dec. 30.—Authorizing C.N.O.R. to build bridge over Rideau canal and river at Smiths Falls.

15724. Nov. 21.—Disallowing tariffs of G.T.R., C.P.R., C.N.O.R., C.N.Q.R., Quebec, Montreal and Southern Ry., Central Vermont Ry., Ottawa and New York Ry., Central Ontario Ry., Thousand Islands Ry., Lotbiniere and Megantic Ry., N.Y.C. and H.R. Rd. and Rutland Rd., increasing rates on hay and straw from Ontario and Quebec to eastern U.S. points.

15725. Dec. 16.—Ordering C.P.R. before May 1, 1912, to give S. Plunkett, Vaughan tp., Ont., as good grade over new crossing as over old one before track elevation.

15726. Jan. 3.—Extending to Feb. 15 time for filing tariffs by G.N.R. on fertilizer from Vancouver and New Westminster, for W. H. Haight, Pipers Siding, B.C.

15727. Dec. 19.—Ordering G.T.P.R. to build station on lot 882, and restraining it from locating station on lot 851, group 1, Cassiar district, B.C.

15728. Jan. 3.—Authorizing C.N.O.R. to cross public road between southeast and southwest parts of lot 15, con. 1, Toronto tp.

15729. Jan. 2.—Authorizing C.P.R. to build

spur for Shawinigan Water and Power Co., Notre Dame du Mont Carmel parish, Que.

15730. Jan. 2.—Dismissing G.T.P.R. application for approval of location of its Prince Rupert Western line, mileage 0.00 to 3.23, r. 5, Coast District, B.C.

15731, 15732. Jan. 3.—Ordering C.P.R. before May 1 to provide suitable farm crossing for J. Connelly, Macleod, Alta., and before June 1, to build cattle pass for J. Smith, Wolfston, Sask.

15733. Jan. 4.—Authorizing C.P.R. to operate siding to Union stock yards, Toronto.

15734. Jan. 3.—Amending order 15580, Dec. 11, 1911, by providing that cost of protection of crossing by T.H. and B. Ry. over G.T.R. and Hamilton Radial Ry., Hamilton, Ont., be paid one-third by G.T.R. and balance by T.H. and B.R.

15735. Jan. 2.—Ordering G.T.P.R. to remove sufficient rock fill at Cameron Bay, Prince Rupert, B.C., and to file with Board before Feb. 15, plan showing location of opening and depth of girders for carrying track, etc., re obstruction caused to navigation.

15736, 15737. Jan. 5.—Approving location of C.N.O.R. Montreal-Port Arthur line through Widdfield, Cammanda, Beacage, and Pedley tps., Nipissing District, mileage 346.37 to 366 from Montreal, and through Capreol tp., mileage 0 to 71.81 from Capreol Jct.

15738. Jan. 4.—Authorizing C.P.R. to build two spurs for Port Arthur Wagon Co., Port Arthur, Ont.

15739. Jan. 3.—Authorizing C.N.O.R. to build branch from Oshawa station to Oshawa, mileage 0 to 3.95, to connect with Toronto Eastern Ry.

15740 to 15742. Jan. 4, 3, 2.—Authorizing C.P.R. to build spurs for Strome Milling and Grain Co., Strome, Alta.; Swift Canadian Co., Winnipeg, Man., and E. Julian and Co., Quebec, Que.

15743. Jan. 4.—Authorizing C.P.R. to rebuild bridge 63.8, Brandon subdivision, Man.

15744. Jan. 3.—Relieving C.P.R. from further protection at crossing in Campbellville, Ont.

15745. Jan. 3.—Authorizing T.H. and B.R. to build spur for Armstrong Supply Co., Hamilton, Ont.

15746. Jan. 3.—Authorizing G.T.R. to build spur for Schell Bros. and Blow, North Cayuga tp., Ont.

15747. Jan. 3.—Relieving G.T.R. from further protection at crossing 1½ miles east of Glencoe, Ont.

15748. Jan. 4.—Authorizing C.N.O.R. to cross public road in Nelson tp.

15749. Jan. 3.—Authorizing city of Winnipeg to extend Ellice Ave. across C.P.R. Pembina branch.

15750. Jan. 3.—Approving location of South Ontario Pacific Ry. station at Progression, mileage 5.32, East Flamboro tp.

15751. Dec. 14.—Ordering G.T.R. to employ watchman from May 1 to Oct. 1, each year at crossing just east of Grimsby Beach, Ont., 15% to be paid by Grimsby tp.

15752. Jan. 3.—Extending to June 1 time for G.T.R. to make changes to water standpipes at Alexandria, Ont.

15753. Jan. 11.—Approving G.N.R. plans for spur for W. H. Haight, Piper's Siding, B.C.

15754. Jan. 8.—General order re freight rates to Western Canada; this order is given in full on another page.

15755. Jan. 8.—Authorizing C.P.R. to build spur for Bardsley and Peterson in n.e. ¼ sec. 4, tp. 2, r. 7, w. 2 m.

15756. Jan. 8.—Authorizing G.T.R. to build spur for Lautz Co., Bridgeburg, Ont.

15757. Dec. 28.—Ordering Atlantic, Quebec and Western Ry. to provide joint farm crossing for A. Lelievre, Little River East, with that ordered by order 15456, Nov. 22, 1911, for A. Shannon.

15758. Jan. 8.—Authorizing C.N.O.R. to build from Central Ontario Ry. at Stanley St., Trenton, to a railway bridge across Trent River.

15759. Jan. 8.—Authorizing express collection and delivery limits for Strathcona, Alta.

15760. Jan. 4.—Authorizing C.P.R. to divert road allowance in Mara tp., Ont., mileage 41.56 from Port McNicoll.

15761, 15762. Jan. 4.—Authorizing C.N.O.R. to take lands, etc., of G. W. Burgess and J. Penny, in Belleville, Ont.

15763. Jan. 8.—Authorizing G.T.P. Branch Lines Co. to cross with its Melville-Regina line, public road at mile post 42, Lebrex, Sask.

15764. Jan. 9.—Ordering that G.T.R. crossing over Yonge St., Simcoe, Ont., when watchman is not on duty, be protected by flagman for all switching movements.

15765. Jan. 5.—Ordering C.N.R. to erect by Feb. 15, under penalty of \$10 a day, wind breaks, etc., just east of Melfort, Sask.

15766. Dec. 13.—Approving plans and location for G.T.R. new station at Stoney Point, Ont.

15767. Jan. 3.—Authorizing C.P.R. to cross with its Swift Current-Brooks branch, 23 highways in Saskatchewan.

15768. Jan. 11.—Authorizing C.P.R. to build sidings into Union Stock Yards, Toronto.

15769. Jan. 9.—Authorizing C.N.O.R. to open for traffic its line from Harrowsmith to Sydenham, mileage 160.50 to 163.50 from Don Jct.

15770. Jan. 11.—Authorizing Saskatchewan Government to divert highway and cross C.P.R. at Foam Lake, Sask.

15771. Jan. 9.—Authorizing G.T.P. Branch Lines Co. to cross with its Melville-Regina branch, and divert highways at mileage 85.9 to 58.9, Sask.

15772. Jan. 9.—Authorizing T.H. and B.R. to discontinue operation of its interlocking appliances at Hamilton St. Ry. crossing, Barton St. East, Hamilton, until May 1, crossing to be protected by flag during passage of trains.

15773. Jan. 11.—Authorizing C.P.R. to operate spur for Lowe Bros., Sorauren Ave., Toronto.

15774, 15775. Jan. 10.—Extending to Mar. 31 and May 31, respectively, time for completion by C.P.R. of subways at sec. 34, tp. 24, r. 2, w. 5 m., and at Jane St., West Toronto.

15776. Jan. 12.—Approving Lachine, Jacques Cartier and Maisonneuve Ry. location, 400 ft. west of C.P.R. crossing at Ibeville St., to terminal at St. Catherine St., Montreal, through C.P.R. lands, subject to agreement between the two companies.

15777. Jan. 8.—Ordering C.P.R. before June 15, to provide interchange track with G.T.R. in Goderich, Ont.

15778. Jan. 9.—Authorizing express collection and delivery limits for Brighton, Ont.

15779. Jan. 10.—Ordering Canadian Ex. Co. to file tariff before Jan. 20, abolishing extra charge between Picton, N.S., and Charlottetown, P.E.I., except when it be necessary, owing to weather conditions, for traffic to be carried to Georgetown, P.E.I.

15780. Jan. 4.—Directing C.P.R. not later than Feb. 10 to provide two passenger trains a day each way between Ottawa and Prescott, Ont.

15781. Jan. 8.—Authorizing C.N.R. to cross overhead with its Vegreville-Calgary branch, the C.P.R. Macleod branch in s.w. ¼ sec. 11, tp. 24, r. 1, w. 5 m., Alta.

15782. Jan. 9.—Authorizing N.Y.C. and H.R. Rd. to rebuild interlocking plant at G.T.R. crossing, Cecile Jct., Que.

15783, 15784. Jan. 8.—Correcting omissions and errors in G.T.P. Branch Lines Co.'s Regina-Boundary branch location.

15785. Jan. 10.—Authorizing C.P.R. to build its Wilkie-Anglia branch across 12 highways, mileage 0 to 19.37, Sask.

15786. Jan. 10.—Authorizing G.T.R. to build siding for International Varnish Co., and Finchin, Johnson and Co., Toronto.

15787. Jan. 10.—Authorizing T.H. and B.R. to build five spurs for Verity Plow Co., Brantford, Ont.

15788. Jan. 12.—Authorizing C.N.R. to open for traffic its line from Grosse Isle, Man., to end of track, 31 miles, fencing, etc., to be completed by Aug. 1.

15789. Jan. 12.—Authorizing G.T.R. to rebuild bridge 39 at mileage 216.51, over Pike's Creek, District 18, Ont.

15790. Jan. 4.—Authorizing C.N.O.R. to take property of J. Britnell, Belleville, for diverting Bay St.

15791. Jan. 10.—Authorizing C.P.R. to rebuild bridge 43.8, Farnham subdivision, Montreal terminals.

15792. Jan. 13.—Authorizing British Columbia Government to build highway crossing over Columbia and Western Ry. at Eholt.

15793. Jan. 13.—Authorizing C.P.R. to build spur for Standard Fish and Fertilizer Co., Calgary, Alta.

15794. Jan. 11.—Authorizing C.P.R. to build its Kerrobert Northeasterly branch across highways from mileage 1.52 to 19.16, Sask.

15795. Jan. 12.—Authorizing C.N.R. to use for construction purposes only, until July 1, its Deslisle extension crossing of C.P.R. Moose Jaw-Lacombe branch.

15796. Jan. 11.—Authorizing C.N.R. to build spur for Saskatoon Milling and Elevating Co., Saskatoon, Sask.

15797 to 15799. Jan. 15.—Approving C.N.O.R. Montreal-Port Arthur line location through unsurveyed territory, Algoma District, mileage 327 to 343.15, and from Sudbury Jct. and Montreal-Port Arthur line location through Nepean, March and Tarbolton tps., mileage 14.3 to 27, and through Ross, Westmeath and Pembroke tps., mileage 67 to 83.45 from Ottawa.

15800. Jan. 12.—Authorizing city of Toronto to maintain wires across C.P.R. and G.T.R. and G.N.W. Telegraph Co. and C.P.R. telegraph wires at Queen St., Toronto, and rescinding order 13817, May 31, 1911.

15801. Jan. 11.—Authorizing C.P.R. to build public crossing at mileage 70.06, Cartier subdivision, Ont.

15802. Jan. 11.—Authorizing Canadian Copper Co. to build spur across Algoma Eastern Ry. at grade, and C.P.R. overhead, interlocking semaphores to be installed.

15803. Jan. 15.—Relieving C.P.R. from erecting fences and cattle guards between Woodstock and Andover, N.B.

15804, 15805. Jan. 15, 16.—Correcting errors in location of G.T.P. Branch Lines Co.'s Biggar-Calgary and Regina-Moose Jaw branches.

15806. Dec. 21.—Ordering G.T.R. to install improved electric bell at Edward St., Prescott, Ont., 20% to be paid from railway grade crossing fund.

15807. Nov. 27.—Authorizing C.N.O.R. to connect with Montreal Terminal Ry. and C.N.Q.R. near Montreal.

15808. Jan. 17.—Amending order 15655, Dec. 20, 1911, which authorized city of Port William, Ont., to widen Victoria Ave. across C.N.R. at Vickers St., by striking out, at Vickers St.

15809. Jan. 17.—Authorizing C.N.R. to build spur at Neepawa, Man.

15810. Jan. 4.—Dismissing application of Sanitaris, Ltd., Arnprior, Ont., re express classification on returned empties.

15811. Jan. 9.—Authorizing C.P.R. to take certain lands in Toronto, and build branch across G.T.R. and join tracks used jointly with G.T.R., also to cross Toronto Ry. at junction of Spadina Ave. and Front St., Toronto.

15812. Jan. 18.—Authorizing C.P.R. to build spur for Stone Fertilizer Co., North Oxford tp., Ont.

15813, 15814. Jan. 16, 18.—Approving plans of Gilbert drain along M.C.R. right of way, to be built by Southwold tp., Ont.; also plans and character of Chauvin drain, under G.T.R. in Tilbury North tp., Ont.

Canadian Ticket Agents' Association.

At a meeting of the executive committee in Toronto Jan. 18 it was decided to hold the next annual meeting at Ottawa, Oct. 8 and 9, with headquarters at the Chateau Laurier, and a trip will be made to Montreal.

J. A. McKenzie, outside ticket agent, G.T.R., Woodstock, Ont., and an ex-President of the Association, was appointed to represent the Association at the American Association of General Passenger and Ticket Agents annual meeting at Seattle, Wash., next autumn.

An invitation to send a representative to the American Association of Passenger Agents annual meeting was referred to a special committee to be dealt with when the place and date of meeting are announced.

J. F. Dolan, city ticket agent, R. and O.N. Co., Montreal, and ex-President of the Association, was elected a member of the executive committee, vice M. McNamara, deceased.

A resolution of sympathy in connection with the death of Mr. McNamara, ex-President, was adopted.

The Association's honorary counsel, J. H. Flock, K.C., of London, having given an opinion that the amendments to the constitution, including a change of the Association's name, which were adopted at the annual meeting at Sault Ste. Marie in Oct., 1911, were ultra vires, it was decided not to act upon them.

C. E. McPherson, Assistant Passenger Traffic Manager, Western Lines, C.P.R., Winnipeg, dropped in during the meeting and was warmly welcomed.

What is said to be the longest and heaviest train ever operated, reported by Machinery, was recently run from Altoona to Enola, Pa., 127 miles. Its length was 4,888 ft.—nearly a mile—and it consisted of 120 steel gondola cars loaded with 6,450 tons of coal. It was pulled at the rate of 13 miles an hour by a single locomotive of the Pennsylvania H-6-B type. The locomotive was in communication with the caboose by telephone. The train was run as a test to determine the capacity of freight locomotives over the improved sections of the line where grades have been removed and curves compensated.

Railway Rolling Stock Notes.

The G.T.R. has ordered 250 refrigerator cars, 30 tons capacity, from the Canadian Car and Foundry Co., Montreal.

Mussens, Ltd., have ordered four steel underframe flat cars, 40 tons capacity, from the Canadian Car and Foundry Co., Montreal.

Cavicchi and Pegano, railway contractors, have ordered 16 dump cars, 30 tons capacity, from the Canadian Car and Foundry Co., Montreal.

The Dominion Equipment and Supply Co., Winnipeg, has ordered three Lidgerwood flat cars from the Canadian Car and Foundry Co., Montreal.

The Grand Trunk Pacific Ry. has ordered two complete sets of top ploughs from F. H. Hopkins and Co., Montreal, and two spreaders from the United States.

The Grand Trunk Pacific Ry. has received eight Pacific type locomotives, nos. 1101 to 1108, and four switching locomotives, nos. 402 to 405, from the Montreal Locomotive Works.

The Central Vermont Ry. is reported to have ordered four Pacific type locomotives from the Baldwin Locomotive Works, and three switching locomotives from the Lima Locomotive and Machine Co.

The G.T.P.R. has ordered 300 forty ton steel underframe Hart-convertible ballast and construction cars, for delivery in the spring, and three Rodger double plough distributing cars, from the Hart-Otis Car Co., Montreal.

The Charlottetown, P.E.I., Board of Trade passed a resolution, Jan. 10, urging the Dominion Government to build in the local shops, locomotives and other rolling stock required for the proposed re-construction of the P.E.I. Ry. to standard gauge.

The Grand Trunk Pacific Ry. has ordered 25 consolidation locomotives, with Schmidt superheaters, from the Montreal Locomotive Works, and 15 consolidation locomotives, with Schmidt superheaters, in addition to the 25, details of which we gave in our last issue, from the Canadian Locomotive Co.

The Canadian Northern Ry. between Dec. 15, 1911, and Jan. 15, received the following additions to rolling stock:—one first class car, five snow ploughs and 70 box cars, from the Canadian Car and Foundry Co.; 90 box cars from the Crossen Car Co.; one consolidation locomotive from the Canada Foundry Co., and 80 box cars from the Nova Scotia Car Works.

The Intercolonial Ry., since Dec. 19, 1911, has received the following additions to rolling stock:—18 box cars, 60,000 lbs. capacity, 85 steel frame box cars, 60,000 lbs. capacity, and 46 Hart-Otis steel dump cars, 100,000 lbs. capacity, from the Canadian Car and Foundry Co.; four switching and five Pacific type locomotives, from the Canadian Locomotive Co., and four box cars, 60,000 lbs. capacity.

The C.P.R., between Dec. 14, 1911, and Jan. 18, received the following additions to rolling stock:—two flangers, two snow ploughs, four vans, 10 baggage and express cars, one dining car, two G1, two G2 and four D4 locomotives from its Angus shops, Montreal; eight D4 locomotives from the Montreal Locomotive Works; 50 ballast cars from the Canadian Car and Foundry Co., Montreal, and one wrecking crane from the U.S.

The C.P.R., between Dec. 14, 1911, and Jan. 18, ordered the following rolling stock:—one flanger, 66 wooden box cars, five vans, two superintendents' business cars, 308 stock cars, 201 freight

refrigerator cars, 10 P1 locomotives and 10 U3 switching locomotives, from its Angus shops, Montreal; 50 D10 locomotives from the Montreal Locomotive Works; 400 flat cars from the Canadian Car and Foundry Co., and 200 stone cars from the Nova Scotia Car Works.

The Mond Nickel Co. has ordered 12 Otis type, all steel short cars, 50 tons capacity, for its ore service, from the Hart-Otis Car Co., Montreal. Following are the chief dimensions:—

Length over end sills	21 ft. 9½ ins.
Length inside	19 ft. 1 in.
Width over all	9 ft. 11¼ ins.
Width inside	9 ft. 6 ins.
Height inside	4 ft. 6 ins.
Height from rail to top	8 ft. 10¾ ins.
Height from rail to floor	4 ft. 4¾ ins.
Truck centres	11 ft. 11 ins.
Wheel base of truck	5 ft. 4 ins.
Doors on each side	Four
Width of door opening	2 ft. 2 ins.
Length of door opening	19 ft. 1 in.

The G.T.R., for the three months ended Dec. 31, 1911, ordered the following rolling stock:—2,000 box cars from the Canadian Car and Foundry Co., and 44 passenger cars, 23 baggage cars, 1,000 box cars and 1,000 coal cars in the United States; and received the following additions to rolling stock:—six passenger cars and five baggage cars from its Point St. Charles shops, Montreal; one snow plough from its London, Ont., shops; 926 box cars from the Canadian Car and Foundry Co., and 10 freight locomotives from the American Locomotive Co. Details of these have been given in previous issues.

The Canadian Car and Foundry Co., Montreal, between Dec. 15, 1911, and Jan. 15, made the following shipments of rolling stock:—two first class passenger cars, two sleeping cars, five snow ploughs, 118 box cars and five steel underframe flat cars, for the Canadian Northern Ry.; one 40-ton steel frame drop bottom box car and 48 fifty-ton steel frame box cars, for the Canadian Pacific Ry.; 46 fifty-ton Otis dump cars and 108 thirty-ton steel frame box cars for the Intercolonial Ry.; 252 thirty-ton steel frame box cars for the Grand Trunk Ry.; one tourist car for the Grand Trunk Pacific Ry., and two pay-as-you-enter composite passenger cars for the Montreal St. Ry.

Following are chief details of the rotary snow plough which the Canadian Northern Ry. is having built by the Montreal Locomotive Works,—

Cylinders, diar. and stroke	17 by 22 ins.
Truck wheels, diar.	33 ins.
Boiler, diar.	60 ins.
Boiler pressure	190 lbs.
Firebox, length and width	92 by 50 ins.
Tubes, no. and diar.	202 2 ins.
Tubes, length	9 ft. 8 ins.
Heating surface, tubes	1,022 sq. ft.
Heating surface, firebox	130 sq. ft.
Heating surface, total	1,152 sq. ft.
Grate area	31.9 sq. ft.
Drum, width	10 ft.
Cut width	10 ft. 7 ins.
Rotary wheel, diar.	9 ft. 8½ ins.
Length over all	38 ft. 3 ins.
Height, extreme	15 ft.
Weight on forward truck	82,000 lbs.
Weight on rear truck	70,000 lbs.
Weight, total	152,000 lbs.
Tender capacity, water	5,000 imp. gals.
Tender capacity, coal	10 tons

It was reported in Chicago recently that several of the steam railways terminating there were about to install Edison storage battery cars for suburban service. Among those mentioned were the Illinois Central Rd. and the Chicago Great Western Rd. Inquiry at the offices of these companies elicited a statement that the companies had not placed any orders for these cars, but were considering the question carefully, and that the limited clearances for overhead construction and for third rails made the freedom from these factors an important merit of storage battery cars.

Grand Trunk Railway Construction, Betterments, Etc.

New England Plans.—Application was made to the General Court of Massachusetts, Jan. 13, for authority to build a railway into Worcester and Boston, and to operate steamships within the Commonwealth's jurisdiction. One of the routes by which entrance is desired into Boston is from Blackstone on the Southern New England Ry., which is to be built into Providence, R.I., and a second is from Bellows Falls on the Central Vermont Ry., while entrance is sought into Worcester by a branch from Douglas on the Southern New England Ry. The application is made by the Southern New England Ry., a subsidiary of the Central Vermont Ry., which is controlled by the G.T.R.

The board of aldermen of Providence, R.I., passed an ordinance, Dec. 29, authorizing the laying of track to the water front of that city by the Southern New England Ry.

Central Vermont Ry.—The Board of Railway Commissioners has ordered the company to ballast its entire line between St. Lambert and Waterloo, Que.; Marieville and St. Cesaire, Que.; Farnham and Friesburg, Que.; Iberville and Farnham, Que.; and to repair all bridges, farm crossings, highway crossings, and fencing; the ballast to be six inches lift, the entire work to be completed by Oct. 1.

Kingston, Ont.—Application has been made to the Kingston, Ont., city council for the supply of 1,000 h.p. to operate drills and crushing machinery at a granite quarry in the vicinity of the city. The granite, it is stated, is to be used for the ballasting of the main line, in place of gravel. The matter was considered by the city council Jan. 8, and steps are being taken to provide the power, which is wanted in April.

Orillia, Ont.—A press report states that a site has been purchased in Orillia, Ont., on which to erect an office building. It is further stated that a new station will be built opposite the C.P.R. station on Mississauga St., and that a loop line is to be built to connect Orillia with Washago, round the west side of Lake Couchiching.

Canada Atlantic Ry.—The company is arranging, according to press reports, to carry out an extensive programme of improvements on the C.A. Ry. through the Algonquin Park. The Highland Inn, it is stated, will have a 40 room addition built to it in time for next summer's tourist traffic. (Jan., pg. 20.)

Kingston and Pembroke Ry. Management.—A Kingston, Ont., dispatch of Jan. 24 says:—"Sir Thos. Shaughnessy has made the announcement that the C.P.R. intends shortly to take over the Kingston and Pembroke Ry., and make extensive improvements."

The C.P.R. is reported to be arranging to lay out and operate an experimental farm in New Brunswick.

The Dominion Government has refused to advise the disallowance of the Alberta Legislature's act cancelling Alberta and Great Waterways Ry. Co.'s franchise and the contract between the Alberta Government and the company for its construction.

The C.P.R. will run a farm special over its eastern lines during the summer, starting in Ontario in March, passing through Quebec, and completing the service in New Brunswick. The train will consist of three exhibit cars for agricultural products, three lecture cars and a staff of lecturers provided by the various provincial agricultural departments. The whole will be in charge of H. P. Timmerman, Industrial Commissioner, C.P.R.

Electric Railway Department

British Columbia Electric Railway Company's Locomotives

The B.C. Electric Ry. Co. has recently added two more electric locomotives to its rolling stock.

They were designed for operation on 600 volts direct current. They are of the double-truck, central-cab type and are required to haul cars around curves of 75 ft. radius and to traverse curves of 34 ft. radius when running alone. The trucks have equalized pedestals, square frames forged in one piece, half-elliptic springs and cast-steel rigid bolsters. The bolsters are cast in one piece with the brake lever fulcrums and side bearings, and are provided with suitable lugs on which part of the weight of the motors is distributed.

The frame is composed of four 12-in. channel longitudinal sills with cast-iron bumpers. Diagonal braces, $1\frac{1}{4}$ by 9 in., reinforce the frame between the middle and outside sills. The frame bolsters are made of $1\frac{3}{4}$ by 15 in. plates, and the transverse cover plates are $\frac{7}{8}$ by 15 in. The bumpers have lugs to which the longitudinal sills are riveted and are cast in one piece with the coupler pockets and poling sockets. The cab is built of steel plate and can be entered from either end. Brakes are provided on all wheels, and are both hand and pneumatically operated. The equipment includes sand-boxes, pilots and automatic couplers at each end; also a bell and whistle. The couplers are so arranged that, if desired, extension drawbars may be used.

The principal dimensions are as follows:—

Wheelbase, rigid	6 ft. 8 in.
Wheelbase, total	22 ft. 2 in.
Distance between truck centres	15 ft. 6 in.
Distance between coupler knuckles	31 ft. 1 in.
Driving wheels, diameter, outside	36 in.
Driving wheels, diameter, centres	30 in.
Journals	5 ft. 6 in.
Width	9 ft. 6 in.
Height	12 ft.
Weight	90,000 lb.

Each locomotive carries four motors, one motor geared to each axle with a ratio of 17:60. The weight of the motors is carried by the two axle bearings and by a nose which rests directly on the truck transom. To facilitate repairs the wheels, axles and motors can be dropped into an overhauling pit, or one end of the cab can be jacked up, and a truck run out.

The motors are of the no. 307-D interpole type. The box type frame is of steel cast in one piece and is so constructed that the armature and bearing housings can be easily removed. The brush holders are also readily accessible. The field frame contains four interpole coils and four main field coils wound with flat copper strap, which is insulated with asbestos tape and impregnated with an insulating, heat-conducting and waterproof compound. This insulation will not be injured if a temperature of 100 deg. C. is sometimes reached in service. The motors operate efficiently on potentials ranging from 300 to 600 volts. The normal rating of the motor is 150 h.p. at 500 volts and 260 amp. with blowers. The approximate continuous rating, with blowers, is 175 amp. at 300 volts. The weight of each motor, including gears, gear cases, pinions and axle bearings, is 5,510 lbs.

The current for the H.B. (hand-operated) unit switch control is obtained from a low-voltage storage battery, eliminating all heavy current-carrying parts in the controller. This control apparatus is small, light and extremely simple. Powerful forces are used to operate the switches and reverser, thereby providing great momentary

overload capacity. An exceptionally powerful magnetic blowout is employed to insure long life to the contact tips and other wearing parts. The use of an independent control circuit enables the motorman to throw the reverser in case of emergencies or in case the power should go off the line.

The simple operation of the type H.B.

End View of Electric Locomotive.

control makes it very easy for the locomotive motorman to lean from the cab window and watch for signals while manipulating his controller. Many of the heavier K or L types of controller require practically all of a motorman's strength to operate. Another advantage of type H.B. control over the K. and L. types is that it is impossible for the

following apparatus:—Two no. 264 line switches, two no. 264 switch groups, two no. 1764 reversers, two no. 133 master controllers, one no. 351 control cut-out switches, two no. 430 junction boxes, four no. 448 train line receptacles, two no. 449 train line jumpers, one set grid resistances, one set pneumatic details.

The motors are connected in series and in parallel in conjunction with the necessary resistance. This provides three running positions, namely: four motors in series, two motors in series, two motors in parallel, and four motors in parallel. There are seven resistance steps with the motors connected in series, six with the motors in series parallel and five with all motors in parallel. Reversing is accomplished by means of two pneumatically-operated reversers, each reverser operating two motors. The control combinations are effected by two pneumatically-operated unit switch control groups. A master controller of the locomotive type is located in each end of the cab.

The brake equipment is the Westinghouse E.L. type, which provides for automatic operation of the locomotive and train brakes. Air for the brakes control system is furnished by a no. C-60 motor-driven compressor, which has a delivery capacity of approximately 50 cu. ft. of free air per minute. Each locomotive has a motor-driven centrifugal blower set which furnishes forced ventilation to the motors.

The motors and auxiliary apparatus have sufficient capacity to enable the locomotive to exert continuously a tractive effort of 6,800 lbs. with forced ventilation. Without forced ventilation the continuous tractive effort is 3,500 lbs. The locomotive is also able to exert a maximum tractive effort of 12,800 lbs. at approximately 17.5 m.p.h. for one hour. With clean dry rails the maximum tractive effort is 20,000 lbs. at 500 volts, at all speeds up to 15 m.p.h. With sand a momentary tractive effort of 26,000 lbs. can be exerted.

The hauling capacity of the locomotive is as follows:—

British Columbia Electric Railway Locomotive.

motorman to stop between notches and draw an arc. He must advance his control handle a whole notch with every forward movement. Another important feature of the type H.B. control is its ability to control locomotives in multiple or "double-heading" when handling heavy traffic.

The control equipment consists of the

Number of Cars Each Weighing 45 Tons with Load at 17.5 m.p.h. at 550 Volts.			
Straight.		*Maximum Grade.	
Level road	$\frac{1}{2}\%$	1%	2%
39 cars	15 cars	9 cars	5 cars

*On fairly level and straight road the load to be handled is determined by the maximum grade.

The figures given for "straight, level

track" show the load which may be handled in switching service. The foregoing values given under maximum grade are safe when the grade requires a pull of but five minutes or ten minutes duration. In any particular case the number of cars that can be handled may be greater or less than the values above tabulated, depending upon the profile, curves and operating conditions.

The Baldwin Locomotive Works, Philadelphia, Pa., built the cab, trucks and all mechanical parts, the Westinghouse Electric and Manufacturing Co. built and installed the electrical equipment, including motors and control.

The Canadian Street Railway Association

By James Anderson, President.

At the dawn of a new year, it might not be amiss for me to give a short retrospect of the past few months from an electric railway point of view.

The past year has been an unusually busy one for the company with which I am identified (the Sandwich, Windsor and Amherstburg Ry.) and also for a great many of the other companies composing the Canadian Street Railway Association. This association was organized about eight years ago and has nearly every system in the Dominion, with the exception of municipally owned lines, represented on its membership roll. About 90% of the mileage in Canada is included in the association, the annual meetings of which are held during the

The classification of accounts used by most of the systems in Canada is that of the American Association.

Our policy is to assist in solving the problems of the different companies and to give them the best advice that we can from the association of practical men in the different departments. Some of us do not have the same opportunities as others of going around and seeing what is done in communities larger than our own. If we did perhaps we should, like myself, sometimes feel ashamed of our home conditions. The public is not always to blame for its severe criticism of us; in fact, I am inclined to think we are often let down too easily.

In conclusion, let me say to the members of the Canadian electric railway fraternity that, although we have not as yet decided where we shall hold our next annual meeting, I trust that wherever it may be you will attend with all the representatives that your company can afford or spare from the service.

Edmonton Radial Railway.

The city of Edmonton, Alta., which owns and operates the Edmonton Radial Ry., is adding 15 double truck, double end, pay-as-you-enter cars to its equipment. Following are the principal particulars:—

Length of car body	30 ft. 6 ins.
Length overall, approximately	45 ft.
Width overall	8 ft. 10 ins.
Width over side sheathing, approximately	8 ft. 6 ins.

carried numbered 381,922 and the receipts were \$15,982.34. The Edmonton Capital says:—"Figuring the cost of carrying each passenger at the cost for Nov., the system will show a deficit for Dec. of \$4,625.37. In Nov. the deficit was \$3,672.40. However, the proportion of cost per passenger will be less, providing power charges are the same as the month previous, for the reason that the operation expenses will be no greater, overhead will remain fixed, likewise capital charges. Consequently, the average loss per passenger might reasonably be expected to be less than 7 mills, the loss for Nov. It has been a fact that in the past the more passengers are carried the greater the loss has been. In short, the traffic has constantly been becoming heavier and the deficit greater."

Jurisdiction Over Montreal Street Railway

The city of Montreal has lost its appeal to the British Privy Council against the Montreal St. Ry. The case involved the question of whether the Board of Railway Commissioners had jurisdiction over provincial railway companies or companies operating under provincial charter connected with lines operating under Dominion charter. About a year ago the Board of Railway Commissioners, on the complaint of certain residents of Mount Royal ward, Montreal, ordered that the Montreal St. Ry. reduce fares on its Mount Royal ward service, so as to

British Columbia Electric Railway Locomotives. Side and End Elevations.

early part of June. There are about 20 member companies. They are separated by the width of the Dominion, and include Halifax and St. John on the east and Vancouver on the west. Yet at the meeting in Windsor, Ont., last June, all parts of the Dominion were represented and those present took a keen interest in the discussion of the papers and practical talks that were given on that occasion. There is no doubt of the good service which the association is doing among its members, or of the valuable information that the small corporations can get from the experts in the different departments of the larger companies by meeting together. In fact, the opportunity of hearing and discussing the papers presented at our meetings is one which should not be missed by any Canadian electric railway official.

It has been my pleasure and privilege to attend several meetings of the Central Electric Railway Association and I believe that this association has done more to bring about uniformity and standardization of electric railways in Ohio, Indiana and adjoining States than any other influence that exists. It is by keeping in close touch with the other fellow that we are able to keep in the front rank ourselves.

Our association is working along the same lines, desiring to get uniformity in the operating rules which were approved by our association last July and have been submitted to the Board of Railway Commissioners for approval.

They will have a seating capacity of 36 passengers. The framing will be steel. The steps and doors will be folding and operated together by the one handle. The interior finish will be cherry, and the ceiling three-ply veneer bird's eye maple. The trucks will be 27G1 and they will have rolled steel wheels and Westinghouse air brakes. There will be two longitudinal seats at each end, each 5¼ ft. long and five pairs of reversible cross seats each 3 ft. long. Twill weave rattan will be used for the seats.

The car barn to be built will be of brick and concrete, with a capacity of approximately 100 cars, and will have a repair shops and offices. The extreme length of the entire building is approximately 558 ft., extreme width 225 ft. The main storage will contain 12 tracks each 300 ft. long. In the rear of this will be a transfer table, without pits, working across the full width of the building. Beyond this will come the repair section, 120 ft. long, a part of which will also be used for storage. In the rear and to one side of the repair pits will be located the various shops. The barn will be heated from a central plant by hot air. It is proposed to locate a power sub-station at the barn which will have an ultimate capacity of approximately 1,600 k.w.

In 1911 the number of passengers carried was 660,768 and the revenue \$27,382.74, an average per passenger of 4.13 cents. In Dec., 1910, the passengers

afford people in that district transportation at the same rate as that enjoyed by the residents of Notre Dame de Grace.

The Montreal St. Ry. contended that the Board of Railway Commissioners had no right to give such an order, and claimed that it could only be controlled by the Provincial Government, which granted its charter. The Supreme Court of Canada upheld the Montreal St. Ry.'s contention, Sir Louis Davies and Judge Anglin dissenting. The city of Montreal obtained leave from the Privy Council to appeal from the Supreme Court's judgment, and it is this appeal which has been dismissed.

Levis County Railway Company's Annual Report.

The receipts for the year ended June 30, 1911, were \$66,656.98; expenses, \$57,755.03; net earnings, \$8,901.95. The interest on bonds and loans for the year was \$12,728.48, leaving a profit and loss debit of \$3,826.53, which, added to \$28,386.58 as the debit account, June 30, 1910, leaves a total profit and loss debit balance of \$32,213.11.

Following are the directors and officers elected for the current year:—President, S. H. Ewing; Vice President, Hon. R. Turner; Secretary-Treasurer, E. A. Macnutt; other directors, J. A. Richardson, J. Forman, Col. C. E. Allen-Jones, J. C. Blouin.

C. E. A. Carr's Removal from Quebec.

C. E. A. Carr, who since Jan., 1910, has been General Manager of the Quebec Railway, Light, Heat and Power Co., has resigned on being appointed General Manager of the New Orleans, Southern and Grand Isle Ry. and of the Algiers Ry. and Lighting Co., at New Orleans, La.

On Jan. 8, he was presented by the staff, with a gold watch and fob, and a silver purse for Mrs. Carr, and they both left Quebec on the following day for New Orleans.

Mr. Carr's move is from one extreme climate to another, and it is a peculiar coincidence that Quebec and New Orleans are the oldest cities on the continent.

The New Orleans Southern and Grand Isle Ry. runs from Algiers, La., which is situated on the south side of the Mississippi River, opposite New Orleans, practically paralleling the river down stream to Buras, 59.6 miles. It is contemplated to build a line from Myrtle Grove, about 25 miles south of New Orleans, to Grand Isle on the Gulf of Mexico, where a harbor will be established. It is standard gauge and its equipment consists of eight locomotives, 10 passenger cars and 139 freight and miscellaneous cars. The President is C. D. Warren, Toronto, formerly President of the Lake Superior Corporation, and at one time largely interested in the Metropolitan Ry., now a portion of the Toronto and York Radial Ry. system.

The Algiers Ry. and Power Co. has six miles of electric railway in Algiers and furnishes power for lighting. It is probable that this company will be amalgamated with the New Orleans, Southern and Grand Isle Ry. Co. in the near future.

British Columbia Electric Railway Power Plant Extension.

Contracts have been let for the hydraulic and electrical equipment for the extension of the generating plant on the north arm of Burrard Inlet. The plans represent an expenditure of approximately \$1,000,000. The installation is to be completed this year. The present output at the north arm plant is 43,500 h.p., which includes one unit of 10,500 h.p. which was placed in operation on Jan. 8. There is also a steam auxiliary plant in Vancouver of 12,000 h.p., one unit of 3,000 h.p. at this station having been put into service during the latter part of December.

The plans for the development at the north arm call for an additional installation of 42,000 h.p. This will give the company an available output of 85,500 h.p. from this station, which means the creation of a power station giving three times the amount of power furnished from any other similar plant in Western Canada.

The company has also recently awarded contracts for the development of its steam auxiliary, making the plant available for an output of 20,000 h.p., and this work will be completed early this year. The combined power at the hydro electric and steam plant which the company will have available at the close of 1912 will be 105,500 h.p., or over 1 h.p. for every two persons within the area of greater Vancouver, the city which is the centre of the company's operations on the mainland. As the company's territory on the mainland is, roughly, 20 by 80 miles, provision will be made for 66 h.p. per square mile over the entire district. Plans are now in hand for the development of other power sites which will bring its total output up to 200,000 horse power.

The development of the north arm

plant will be carried on in connection with the construction of the dam at the mouth of Lake Coquitlam, 90 ft. high. This will give a storage capacity in Lake Coquitlam of 9,000 million cubic feet. During December the company completed the enlargement of the hydraulic tunnel connecting Lake Coquitlam and Lake Buntzen, from which latter point the north arm generating plant is fed at a head of 400 ft. This tunnel was originally 9 by 9 ft., but has been increased to 190 sq. ft. on section.

The new equipment at the north arm station, for which contracts have been awarded, will consist of three units, each of 14,000 h.p. The John McDougall Caledonian Iron Works of Montreal will supply the 14,000 h.p. waterwheels, which will be of the Doble type. They will be the largest units of this kind in America. The electrical equipment will consist of three generators, each of 9,000 k.v.a. capacity, and capable of overload to the maximum of the hydraulic equipment. The three new units will be housed in an independent generating station, located on the north arm waterfront, about 2,000 ft. south of the existing generating station. To convey the water from Lake Buntzen to the station a hydraulic tunnel will be driven through solid granite. It will be 2,250 ft. long, with an internal diameter of 15½ ft., and will be concrete lined throughout to lower the friction factor to the lowest possible point.

Electric Railway Track Laid in 1911.

Below is a table showing track laid on electric railways in Canada during 1911. The table is not published as a complete one, owing to the fact that some of the companies have not replied to the circular sent, but it is believed to be approximately correct. The noteworthy feature is the extensive construction of electric lines in Saskatchewan and Alberta, which promises to be even larger this year than in 1911.

	Miles.
BRITISH COLUMBIA ELECTRIC RY.—

Cape Breton Electric Co.'s Earnings.

Following are the figures for the year ended Sept. 30, 1911:—

	Increase.
Gross earnings	\$333,471.47
Operating expenses	172,401.82
Net earnings	\$161,069.65
Interest charges and taxes	60,108.32
Balance	\$100,961.33
Sinking and Imp. funds	13,685.00
Balance	\$87,276.33
*Decrease.	
Construction charges since Jan. 1, 1911	\$41,805.51

Hamilton District Electric Railways.

Hamilton, Ont., press reports concerning electric railways state that negotiations are in progress for the taking over of the Dominion Power and Transmission Co.'s railways and other properties, and for their amalgamation with the extensive electric railway projects which are controlled by Mackenzie, Mann and Co. The report is denied by the Dominion Power and Transmission Co., but is persisted in, and it is further stated that involved in the whole is the provision of an entrance into Hamilton for the Canadian Northern Ontario Ry. line from Toronto to Buffalo. The Mayor of Hamilton stated recently that he had received a request from the C.N.O. Ry. authorities to defer action on the granting of an extension of line for the building of the Hamilton, Waterloo and Guelph Ry., which J. Patterson is projecting. The Toronto Suburban Ry., a Mackenzie, Mann and Co. line, has power to build a line covering practically the same route as the H.W. and G. Ry., and the report says that in order to secure the right of way at Dundurn Park granted the H.W. and G. Ry., the M., M. and Co. interests will acquire that charter also. The whole situation at present seems very much involved, owing to the various denials, as well as to the activities of officials and agents of M., M. and Co. interests in Hamilton and vicinity.

In an interview at Toronto, Jan. 17, on his return from Europe, Sir Wm. Mackenzie said he was in the market for the D.P. and T. Co., provided the price was right, but that he considered the company had a most excellent opinion of its own value.

Calgary Municipal Railway Earnings.

Following is a comparative statement of revenue, operating expenses and other statistics for 1911 and 1910:—

	REVENUE.	
	1911.	1910.
Passenger earnings	\$37,956.15	\$21,499.80
Miscellaneous earnings	472.85	855.66
	\$38,429.00	\$22,355.46
	OPERATING EXPENSES.	
Maintenance of way and structures	\$ 1,031.70	\$ 369.08
Maintenance of equipment and cars	3,775.51	1,114.03
Transportation	17,916.26	9,980.18
General expenses	1,748.77	976.91
	\$24,472.24	\$12,240.20
Balance of revenue over expenses	13,956.76	9,915.26
Contingent account, 5% of gross receipts	1,921.45	1,117.77
Interest and sinking fund	5,263.33	2,715.88
Net profits	6,771.98	6,081.61
	\$38,429.00	\$22,355.46
Revenue per car mile	28.382c.	35.617c.
Operating expenses per car mile	18.074c.	19.819c.
Gross profit per car mile	10.306c.	15.798c.
Cost of power per car mile	5.293c.	6.783c.
Proportion of operating expenses to revenue	63.6%	55.5%

The Toronto Ry., during 1911, paid to the city, as its percentage of earnings, mileage and taxes, \$687,650.44, against \$596,297.35 in 1910. The percentages of earnings paid to the city range from 8 to 20% on a sliding scale. Mileage is paid at the rate of \$800 a single track mile.

Press reports state that the New York State Rys. Co. has increased its stock. This is believed to be a preliminary step in a plan to build a series of trolley lines across New York State. This company is owned by the New York Central Rd. Co. and has acquired a number of interurban lines in the state for the ultimate purpose of connecting these lines, completing a chain parallel to the New York Central.

Regina Municipal Railway.

Following are extracts from the report of H. Doughty, Superintendent, up to Oct. 31, 1911:

The construction of the Regina Municipal Ry. was started, April 20, 1911, partly by day labor and partly by contract, the work then authorized consisting of some 6½ miles of single track. About the beginning of August, contracts were placed for street pavements, and as street railway tracks had to be installed beforehand, it was deemed expedient to undertake the construction of an extra four miles of single track. This work was authorized on Aug. 7 and the whole layout of track decided upon for the year was installed complete and ready for operation by Nov., such consisting in bulk of 10½ miles single track, made up as follows:—21,000 ft. single track, 60 lbs. steel rails, gravel ballasted; 9,780 ft. single track, 80 lbs. steel rails, concreted and partly paved; and 25,500 ft. single track, or 12,750 ft. double track, 80 lbs. steel rails, concreted and paved, or a total of 57,280 single track complete with all track intersections and overhead construction from April 20 to Nov. 7 in 172 working days, making a daily average of 333 ft. single

to the exhibition grounds be constructed and operated thereon. They were ready for operation on July 26. At that time the street railway unit was installed, but only four cars were in the city assembled ready to put into operation. On the evening of July 27, a trial run was made over the tracks as mentioned above, while on the following day, the railway was declared open and ready for operation by the Lieutenant Governor and the Mayor, the service afterwards for the day being given free to the public. During the two weeks of the exhibition, the railway earnings totalled \$5,881.55, the passengers carried numbering 117,431. As the various parts of the system have been completed, they have been put into operation, and cars are now operating over all tracks laid.

The following figures give the results of operation from the commencement to Oct. 31, showing that it will in the immediate future be on a paying basis, fully taking care of operating expenses, besides providing for payment of interest and sinking fund on capital expenditure:—

Gross earnings	\$14,065.78
Operating expenses	9,028.51

Net earnings over operating expenses. \$ 5,037.27
The railway up to the above date has

Regina Municipal Railway. Cars and Car Crews.

track. The cost of the above work is, approximately, as follows:—
60 lbs. single track ballasted, labor and material at \$4.9 per single foot. \$ 52,222.96
80 lbs. double track, concreted and paved, labor and material at \$12.95 per double foot 165,108.26
80 lbs. single track, concreted and paved, labor and material at \$5.40 per single foot 52,836.96
Track intersections, consisting of wyes, crossovers, turnouts, specials, etc., labor and material costing 101,648.24

Making a cost of all tracks installed complete at \$371,816.42
Basing the above figures per foot on the laying of track per mile complete with overhead construction, the same is as follows:—

60 lbs. steel rails, ballasted track, labor	
60 lbs. steel rails, ballasted track, labor and material per mile single track	\$13,049.20
80 lbs. steel rails, concreted and paved track, labor and material per mile single track	28,512.00
80 lbs. steel rails, concreted and paved double track	68,376.00

These prices compare most favorably with tracks of similar kinds laid in other cities.

On account of the Dominion Exhibition being held in Regina in the first and second weeks in August, it was decided that the tracks from the post office

been in operation 81 days, showing a daily net revenue over operating expenses of \$62.19. The total number of passengers carried to that date was 277,428.

The rolling stock consists of four single truck cars, two double truck cars and one snow sweeper, entailing an expenditure of, approximately, \$36,000. An additional six cars are being provided, but cannot be procured until early spring. An up-to-date car barn has been built sufficient for future requirements, capable of handling 25 cars. Machinery and all necessary equipment have been ordered; these, together with car barn tracks, building, etc., will cost about \$40,000.

It is as yet impossible to determine the total amount of the year's expenditure on street railway work, but it will be, approximately, about \$510,000.

T. P. Shonts, President of the Interborough Rapid Transit Co., which operates the elevated and subway lines in the boroughs of Manhattan and Bronx, New York City, has been elected President of the New York Railways Co., successor to the Metropolitan Street Ry. Co., which has been in the hands of a receiver for the past few years.

Electric Railway Finance, Meetings, Etc.

Berlin and Waterloo St. Ry.—The profit for 1911 on this line, which is operated by the town of Berlin, after providing for payment of interest, etc., on debentures, and general maintenance and improvements, was \$4,500.

British Columbia Electric Ry.—Gross earnings for Nov., 1911, \$488,699; working expenses, \$302,489; net operating earnings, \$186,210; renewal funds, \$37,935; net earnings, \$148,275; approximate income from investments, \$25,000; net income, \$173,275; against \$355,292 gross earnings; \$201,891, working expenses; \$153,401, net operating earnings; \$25,417, renewal funds; \$127,984, net earnings; \$20,000 approximate income from investments; \$147,984, net income for Nov., 1910. Aggregate gross earnings for five months ended Nov. 30, 1911, \$2,278,391; net earnings, \$788,417; against \$1,602,414, aggregate gross earnings; \$670,628, net earnings for same period, 1910.

Calgary Municipal Ry.—The annual report of operations for the year 1911 shows:—Passenger earnings, \$361,757.06; miscellaneous earnings, \$7,112, a total of \$368,869.06. Operating expenses, \$191,654.58; net revenue, \$177,214.48. After deducting debenture interest of \$34,110; sinking fund, \$18,159.99; taxes, \$4,528.35, and bank interest, \$5,604.50, there was a surplus of \$114,869.06. This includes \$3,784.70 of material purchased and in stock, and the balance has been appropriated as follows:—Contingent account, \$16,426.50; grant in aid of taxes, \$75,500; cash on hand and receivable, \$19,100.44. The statistics showed:—Passengers carried, 8,838,057; transfer passengers, 864,736; average fare revenue, 4.081; passenger car mileage, 1,126,807; car earnings per car mile, 32.063; operating expenses per car mile, 17.008; cost of power per car mile, 5.180; proportion of operating expenses to revenue, 51.95%.

Edmonton Radial Ry.—Revenue for 1911, \$239,258.61, an increase of 65.8% over that for 1910. The number of passengers carried was 5,748,157, an increase of 67.7%. There were increases in the cost of power, capital charges and track maintenance, amounting to \$29,313.68, this being greater than the total deficit in 1910. The deficit for 1911 was \$34,826.07.

Halifax Electric Tramway.—Railway receipts for Dec., 1911, \$18,922.97, against \$17,822.31 for Dec., 1910.

Hamilton, Grimsby and Beamsville Electric Ry.—The annual meeting was held at Hamilton, Ont., Jan. 22. Following are the officers and directors for the current year:—President, Jas. Dixon; Vice President, John Dickerson; Treasurer, John Knox; Secretary, G. D. Fearman.

Montreal and Southern Counties Ry.—Montreal press reports Jan. 22 state it is regarded as almost certain that the M. and S.C. Ry. will before very long be absorbed by the Montreal Tramways Co. The M. and S.C. Ry. is practically owned by the G.T.R.

Montreal St. Ry.—Passenger earnings for Dec., 1911, \$425,164.02; miscellaneous earnings, \$5,774.65; total earnings, \$430,938.67; operating expenses, \$268,328.54; net earnings, \$162,610.13; city percentage on earnings, \$20,621.23; interest on bonds and loans, \$15,832.45; rental leased lines, \$607.49; taxes, \$5,000; total charges, \$42,061.17; surplus, \$120,548.96; expenses per cent. of earnings, 62.27, against \$371,691.09 passenger earnings; \$5,583.08 miscellaneous earnings; \$377,274.17 total earnings; \$235,209.36 operating expenses; \$142,064.81 net earnings; \$17,005.37 city percentage on earnings; \$15,384.22 interest on bonds and loans; \$552.50 rental leased lines; \$4,700 taxes; \$37,642.09 total

charges; \$104,422.72 surplus; 62.34 expenses per cent. of earnings, for Dec., 1910. Aggregate total earnings for three months ended Dec. 31, 1911, \$1,293,807.84; operating expenses, \$761,106.50; net earnings, \$532,701.34; total charges, \$113,075.89; surplus, \$419,625.45; expenses per cent. of earnings, 58.83, against \$1,130,060.17 aggregate total earnings; \$668,401.32 operating expenses; \$461,658.85 net earnings; \$101,653.23 total charges; \$360,005.62 surplus; 59.15 expenses per cent. of earnings, for same period 1910.

Montreal Tramways Co.—A press report says that the plan of amalgamation of the Montreal Tramways Co. and the Canadian Light and Power Co. has been decided upon and that the amalgamation will be effected by a holding company taking up the common stock of the two companies to be absorbed. The holding company will be the Montreal Tramways and Power Co., with a London, Eng., charter and a capital of \$20,000,000. The shareholders of the Montreal Tramways Co. and the Canadian Light and Power Co. will receive $1\frac{1}{2}$ shares of Montreal Tramways and Power Co. for each share now held by the shareholders. The holders of \$2,000,000 common stock of the Tramways Co. will receive \$3,000,000 of the consolidated company stock and the holders of the outstanding \$6,000,000 of Canadian Light and Power stock will receive \$9,000,000 of the consolidated company's stock. The Montreal Tramways and Power Co.'s outstanding capital will, therefore, be \$12,000,000 of the \$20,000,000 authorized.

Ottawa Electric Ry.—A bonus of 3%, in addition to the usual 2% bonus and 10% dividend, making a total of 15%, was paid to shareholders, Jan. 16, in respect of the past year's operations.

Winnipeg Electric Ry.—Gross earnings for Nov., 1911, \$355,825; working expenses, \$181,446; net earnings, \$174,379, against \$341,560, gross earnings; \$171,539, working expenses; \$170,021, net earnings for Nov., 1910. Aggregate gross earnings for 11 months ended Nov. 30, 1911, \$3,509,848; net earnings, \$1,778,002, against \$2,944,059, aggregate gross earnings; \$1,466,980, net earnings for same period, 1910.

Electric Railway Notes.

The Toronto Suburban Ry. has ordered two double truck cars.

The Calais (Me.) St. Ry. has discontinued the sale of school children's tickets.

The Winnipeg Electric Ry. has ordered 60 car trucks, complete with axles, in the United States.

The Canadian Street Car Advertising Co., Ltd., has surrendered its charter under the Ontario Companies Act.

The Calgary Municipal Ry. has received two single truck cars from the Preston Car and Coach Co., Preston, Ont.

The Galt, Preston and Hespeler St. Ry. has ordered two interurban cars from the Preston Car and Coach Co., Preston, Ont.

Superintendent Doughty, of the Regina, Sask., Municipal Ry., was presented by the employees with a gold locket, Jan. 1.

The Toronto Suburban Ry. is reported to have placed an order for motors and other car equipment with the Canadian General Electric Co.

Accident reports show that during 1911, 19 persons were killed on, or in connection with, the street railway in Toronto, and 28 in Montreal.

The Grand Valley Ry. has notified the Brantford, Ont., city council that it is

about to operate a freight service between that city and Paris, Ont.

The Buffalo, Lockport and Rochester Ry. is said to be considering plans for a station to be built near the Dodge opera house square in Buffalo, N.Y.

M. Urwin has been appointed Secretary, British Columbia Electric Ry., London, Eng., vice G. Kidd, appointed Comptroller at Vancouver, B.C., some time ago.

The Toronto and York Radial Ry. has ordered five interurban cars, and has received one double truck interurban car, from the Preston Car and Coach Co., Preston, Ont.

The city of Lethbridge, Alta., has ordered five single truck and five double truck cars, for its street railway, from the Preston Car and Coach Co., Preston, Ont.

The Dominion Power and Transmission Co., Hamilton, Ont., has ordered three double truck city cars from the Preston Car and Coach Co., Preston, Ont.

E. A. Macnutt, of the Sun Life Assurance Co., Montreal, has been appointed Secretary of the Western Railways and Light Co., of Champaign, Ill., succeeding J. B. Macauley.

E. Sterling, heretofore Trainmaster, British Columbia Electric Ry., New Westminster, has been appointed Local Manager, Lulu Island branch, vice G. H. Franklin, promoted.

During Nov., 1911, one fatal and five non-fatal accidents were reported in connection with the operation of electric railways in Canada. The fatality was due to a de-railment.

The British Columbia Electric Ry., during 1911, ordered the following additions to rolling stock:—58 passenger cars, 25 box cars, four electric locomotives, and one steam locomotive.

D. R. Kennedy, heretofore Superintendent of Electrical Construction, has been appointed Superintendent of Power and Lines, British Columbia Electric Ry., Vancouver, vice W. T. Woodroffe, resigned.

A bylaw providing for the operation of cars on the Winnipeg Electric Ry. in the municipality of Kildonan, Man., has been prepared and will be submitted for consideration at the February meeting of the council.

G. H. Franklin, heretofore Local Manager, Lulu Island branch, British Columbia Electric Ry., Vancouver, has been appointed Manager, Interurban Division, New Westminster, vice Allan Purvis, resigned.

The Berlin, Ont., Light Commissioners, operating the Berlin and Waterloo St. Ry., are purchasing two double truck, 45 ft., pay-as-you-enter cars, and are considering the advisability of establishing a 10-minute service between Berlin and Waterloo.

A British Columbia Electric Ry. motorman has been fined \$15 for not slowing down his car when it was passing another car that was discharging passengers in Vancouver. This is the second prosecution that has taken place under the B.C. Tramways Inspection Act.

The Lethbridge, Alta., city council has ordered from the Preston Car and Coach Co., Preston, Ont., five 41½ ft. car bodies on trucks, and five 32 ft. 10 in. car bodies on trucks at a cost of \$40,158; and from the Canadian Westinghouse Co. 10 complete equipments with air brakes for five cars at a cost of \$19,755.

C. D. Warren, of Toronto, is one of the directors of the Keokuk, Nauvoo and Fort Madison Electric Ry. Co., recently incorporated in Illinois, to build an electric railway from Keokuk, Ia., through Hancock county, Ill., with branches to

Nauvoo and Carthage. The head office is at Nauvoo, and the capital stock \$650,000.

W. T. Woodroffe, Superintendent of Power and Lines, British Columbia Electric Ry., Vancouver, has resigned on his appointment as City Electrician for Vancouver. W. H. Elson, Local Manager, B.C. Electric Ry., New Westminster, has also resigned, no appointment to that position having been made to Jan. 15.

Sir Rodolphe Forget, President, Quebec Railway, Light, Heat and Power Co., E. A. Robert, President, D. McDonald, General Manager, and Patrick Dubee, Secretary, Montreal Tramways Co., are associated with the Montreal South Land and Improvement Co., which has recently purchased about 950 arpents of land at Longueuil, on which it is reported a model city will be built.

F. Swayze, who has been conductor on the Niagara, St. Catharines and Toronto Ry., running between St. Catharines and Niagara Falls, Ont., is reported to have been appointed General Manager of the Niagara, Welland and Lake Erie Ry., which has done some track laying in Welland, Ont. It is said that construction will be continued to Niagara Falls, Port Colborne and other points.

The New York, New Haven and Hartford Rd. management is evidently satisfied with the electric operation of trains between Stamford and New York, 34 miles, as it is announced that the system is to be extended from Stamford to New Haven, 41 miles. The new equipment will be practically identical with that on the existing electric road. The estimated cost of the work is about \$4,000,000.

W. Rae, Inspector of Tramways, appointed by the British Columbia Government, has also been appointed Inspector of Railway Equipment by the Board of Railway Commissioners, to enable him to enquire into matters on electric railways, portion of which are under Dominion and provincial charters, as in the case of the B.C. Electric Ry. Co. He does not receive any salary from the Board of Railway Commissioners.

The Milwaukee Electric Ry. and Light Co. owns a hospital car, which, although designed primarily for taking care of passengers injured by street cars, has been used on many occasions by the city in cases where a number of people have been injured. It is fitted with two leather couches and it has a sink with water heated by electricity and electrically heated pads which are used in place of hot water bottles. It also has a case fitted with instruments and necessary appliances for first aid work.

The Guelph Radial Ry., which is owned by the city of Guelph, Ont., has been reorganized as follows:—Mayor, G. J. Thorp, Chairman; J. W. Lyon, J. W. Pequegnat, C. E. Howitt and W. E. Buckingham. On account of being opposed to the extension of the line to the city limits in St. Patrick's ward, J. J. Drew, K.C., who has been a member of the board since its formation, resigned, and the Treasurer, G. B. Ryan, also resigned for that and other reasons.

A circular issued by Sir Rodolphe Forget, President, Quebec Ry. Light, Heat and Power Co., announces that H. G. Matthews, heretofore Assistant to the President, has also been appointed General Manager, vice C. E. A. Carr, resigned. Another circular issued by W. G. Ross, President, Quebec Ry. Light and Power Co., announces that Mr. Matthews has been appointed to a similar position in that company. The Quebec Ry. Light, Heat and Power Co. is the holding company, the railways being operated by its subsidiary, the Quebec Ry. Light and Power Co.

Electric Railway Projects, Construction, Betterments, Etc.

Brandon, Man.—The city council received up to Jan. 16 offers for the franchise for an electric railway in the city, which are now under consideration. (Jan., pg. 38.)

The British Columbia Electric Ry. laid 29 miles of new track in 1911, exclusive of the reconstruction of part of the existing tracks on account of new paving on 11 miles of streets, and new part track on new paved streets for 2.5 miles.

Negotiations are in progress for a settlement of the Point Grey franchise difficulty, but in the meantime the company is appealing against the recent judgment declaring the franchise valid.

A proposition has been made by certain interests on Nanaimo St., Vancouver, to offer the company a bonus of \$55,000 for the building and operation of a line from Hastings St. to Broadway, about 18 blocks. (Jan., pg. 38.)

Buffalo and Fort Erie Ferry Ry.—A proposition is under consideration by which the company will build a line from Crystal Beach to Port Colborne, Ont., connecting there with the Niagara, St. Catharines and Toronto Ry. The proposal is that the latter company shall operate the line as a part of its system. The B. and F.E.F. Ry. also proposes to build a second track on its line between Crystal Beach and Fort Erie. (See Fort Erie Ferry Ry., Feb., 1910, pg. 147.)

Calgary Municipal Ry.—A bylaw authorizing the expenditure of \$442,000 for various works, including the extension of the railway to the site of the C.P.R. shops at Maharg, 4½ miles east of Calgary station, was approved by the taxpayers at the recent elections. (Jan., pg. 38.)

Calgary to Shepard, Alta.—The Alberta Legislature is being asked to incorporate a company to build an electric railway from Calgary to Shepard, Alta. Lathwell and Waters, Calgary, are solicitors for applicants.

The Dunnville, Wellandport and Beamsville Electric Ry. Co. is applying to the Dominion Parliament to extend the time within which the lines authorized may be built, and also to declare that the company may use other motive power than electricity. J. R. Roaf, Toronto, is the solicitor. (Oct., 1911, pg. 973.)

Humber Valley Electric Ry.—Application is being made to the Ontario Legislature to incorporate a company to build an electric railway from Dundas St., Lambton Mills, Ont., southerly to the Humber River, thence to Bloor St., crossing the river, and thence southerly along the east bank of the river to the Lake Shore road at Humber Bay, and easterly along the Lake Shore road to Sunnyside Ave., with power to build branch lines, and to make connections with other lines. W. H. Price is solicitor for applicants. The railway is projected as a part of the plans for the development of the Humber Boulevard property of which R. Home Smith, of Toronto, is the promoter.

Kawartha Transportation Co.—The Ontario Legislature is being asked to incorporate a company with this title to build an electric railway from Peterboro, through Lakefield, to Clear Lake, thence to Stony Lake, to Apsley, Ont.; from Peterboro to Cobourg Lake and from Peterboro to Rice Lake, Ont. Hall, Hayes and Hall, Peterboro, Ont., are solicitors for applicants.

Lethbridge, Alta.—Following the approving of the bylaw authorizing the building of an electric railway as a municipal undertaking, the city council Jan. 10 authorized the purchase of a site for a car barn, the erection of the neces-

sary structure, and appointed Superintendent Reid as General Superintendent of the Power, Light and Street Railway Department. At a previous meeting additional equipment for the power house, in order to provide for the operation of the railway, was ordered. Contracts have been let for the paving, steel rails, materials for overhead work, car equipment, etc., all for speedy delivery. (Jan., pg. 38.)

London Street Ry.—Local press reports state that a definite proposition will be made by the company to the London, Ont., city council for the taking over of the lines. The franchise does not expire until 1925, but as the company must make a considerable expenditure upon betterments and extensions it is thought that the present is a favorable time for a change in ownership. The price put on the property is stated to be \$800,000. (Jan., pg. 38.)

The Monarch Radial Ry. Co. is applying to the Ontario Legislature to extend the time within which the projected railway may be built; to increasing the bonding power from \$25,000 to \$30,000 a mile; and to change its name to the Toronto, Barrie and Orillia Ry. Co. Lennox and Lennox, Toronto, are the solicitors. (Dec., 1911, pg. 1171.)

Moncton Tramways, Electricity and Gas Co.—The line built and placed in operation by this company extends from King St. to John St., Moncton, N.B., two miles. (Jan., pg. 38.)

Montreal Tramways Co.—The Quebec Legislature is being asked to confirm the amalgamation of the Montreal Street Ry. and its various subsidiary companies under the title of the Montreal Tramways Co. The city council decided Jan. 13 to ask that the bill be not considered by the Legislature's committee before Feb. 15 in order that the city may be heard in opposition. The Provincial Secretary has authorized the M.T. Co. to do business in the province of Quebec, with E. A. Robert as its principal agent. (Jan., pg. 39.)

North Midland Ry.—The St. Marys, Ont., ratepayers have ratified a bylaw granting \$5,000 in aid of the building of the N.M. Ry. into the town. London, Ont., ratepayers have ratified a bylaw granting the company a bonus of \$25,000. (Jan., pg. 39.)

Owen Sound, Ont.—A conference has been arranged with the town council in connection with a proposal to establish an electric storage battery car line in the town. (Dec., 1911, pg. 1173.)

Ontario West Shore Ry.—A meeting of the representatives of the town and township municipalities which guaranteed the bonds of this company was held in Goderich, Ont., Jan. 12, to consider the position. The four municipalities interested guaranteed the interest on \$400,000 of bonds, on condition that an additional \$200,000 was expended upon construction. About 15 miles of the line has been completed from Menezet, across the river from Goderich in the direction of Kincardine, but it is not being operated. The municipalities have been called upon to pay an instalment of interest. A suggestion has been made that the municipalities take over the line, complete it and operate it as a municipal work. A report is current that the C.P.R. has been considering the taking over of the line. J. W. Moyes, Toronto, is President. (Dec., 1911, pg. 1171.)

Quebec Ry., Light and Power Co.—Press reports state that the company has secured the water power rights on the first 30 miles of the Saguenay River out of Lake St. John, Que., and that it is proposed to develop 50,000 h.p. for industrial purposes in Quebec and district. (Jan., pg. 39.)

The Rainy River Radial Ry. Co. is asking the Dominion Parliament to ex-

tend the time within which the lines of railway authorized to be built by chap. 152 of the statutes of 1910, may be built. Machin and Ap'John, Kenora, Ont., are the solicitors. (Mar., 1910, pg. 233, and June, 1910, pg. 433.)

The Rennell Sonnet Development Co., which is incorporated under the British Columbia Companies Act, is applying to the B.C. Legislature to authorize it, among other things, to build tram lines on Graham Island.

The Rural Ry. Co. of Manitoba is asking the Manitoba Legislature for power to amalgamate with other similar companies. Mulock, Loftus, Armstrong and Lindsay, Winnipeg, Man., are the solicitors. (June, 1911, pg. 577.)

St. Thomas St. Ry.—A bylaw authorizing the expenditure of \$210,000 for the extension of the municipally owned electric railway in St. Thomas, Ont., to Port Stanley, Ont., was defeated by a large majority at the municipal elections Jan. 1. (Jan., pg. 39.)

Toronto Civic Car Lines.—A bylaw providing for the building of a tube railway to be operated by electricity from Front St. to St. Clair Ave., along Bay Terauley and Yonge Streets, was defeated by a majority of about 3,000 at the civic elections Jan. 1. (Jan., pg. 40.)

The Toronto Suburban Ry. Co. is asking the Ontario Legislature for an extension of time for the building of the company's lines and extensions; for authority to build an extension from near Guelph to near Berlin, Preston, Hespeler and Galt., thence to Hamilton; for the insertion after the words county of Peel in sec. 1 of the Act of 1910, the words "or from some point on its authorized Hamilton line at or near Cooksville"; for power to increase the capital stock and for authority to issue debenture stock for the purpose of providing bridges, terminals, station houses, generating plants, etc.

The York tp. council, Jan. 15, granted permission to the company to extend its line from the northerly limits of Weston village to the northerly limits of the township. The plans show a line running along the Weston road for 0.6 of a mile, and then across country by a private right of way to Woodbridge. The extension will be between nine and ten miles. The surveys for the extension of the Lambton line, which were completed some time ago, mainly on a private right of way as far as the Etobicoke River, have now been extended into Peel county. Crossing the Etobicoke River, the surveyed route gets to the south of Dundas St. just west of Summerville, and continuing on a private right of way gets to the C.P.R. near Dixie station and runs alongside the steam railway tracks to Cooksville station, whence it strikes northwesterly. Surveys for several routes beyond this have been made. It is said that work will be gone on with on the extension to Woodbridge, and the extension from Lambton as far as the crossing of Dundas St., at the C.P.R. tracks, Cooksville, this season. (Dec., 1911, pg. 1173.)

Winnipeg Electric Ry.—The question of the further extension of the company's lines is under consideration, but it is not expected that any announcement will be made until shortly after the annual meeting, which is fixed for Feb. 14.

The St. Boniface city council has approved of several extensions of lines in the city which are to be completed by July, 1913.

A bylaw to raise \$25,000 by debentures for a power distribution plant, and another for the purchase of 100 h.p. electric power from the Winnipeg, Selkirk and Lake Winnipeg Ry., have been approved by the taxpayers of Selkirk, Man. The W.S. and L.W. Ry. is a subsidiary of the W.E. Ry. (Jan., pg. 40.)

Marine Department

The Grand Trunk Pacific Ry. Marine Terminal, Prince Rupert.

By F. E. Kirby and W. T. Donnelly, Members of the Society of Naval Architects and Marine Engineers.

When, in 1910, the authors of this paper were retained to visit the Pacific Coast for the purpose of studying the shipping and marine repair facilities and to visit Prince Rupert, the western terminus of the Grand Trunk Pacific Ry., they were at a loss how to proceed, for not only was Prince Rupert

through the narrow waterways which were literally the submerged valleys of the Coast Range, they arrived on the evening of the third day in Prince Rupert harbor and were, for the first time, fully convinced that such a location actually existed.

Those who are especially interested

posed to be unnavigable. Actual surveys show it to be one of the most easily entered and satisfactory harbors on the Pacific coast. The entrance, which is from the south, is about three-eighths of a mile wide. It is entirely unobstructed with a depth of water nowhere less than 20 fathoms. The entrance may be said to extend northward for three miles, when the harbor is reached, extending north-east for four miles, with an unobstructed width of from one and a half to three-quarters of a mile.

The city of Prince Rupert is located on Kaien Island, which forms the right of the entrance, and the southeast of Prince Rupert harbor. The city proper is laid out over an area three and a half miles long by one mile in breadth, on the shores of the island, with a background rising to an elevation of from 1,600 to 2,000 ft., the general characteristics reminding one very forcibly of the city of Montreal with Mount Royal behind it. The G.T.P.R. will reach the coast by the Skeena River valley, about 15 miles to the south, and crossing to Kaien Island at its southern end, will closely follow the shore to and along the water front of Prince Rupert.

The general character of the shore of Prince Rupert is bold and rocky, falling off very rapidly to a depth of approximately 20 fathoms. A careful exami-

Drydock, Ship Repair and Shipbuilding Plant, as they will appear when completed.

beyond their geographical knowledge, but it also failed to appear upon any available map or charter. However, with an abiding faith in the G.T.P.R. they undertook the commission. Proceeding to the Pacific coast over the

and desire to extend their geographical knowledge, are referred to the most recently published charts of the Northern Pacific and Alaskan coasts, on which Dixon's Entrance, north of Graham Island between 54 and 55 degrees north

follow the shore to and along the water front of Prince Rupert.

The general character of the shore of Prince Rupert is bold and rocky, falling off very rapidly to a depth of approximately 20 fathoms. A careful exami-

Fig. 1. Location of Drydock, Ship repair and Shipbuilding Plant, Prince Rupert.

Northern Pacific Ry., they visited Portland, Seattle, Tacoma and Bremerton in the U.S., and Victoria, Vancouver and New Westminster, B.C., finally proceeding from Vancouver on a C.P.R. steamship northward through the Inland passage, and after three days steaming

latitude, can be readily located. To the east of Dixon's Entrance, Brown Pass leads to Chatham Sound and across this to the east, between Digby and Kaien Islands, is found Prince Rupert harbor. So hidden away and unprepossessing is the entrance that until 1906 it was sup-

position of the entire length of the harbor front of Kaien Island determined Hays Cove as the only practical place for such a development as was contemplated; that is, a floating dry-dock of 20,000 tons lifting capacity, so designed as to be capable of operating in sections as

a number of smaller docks, an adequate shore plant comprising electric power generating plant with air compressors, machine shop, boiler and blacksmith shop and covered construction shed under which the pontoons of the floating dry-dock could be built.

The dock is to be of such a design and construction as to be almost entirely built upon the site. To accomplish this, the general plan provides for the practical completion and equipment of the shore plant before the dry-dock is commenced.

One of the controlling features in the general plan of this development was the fact that Prince Rupert will be 600 miles from the nearest base of supply or point where any considerable assistance, mechanical or otherwise, can be obtained. It was, therefore, determined at the outset that the mechanical equipment, large tools, etc., must be of the very best and most complete. Also, that on account of the high price of labor on the Pacific coast, ample provision for the use of power in every way possible should be made. This has resulted in the design of an electric power generating station with ample capacity for all present needs and with a large possibility of extension.

As the plans were laid out in such a manner as to make the development progressive, constructing those parts first which could, when completed, be used in the construction of the remainder, this outline will be followed in the description.

Fig. 1 gives a general plan of the plant, showing location of dry-dock, piers and buildings.

PIER AND PLATFORM WORK.—The first work to be undertaken will be the pier, marked "Pier no. 1" on the general plan. This will be 420 by 60 ft., the piling being on 10 by 5 ft. centres. The pier will require about 600 piles.

At the same time, there will be built the platform at the shore end of this pier 80 by 930 ft., having an area of 74,400 sq. ft., and will require about 1,600 piles on 5 by 10 ft. centres.

At the western end of this platform there will be an extension off shore 350 by about 100 ft., and at right angles to this, an extension 560 by 80 ft. for the attachment of the floating dry-dock. A double line of diagonal bracing is used in the pile work. This is on account of the excessive rise and fall of tide, which for spring tide is 25 ft. The tops of the piles are thoroughly secured by double 6 by 12 clamps and connected by 12 by 12 caps. The decking is to be of 4 by 12 planking. Piles are to be creosoted. The total area of the platform and pier work will be 181,400 sq. ft. The completion of this work, it is expected, will provide ample space for the landing and handling of materials for the rest of the plant.

LAUNCHING PLATFORM.—In front of the main platform, east of the pier, there will be built a launching platform for side launching. This will be 80 by 440 ft. and will be carried on 16-in. piles on 5 by 10 ft. centres, braced and reinforced by heavy piling along the edge, over which the launching will take place. The general arrangement and bracing of this piling can be seen by referring to fig. 2, showing the platform in connection with the building shed. It will be noticed that the outer half of the building platform has a slope of $1\frac{1}{4}$ ins. to the ft., which is approximately the launching grade for side launching.

POWER HOUSE.—The general location of the power-house will be seen by referring to fig. 1. Electric power is to be furnished for operating the pumping machinery of the floating dry-dock, for compressing air and to operate machinery in the various shops; also, for furnishing electric lighting for the plant. The building is to contain both boilers

and power plant under one roof with fireproof dividing walls, and is to be 104 by 148 ft., having a covered area of 15,392 sq. ft. It will be of modern steel-frame construction, the walls and roof to be of reinforced concrete.

There will be installed 6-400 h.p. water tube boilers, supplied with automatic stokers, chain-grate type, such as are known to give good satisfaction with Pacific coast coals. Provision is made for adding two extra boilers. There is also a provision for the installation of an economizer, in case it is found that the load factor warrants the expense. Draught will be obtained by a steel or concrete chimney 175 ft. high and 11 ft. in diameter. An overhead trolley is provided for handling coal from storage to hoppers above the stokers and also for handling ashes.

COAL HANDLING AND STORAGE.—Provision is made for receiving coal both by water and rail. Coal by water will be received at the outer end of the pier, for the unloading of which there is provided a standard grab-bucket installation, so arranged as to load cars beneath the hoppers, the cars to be handled by small yard locomotives to

These machines are to be direct current, 220 volts. There is also to be a motor-driven exciter of 25 k.w. capacity, the motor for this machine to be a 35 h.p., 3-phase, 25-cycle, 550-volt alternating current squirrel-cage-type motor.

CRANES.—There will be provided for the erection of this machinery in the power plant, a 15-ton overhead travelling crane. This will be operated by electricity and the current supplied will be from one of the steam-driven exciter sets.

AIR COMPRESSOR.—For furnishing compressed air to the shops of the plant, there will be provided a compound Corliss air compressor having a displacement of 1,580 cu. ft. of free air per minute when operating at 150 revs. This compressor is to be designed for a steam pressure of 175 lbs. per sq. in. and for an air pressure of 100 lbs. The distribution of the air will be by means of underground piping through the yard.

SWITCHBOARD AND DISTRIBUTION SYSTEM.—The entire system of light and power throughout the plant is to be controlled from the switchboard located on the main floor of the power-house. The switchboard is to consist of 15 panels.

Fig. 2. Cross Section of Ship Shed, Prince Rupert.

the coal pocket of 1,000 tons capacity, located adjacent to the boiler house. Coal received by rail will be delivered direct from the G.T.P.R. cars, which pass at the rear of the property, to the coal pocket approached by an incline.

MAIN ENGINES.—There will be two main engines of 900 h.p. each, and while vertical reciprocating compound engines are specified, using steam at 175 lbs. pressure and 258 r.p.m., turbine engines will be considered as an alternative.

CONDENSERS.—Jet condensers are planned, but alternate figures will be taken for service condensers. The type to be used will depend upon local conditions as to the cost of water at the time of installation. Condensing water will be obtained through the rock cutting and shaft sunk within the power-house, the circulating water being handled by a vertical centrifugal pump operated by an electric motor.

GENERATORS.—Electric generators are to have a capacity of 600 k.w., 3-phase, 25-cycle, 550-volt alternating current. For these generators there will be provided two steam-driven exciters, one of 50 k.w. and one of 25 k.w. capacity.

The construction throughout is to be most substantial and thorough, fully meeting the best standards of central station distribution.

CUT AND FILL AND FOUNDATIONS.—By referring to fig. 1, showing the natural conditions of the site, it will be seen that the ground is very difficult, all the property either having to be cut down or, raised to grade by fill. The location of the power-house was determined by the condition of the ground, which, at this location, is of rock which will have to be reduced to the grade required. The cut and fill work is intended to go forward at the same time as the pier work, and the power plant will be commenced as soon as the site can be levelled. The rock cut for the power-house and yard grading will amount to 18,000 cu. yds., the rock fill for retaining walls, 57,000 cu. yds., and the earth fill for grading, 73,000 cu. yds. The dredging between the pier and dry-dock bulkhead will amount to 100,000 cu. yds. to obtain a depth of water of 20 ft. at low tide.

BOILER AND BLACKSMITH SHOP.—The combined boiler and blacksmith shop is to be 76 by 150 ft., the central part to be 33 ft. wide, provided with a 15-

ton travelling crane. The design is of the usual steel-frame shop construction with side bay, and will, in this instance, be covered with wood. The flooring will be of concrete with heavy foundations for the large tools. The tool equipment will be very complete, comprising heavy punch and shears, rolls, plate planer, flanging clamps, etc., heavy steam-hammer and a full equipment of blacksmiths' tools.

THE MACHINE SHOP will be constructed from the same set of plans as the boiler and blacksmith shop. The flooring will be of concrete with special foundations for large tools. Ample provision is made for thorough lighting and the building will be steam-heated throughout. A very complete equipment of machine tools will be provided, comprising all machinery necessary to handle the heaviest crank and other shafting of large steamers; also, boring, drilling and turning machinery for repairing all the secondary machine equipment of steamships. Large tools will be driven

development, the possibility of shipbuilding was carefully considered, and while there is no immediate prospect for the building of steel vessels so far from the base of material, it was thought advisable, in preparing for the building of the pontoons under cover, to make the construction of a permanent nature, suitable for shipbuilding, to be used in the immediate future for wooden shipbuilding and later on for steel shipbuilding. To accomplish this, the building shown in fig. 2, has been developed. This building is located over the launching platform and over part of the general platform extending eastward from pier 1, with foundations carried down to rock.

It will be seen from the general plan, fig. 1, that the property is laid out for side launching, this being the only practical development that was possible under existing natural conditions. The building about to be described is the result of these conditions. While side launching is unusual in Europe and

reserved until the last from the fact that, as previously stated, it is to be almost entirely constructed at and by the plant of which it is to be the principal feature.

This dock is to have an over-all length on keel blocks of 604 ft. 4 ins., a clear width of 100 ft., and a width over-all of 130 ft. The lifting power is the aggregate of 12 pontoons of timber construction, each 130 ft. long corresponding to the width of the dock, 44 ft. wide in a direction corresponding to the length of the dock and 15 ft. deep. These pontoons are to be united by steel side walls or wings 38 ft. high, 15 ft. wide at the bottom, and 10 ft. wide at the top, the walls being divided so that the whole structure may be used under ordinary conditions as three separate docks, one of six pontoons, with an over-all length of 269 ft., and two of three pontoons each, with an over-all length of 164 ft. each. The largest commercial ship upon the Pacific Coast at the present time is the Minnesota, the

Fig. 3. Twenty Thousand Tons Pontoon Floating Drydock, Section Type.

general in America, it is practically universal on the Great Lakes, and the general design of this structure is the result of experience there.

The shipbuilding portion of the structure is designed to have a covered width of 86 by 300 ft., with a clear height under cranes of 50 ft. and under girders of 56 ft. The shop section of this building is to be 80 by 300 ft. The ground floor will be used for machinery and the upper floor will be used as a laying-out floor. The equipment of woodworking machinery will be most complete, comprising large re-saw band saw, timber sizer, rip and crosscut saws and other woodworking and finishing machinery.

ADMINISTRATION BUILDING.—There will be an office and administration building 40 by 100 ft., constructed of wood two and a half stories high. This will be fitted up with draughting room, accounting and bookkeeping department and private offices. The exact location of this building has not been determined, as this will depend largely upon the opening and grading of streets approaching the property.

TWENTY THOUSAND TON PONTOON Floating Dry-dock.—Referring to fig. 3, there will be seen the general design drawing of a 20,000-ton pontoon floating dry-dock, description of which has been

outline of which is shown on the dock. This vessel would have a dead weight in ordinary unloaded condition of approximately 18,000 tons.

The machinery for pumping the dock will consist of centrifugal pumps operated by electric motors, the capacity of the equipment being sufficient to pump the entire lifting power of the dock in less than two hours. A detailed description of the pumping machinery will be given later.

The structure as a whole is secured to the shore by the engagement of clamps on the dock with a vertical truss secured to the pile platform or pier in such a way that it is free to rise and fall with the tide, and when being raised or lowered with a ship. The location of these attachments is such that when it is desired to use the dock in three separate sections, the bow section may be detached and moved around the corner of the pier work located as shown on the general plan alongside the platform, and secured in the same manner as provided for in its original position. To make the other two sections available as separate docks, it is only necessary to detach the middle section, comprising six pontoons, from the pier work and advance it the length of the detached section, when the sliding clamps upon the wings will coincide

en by individual motors, the smaller tools being arranged for group driving. A 15-ton overhead travelling crane will be provided for both boiler and machine shops. The building will be supplied with compressed air and a special room will be fitted up for the repair and care of air tools.

By referring to fig. 1, it will be seen that the location of the machine shop is such that ready access may be obtained from the dry-dock and water front, and it will be noticed that provision is made for entering the boiler and machine shops with railway cars. Provision is also made for the extension of these shops as the business develops.

BUILDING SHED AND WOODWORKING SHOP.—On account of the excessive rainfall in Prince Rupert, it will be necessary to do the work of building the pontoons for the floating dry-dock under cover.

In laying out the general plan for the property and in view of its future

with those used for the previous section when the dock was operated as a whole. This will allow ample space between the centre and stern sections for the overhang without interference of vessels which may be docked on them.

As the feature of a sectional dock to be used as a whole or separately is somewhat new, it is desired to call attention to the fact that the three largest commercial docks in the United States, namely, the 10,000-ton floating dry-dock of the Tietjen and Lang Dry-Dock Co., built in 1900; the 12,000-ton dock of the Moies Dry-Dock Co., built in 1902 (both in New York harbor), and the 10,000-ton dock of the port of Portland, Oregon, are sectional docks in five sections each. All of these docks are of timber construction, and are giving excellent service.

PONTOONS.—As previously stated, the pontoons for this dock are to be 12 in number, constructed entirely of timber. They are to be 130 ft. by 44 ft. by 15 ft. deep, with a crown of 3 ins. at the centre, and will have 15 trusses spaced on 3-ft. centres. There will be a centre water-tight bulkhead 12 ins. thick, and above this bulkhead the centre will be reinforced for carrying keel blocks. There will be three partial bulkheads on each side to stiffen the pontoons. All diagonal braces are heavily reinforced with anchor stocks. The arch brace is made up of planking through-bolted with screw bolts, and is intended to take the reverse stresses when the dock is floating light. This is a considerable amount when it is considered that the wings are superimposed weights carried at the extreme ends of the trusses, supported by an evenly distributed pressure over the entire bottom. Six by 12-in. deck beams are worked across the upper and lower truss members, carrying the 5-in. deck and bottom planking parallel to, and reinforcing the truss members for the maximum stress. This construction also makes it possible to get in double vertical tie rods alongside of bulkheads in such a manner that they may be replaced at any time. The whole structure is made water-tight by caulking with white pine wedges.

To protect the exterior from teredo and other marine worms, it is first thoroughly grained with tar poisoned with arsenic, then sheathed with two layers of hair felt, each thoroughly saturated with tar and arsenic, and then with creosoted lumber, also treated with arsenic and thoroughly secured with galvanized nails. This treatment, together with the facility for inspection afforded by the possibility of detaching and docking any pontoon, has been found to give satisfactory protection.

Each pontoon will require approximately 330,000 board ft. of lumber or a total, including outrigger or prow on the end pontoons, of 4,000,000 board ft. The entire bill of lumber will be of selected grade of Oregon pine or Douglas fir.

As previously stated, it is the intention to have these pontoons built upon the launching platform under the building shed, using the tools and equipment provided for the plant. Sufficient room has been allowed to build three pontoons at the same time. As soon as they are launched they will be moved into the basin between the pier and dry-dock platform and temporarily united together in correct relative position by timber clamps, when they will be ready for the erection of the steel wings.

THE STEEL WINGS consist of channel and angle frames on 3-ft. centres corresponding to the trusses of the pontoons, and a covering of plating varying in thickness from $\frac{1}{2}$ to 5-16 in. The construction is greatly facilitated by reinforcing the plating against water pressure on the outside by horizontal angles. This does away entirely with troublesome intercostal connections and gives

the material used very much greater value in the construction as a whole.

There will be required about 2,200 tons of steel. Where the wing meets the deck of the pontoon there is a steel shoe secured to the frame of each pontoon and a corresponding shoe riveted to each frame of the wing. These are connected together by a steel link about 15 ins. long and pins, the upper one of which is tapered $\frac{1}{2}$ in. to the foot. The driving of this pin wedges the pontoon and wing together. At the point of contact, the bottom of the wing is reinforced by a 12 x $\frac{1}{2}$ in. plate and made water-tight by canvas packing saturated with red lead. On the outer side of the wing the method of securing is similar, except that the shoe on the pontoon is replaced by a cast-steel strap through-bolted to the pontoon.

Provision is made for multiple punching on uniform centres of 3 ins. and 6 ins. throughout, and the intention is to have the material fabricated in Europe or the eastern part of the United States, all frames assembled and shipped by water to Prince Rupert. The erection of the first section is to be commenced as soon as the first three pontoons are launched, the compressed air machinery of the plant being used for pneumatic riveting.

PUMPING MACHINERY.—The dock will be pumped by 24 12-in. centrifugal pumps, one in each end of each pontoon. The pump suction will take water from the bottom of the pontoon, the suction being protected by a liberal area of screen. Delivery will be directly through the flood-gate used in lowering the dock.

The pumps will operate at approximately 275 r.p.m., being driven by a vertical shaft. All the pumps on each side of each section will be driven through gearing and horizontal shafting by one electric motor, as shown in fig. 3. A jaw coupling is provided in the wing at about the level of the top of the pontoon for disconnecting the vertical shaft when the pontoon is removed for self-docking.

There is also an indicator for determining the level of water in the wings. This consists of a counterweighted float in vertical guides and a vertical rod extending through the deck of the wing. As the water enters the wing, the float rises and the height of the rod above the deck will indicate the depth of the water in the wings.

A similar device is provided to show the depth of the water in the pontoon. The flood-gates are operated to control the lowering of the dock and also to control the pumping collectively and individually of the different pumps, it being understood that with the pumps running, no water will be delivered if the flood-gates are entirely closed, and that, by a regulation of the gates without altering the speed of the pumps, any degree of control or any distribution of control can be accomplished. In case one side is rising too rapidly, the partial closing of the gate on that side, without disturbing the operation of the machinery, will effect the control, or the gates may be left at the same opening and the machinery stopped.

By this method, a much quicker and more powerful control may be obtained, as not only will the discharge of water from the dock stop, but will immediately commence to enter, thus doubling the power of control which would be obtained by closing the gates.

ELECTRICAL EQUIPMENT.—As previously explained, the group of pumps on each side of each section of the dock will be operated through horizontal and vertical shafting by one electric motor. Thus, for the two smaller sections of three pontoons each there will be required four 100 h.p. motors, and for the larger section of six pontoons there will be required two 200 h.p. motors. The

motors are to be alternating current, 3-phase, 25-cycle, 550 volt, and will operate at approximately 500 r.p.m. They are to have wound rotors and slip rings for variable speed control. The armature shaft is to be extended both ends and will operate the distribution shafts through reduction gearing at a speed of approximately 245 r.p.m.

There will be two motors on each section, one on each wing. The power circuit on the pier is connected to the power circuits on the sections by flexible cables. The power circuits of each section are independent from the main circuit, so that each section receives its power independently, but the control system is to be so arranged that the two motors on any section may be operated from one master panel or the combination of any two sections may be operated from the master panel on either of the two sections, and lastly, when all three sections are used together, all six motors are to be controlled from the master panel on the middle or larger section.

THE MASTER PANEL is to consist of a panel or drum having suitable contacts or switches for independently starting or stopping any of the motors. The starting or stopping of any one motor or a number of motors will not affect other motors at rest or in operation. The provision is also to be made for operating any or all motors at one-half, three-quarters and full speed.

COMPRESSED AIR EQUIPMENT.—While steam-driven air compressors are provided in the power plant to furnish compressed air for the shops, it was deemed advisable on account of difficulty due to the extreme rise and fall of tide, to make flexible air connections to the floating dry-dock and to provide an electrically driven air compressor upon each section.

On one side of each section there will be provided an electrically driven air compressor having a capacity of 500 cu. ft. per min. The air will be delivered to a receiver in the wing below, and from this to air piping carried along the bottom to each side of the wing, with multiple outlets for the connection of air hose to the pneumatic tools. Provision will also be made for connection between the sections of the dock when they are operating together.

Electric current for operating the air compressors will be taken from the circuits supplying the motors for pumping the dock, and as air will be used only after the dock is pumped up, the capacity of these circuits will be more than ample.

OPERATING EQUIPMENT, BILGE BLOCKS, Keel Blocks, etc.—The keel blocks are to be of oak 12 x 16 ins. x 4 ft. long, and are to have a height of 4 ft. The bilge blocks are to be on about 12-ft. centres, and operated according to the usual American practice by means of a galvanized chain on the floor of the dock and a leading rope through 6-in. sheaves secured to the wing near the deck, leading up and returning over the pipe railing around the tops of the wings. The return rope leads to the tail dog and is used in tripping the dog and pulling the block out when the ship is leaving the dock. The bilge blocks are provided with an elevating screw which has been found to be of great service for removing blocks one at a time for painting.

In the American practice of handling floating dry-docks, side shoring is not used. There is a general practice, however, of using centring rams for locating and steadying the vessel in position until firmly at rest upon the keel and bilge blocks. The arrangement of these rams can be seen in fig. 3, showing the general design of the dock.

ILLUSTRATIVE DISPLAY DRAWING.—There is submitted herewith an illustrative

Lake Grain Shipments, 1911 Crop.

The following statement, prepared by F. Symes, Acting Grain Inspector, Fort William Ont., shows the bushels of grain shipped from the different elevators at Fort William and Port Arthur of the 1911 crop, from Sept. 1 to close of navigation, 1911, with ports of destination. The last two figures in each column after the period, represent lbs.

(Continued on page 98.)

Notes on the Panama Canal Work and Future Operation.

The original estimated date for the completion of the Panama Canal was Jan. 1, 1915. The work has advanced so rapidly that it has become apparent the canal can be used at least a year earlier than this date. In order to determine the approximate time when shipping could pass through, a board was convened during the past year, composed of those charged with the work in progress and contemplated, and their conclusion is that the canal will be ready by July 1, 1913.

At all of the locks, fender chains are to be placed 500 ft. above and 230 below the upper and lower guard gates. When in use, they will be raised to the surface of the water, forming a barrier to the passage of ships. When it is struck by a vessel, the chain pays out against a resistance provided by hydraulic cylinders. The energy of a 10,000-ton ship moving four miles an hour will be absorbed after it strikes the chain before it reaches the gate.

Contracts for emergency or movable dams to check the outflow of water should the gates be carried away, have been awarded. Studies are being made of an electrical plant for operating the canal after completion. A scheme for lighting the canal has been adopted.

Ships will not pass through the locks under their own power. Each ship will be taken in hand by four powerful electric locomotives, one off each bow and one off each quarter. The locomotives will each weigh 70,000 lbs. They will be driven by electric motors operating gears which will engage a rack rail, and the hawsers from the ship will be attached to the windlasses of the locomotives, which will be provided with friction clutches, that will prevent the drums sustaining a pull of more than 25,000 lbs. The speed of the ships, when in tow of the locomotives, will be not over two miles an hour. The provision of rack rail traction, and the power and number of the locomotives, combined with careful operation, will practically eliminate any risks to the locks during the passage of vessels.

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

128. Dec. 29.—355. Quebec, Gulf of St. Lawrence, Magdalen islands, position of Alright reef bell buoy. 356. Quebec, River St. Lawrence below Quebec, chart of South Traverse issued. 357. Newfoundland, south coast, Fortune bay, Fortune town, range lights established. 358. Newfoundland, east coast, Melrose, Ragged harbor, range lights established. 359. Newfoundland, south coast, Placentia bay, Flat islands, Davis island, light to be established. 360. Newfoundland, south coast, Fortune bay, Fortune, light established.

129. Dec. 30.—361. Nova Scotia, southwest coast, Cape Sable, intended change in position of southwest ledge gas and whistling buoy. 362. Nova Scotia, south coast, off Bassoon reefs, bell buoy established. 363. Nova Scotia, Cape Breton island, St. Patrick channel, Baddeck harbor, Kidston island, new lighthouses.

1. Jan. 1. 1. General, important notice, true bearings to be introduced.

2. Jan. 10. 2. Nova Scotia, Bay of Fundy, entrance to Digby gut, Point Prim light station, new fog alarm building, change in fog alarm.

3. Jan. 12. 3. British Columbia, Vancouver Island, southeast coast, entrance to Victoria harbor, McLoughlin Point, fog alarm established.

4. Jan. 18.—4. Ontario, Lake Ontario, north side, chart of Presqu'île bay issued.

5. Ontario, Lake Superior, Michipicoten island, east end, lighthouse established.

Atlantic and Pacific Ocean Marine.

Capt. John Henderson, commander of the Allan Line s.s. Pomeranian, died at sea, Dec. 31, while en route to St. John, N.B.

A press report states that the C.P.R. will probably discontinue its steamship service between Canada and Bristol, Eng., shortly.

The C.P.R. has lowered its third class fare between Antwerp, Belgium and St. John, N.B., by 25 francs, commencing Jan. 1, making it now 175 francs.

J. T. Walsh, Marine Superintendent, C.P.R., Montreal, it is reported, will be appointed harbor master there, commencing his duties May 1, vice James McShanne, who will retire on a pension.

The s.s. Cape Breton has been chartered by Dodwell and Co., to load freight at Vancouver for Japanese and Chinese ports. She was expected to arrive at Vancouver from the Orient at the end of January.

The Canada West India Co., Ltd., recently incorporated with \$1,000,000 capital, and office at St. John, N.B., is reported to be negotiating in Great Britain, for the purchase of two fast steamships, equipped with large cold storage facilities, for service between the Maritime Provinces and the West Indies.

The Gulf Transport Line s.s. Inkula, running between Liverpool, Eng., and Galveston, Texas, is to be transferred, to the Canadian Mexican Pacific Co.'s service, operating between Vancouver and Salina Cruz, in connection with the Tehuantepec Ry. Both the companies named are controlled by Welsford and Co., Liverpool, Eng.

Sir Donald Mann, Vice President, Canadian Northern Ry., is reported to have said, while in California, recently, that the company would shortly inaugurate a steamship service between Canada, Australia and Oriental ports, in addition to a grain service from the Pacific coast, by way of Vancouver and the Panama Canal. Large vessels, suitable for the grain trade would be built for the service.

Following on the withdrawal of the Weir Line of steamships from the Pacific trade, reported to have been the result of an agreement with the Union Steamship Co. of New Zealand, F. Waterhouse and Co., formerly agents for the Weir Line, have chartered the steamships Belle of Scotland, Strathendrick, Strathairly and Henrik Ibsen for the Australian service, with Vancouver as a port of call.

E. J. M. Nash, representing the Royal Mail Steam Packet Co., visited Vancouver and other coast ports recently to study the possibilities for new trade routes which may be opened up on the completion of the Panama canal. The recent merger of steamship interests in Great Britain places this company at the head of 280 steamships aggregating 1,287,950 tons. The companies merged are the Royal Mail Steam Packet Co., Pacific Mail Steamship Co., Elder Dempster Co., Lamport and Holt and the Union Castle Line.

Sir Wm. Mackenzie, President, Canadian Northern Ry., is reported to have stated in London, Eng., Jan. 4, that the rumored proposal of the U.S. Govern-

ment to grant a preference to U.S. vessels passing through the Panama Canal, would be resented by Canada, though he was afraid Canada had not looked far enough ahead. Canadians were naturally expecting a further substantial development of their far eastern trade on the opening of the canal, and they desired perfect freedom of navigation to and from their Pacific ports.

D. B. Hanna, Second Vice President, Canadian Northern Steamships, Ltd., who returned to Toronto Jan. 20 from Great Britain, is reported to have stated that one of his objects in going there was to secure additional steamships for the company's service for the forthcoming season, but so far he had been unsuccessful. He endeavored first to purchase suitable vessels, and then to charter them. Negotiations are proceeding for the charter of one vessel. He also said that all accommodation on the Royal George and Royal Edward had been booked up to April.

Furness Withy and Co.'s s.s. Hochelaga, presumably for operation in the Canadian service, was launched at Middlesbrough, Eng., recently. She is of the latest improved type of patent cantilever construction with top side water ballast tanks, built to the highest class of the British Corporation, with a deadweight capacity of about 7,600 tons on a light draught. She will have four holds, all free from obstruction, and will be self-trimming owing to the sloping sides of the top side tanks at each side of the vessel. She will be equipped with triple expansion engines with cylinders 26, 44 and 73 ins. diam., by 48 ins. stroke.

Maritime Province and Newfoundland.

The Dominion Government steamboat Lady Laurier, which struck a shoal in Barrington passage, N.S., Jan. 17, was released Jan. 21 and taken to Halifax for repairs.

The Reid Newfoundland Co. has increased its dry dock and ship repairing facilities at St. John's, Nfld., by the purchase of the Angel Engineering Supply Co.'s marine works.

The Reid Newfoundland Co.'s s.s. Bruce was expected to sail from the Clyde, Scotland, Jan. 20, for St. John's, Nfld. On her arrival she will be run between Port aux Basques, Nfld., and North Sydney, N.S.

The St. John River Dredging and Construction Co. is applying for incorporation, with \$50,000 capital, and office at Fredericton, N.B., to own and operate dredges and vessels of all kinds, and to conduct a general dredging business in the province.

The Island Tug Co.'s annual meeting was held at Charlottetown, P.E.I., Jan. 9, when a dividend of 10% was declared for the past year. The following directors were elected:—J. L. McMillan, H. W. Longworth and S. W. Crabbe, replacing F. W. Hynd, F. R. Heartz and T. B. Riley.

With reference to the recent reports that the contract for the proposed works at Courtenay Bay, St. John, had been awarded, and that work would be immediately started, we are officially advised, Jan. 3, that the contract for the harbor improvements there had not then been placed.

C. W. Morse, who was sentenced to 15 years imprisonment some time ago at New York for fraud, and who was connected with the Eastern Steamship Co., operating between St. John, N.B., and Boston, Mass., has been released and the remainder of the sentence commuted on account of ill health.

The Maritime Dredging and Construction Co., Ltd., has been incorporated under the Dominion Companies Act, with \$750,000 capital, and office at St. John, N.B., to own and operate dredging and construction plants, and to carry on a general construction business, except the construction of railways, telegraph lines, etc.

Job Bros. and Co., St. John's Nfld., have had built at Rotterdam an auxiliary ship, named Netherthorn. She is fitted with steel lower masts and bowsprit with gaffs and topmasts of pitch pine. The fore, main and mizzen sails were made in St. John's and shipped to Europe. She is equipped with all the modern appliances for rapid handling of cargo.

At a meeting of the St. Stephen, N.B., board of trade recently, the claims of Oak Point harbor were discussed, and it was agreed that a pamphlet describing them be prepared and sent to all members of Parliament. It is claimed that the natural advantages are greater than in any other harbor on the Atlantic, and that the expenditure of about \$2,000,000 would provide all the necessary additional accommodation for large ocean going vessels.

The Eastern Steamship Co., which has operated a line of steamships between St. John and Boston, Mass., for some years has been incorporated with the Metropolitan Steamship Co. and the Maine Steamship Co., under the name of the Eastern Steamship Corporation. The International line, between St. John and Boston direct, and between St. John and Boston, via Lubec, Eastport and Portland, will be operated as the eastern division, and for the purpose of general recognition, the old names will be retained.

Bowring and Co., St. John's, Nfld., and Liverpool, Eng., are having built at Newcastle, Eng., an oil tank steamship to Lloyds 100A1 class on the Isherwood system, three deck rule, with 10 oil compartments and four cofferdams, two pump rooms, and with all necessary equipment for carrying and burning liquid fuel. She will be 420 ft. long, 54½ ft. beam, 32¾ ft. deep, with capacity of 9,300 tons deadweight on 26 ft. draught. She will be equipped with triple expansion engines with cylinders 27 ins., 45 ins., and 75 ins. diam. by 48 ins. stroke, for a speed of 11 knots an hour.

The Renwick Co.'s s.s. Renwick was sunk in collision with the s.s. St. Pierre Miquelon, off Country Harbor, at the end of December. She was owned by the Renwick Co., Toronto, and operated by the Inverness Ry. and Coal Co., and was built at Willington Quay, Eng., in 1890, her dimensions being, length 180 ft., breadth 28.1 ft., depth 13.7 ft.; tonnage, 664 gross, 402 register, and was equipped with engine of 70 n.h.p., driving a screw, and is on the British Register. The s.s. St. Pierre Miquelon was seized at North Sydney, Jan. 2, on a claim of \$45,000 made by the Renwick's owners.

The s.s. Turret Bell was offered for sale recently, at Quebec, by order of the Exchequer Court. She was built at Sunderland, Eng., in 1894, and is of the following dimensions,—length 297 ft., breadth 40 ft., depth 21 ft. 7 in.; tonnage, 2,211 register. She is equipped with triple expansion engines with cylinders 22½, 36½ and 60 ins. diam. by 42 ins. stroke, 233 n.h.p., supplied with steam by two Scotch boilers, and has a dead weight capacity of 3,500 tons on a 20 ft. draught. She is registered at Newcastle, Eng., and was sold with all

equipment, etc., in the condition as she lay at Indian Cove, near St. Joseph de Levis, Que.

Province of Quebec Marine.

Hugh A. Allan, Chairman, Allan Line, has sent \$500 towards clearing off the debt on the Sailors' Institute at Montreal.

The Quebec Waterways Commission held its first meeting of the year at Quebec, Jan. 3. S. N. Parent, formerly Chairman, National Transcontinental Railway Commission, is Chairman.

The Levis Ferries, Ltd. steamboat Colomb, while running into her wharf at Quebec, Jan. 11, collided with the Quebec and Levis Ferry Co.'s steamboat Queen, causing considerable damage.

The Montreal Harbor Commissioners, accompanied by the harbor officials and a number of guests, made a trip down stream, Jan. 1, on the tug Sir Hugh Allan. This is the first time such a trip has been undertaken on Jan. 1, since 1878.

The Dominion Government steamboat Montcalm left Quebec, Jan. 17, for the annual trip to Seven Islands with passengers and supplies. On her return she will be engaged with the steamboat Lady Grey on ice work in the Cap Rouge channel.

The Montreal Harbor Commissioners have laid before the Minister of Marine plans for an expenditure of \$2,000,000 during the forthcoming season. The work proposed covers the completion of the dry dock, new sheds, dredging of the channel and new piers.

The Department of Marine will receive tenders to Feb. 26, for the construction of one or two steel single screw bucket dredges, a steel single screw hopper dredge, one set of compound steam engines, to develop 450 i.h.p. for dredge 37, and fifty steel rock digging buckets with links and pins, all delivered at Sorel.

A meeting of mayors of municipalities on the south shore of the St. Lawrence was held at Levis, Jan. 4, when it was resolved to point out to the Government, that in the event of re-forming the Quebec harbor commission on the same lines as that of Montreal, the south shore municipalities should be represented.

The Richelieu and Ontario Navigation Co., which operates the ferry service from Montreal to Longueuil and Boucherville, ran a special trip on Jan. 1. The regular service closed Dec. 29, finishing the longest navigation season for several years. In 1899, the season was closed on Dec. 30, and in 1881, on Jan. 1, the latter constituting a record.

The Montreal Harbor Commissioners met the city board of control, Jan. 10, to adjust differences regarding the taxation of the commissioners' property. The mayor stated that the right of the municipality to tax the property would have to be settled by the courts, and when this was done, the city would secure such legislation as would enable it to exercise its right without militating against those of the port.

The bill to amend the Quebec Harbor Commissioners Act, recently introduced into the House of Commons by the Minister of Marine, provides for the repeal of secs. 7 to 16 inclusive, and the insertion of new sections to the effect that the commission shall consist of three members appointed by the Governor in Council on the advice of the Minister of Marine, and that they hold office during pleasure; two members shall form a quorum; one of the members may be appointed as president, and each member may be paid out of the harbor revenue, such remuneration as may be determined by the Governor in Council.

Ontario and the Great Lakes.

Capt. R. Walton, a well known Great Lakes mariner, died at St. Catharines, Jan. 10.

Capt. C. McDiarmid, a well known lake tug captain, died at Windsor, Jan. 9, aged 55.

Capt. Thos. Horne, for many years a master mariner on the Great Lakes, died in Stamford tp., Jan. 18, aged 86.

The Black Rock Lock at Buffalo, N.Y., which was completed on Dec. 18, is 600 ft. long, 70 ft. wide, 24 ft. deep, and has a lift of 5 ft. There are five pairs of gates.

A survey party is again working on a route for the proposed new Welland canal, from the mouth of Ten Mile Creek, and commenced boring operations at Thorold, early in January.

What is stated to be a record in late navigation on Lake Ontario, took place, Dec. 27, when the sloop Ariadne loaded grain at Kingston and sailed for Stone Mills on the Bay of Quinte.

R. Read, who commanded various schooners on Lake Ontario, in the old sailing days, and who was engaged since 1896 as master of lock 2, Welland canal, died at St. Catharines, Jan. 2.

During 1911 there were 2,574 vessel passages through the Welland canal, the highest number in its history. The fastest trip was made by the steamboat City of Montreal, which took 9 hrs. 20 mins.

The Rainy River Navigation Co. is reported to have entered suit against the Minnesota and Ontario Power Co. for damage suffered owing to the lowering of the water in the lower part of the river.

The Victoria Navigation Co., Ltd., incorporated under the Dominion Companies Act, has been licensed to carry on business in Ontario, utilizing a capital of \$50,000 in the province, with J. H. Hall, Ottawa, as its attorney.

It is reported that a floating dry dock will shortly be built at Port Stanley, with proper facilities for repairing all vessels coming to the port. O. C. Smith is stated to be interested in the project, together with the Tug Owners' Association.

The Montreal, Ottawa and Georgian Bay Canal Co. is applying to Parliament for an extension of time, to May 1, 1914, for the commencement of construction and for the expenditure of \$50,000 on such work, and to May 1, 1920, for the completion of the canals.

The steamboat John Sharples, which ran aground in lower Lake Ontario in the winter of 1910-11, and was subsequently abandoned to the underwriters, was sold recently to the Reid Wrecking Co., Sarnia. She is now at Port Huron, Mich., where she will be repaired.

The Northern Michigan Transportation Co., of Chicago, Ill., is arranging for the operation of its steamboat Missouri, via Mackinac, to Collingwood, calling at intermediate ports, next season. The Goodrich Steamship Co., Chicago, Ill., will also, probably put its steamboat Arizona on the same route.

The Toronto Harbor Commission held its inaugural meeting, Jan. 4, when the transfer of the Ashbridge Bay property from the city was formally made. E. L. Cousins, who has been in charge of the city of Toronto's bridge and railway work for some time, has been appointed Engineer for the Commission.

The Pelee Sand and Gravel Co. recently organized in Cleveland, Ohio, is reported to have contracted for a steamboat to ply between Point Pelee, Lake Erie and south shore points. It is said the boat will be built at Cleveland, and that she will cost \$80,000, and will be equipped with a self-unloading device,

electric generating plant and other modern machinery. The contract calls for delivery early in May.

The Great Waterways Union of Canada has been formed at Berlin, Ont., to inaugurate a campaign to hasten with all possible speed, the development by the Dominion Government of an ocean waterway to the head of the lakes, by way of the St. Lawrence river and the Welland canal, and to urge the Government not to proceed with the proposed Georgian Bay project, without having first conducted the most complete investigation as to its feasibility.

A. St. Laurent, Assistant Deputy Minister of Public Works, accompanied by C. R. Coullee, Assistant Engineer of the work in connection with the proposed Georgian Bay canal, are visiting the Panama canal works with the view of obtaining information which may be of use in connection with the Georgian Bay operations. Their return is expected in February, when a report will be prepared for submission to the Department.

The U.S. Lake Survey reports the levels of the Great Lakes, in feet above tidewater, for December, 1911, as follows,—Superior, 601.88; Michigan and Huron, 579.46; Erie, 571.46; Ontario, 244.63. As compared with the average December levels for the past ten years, Superior was 0.56 ft. below; Michigan and Huron, 0.77 ft. below; Erie, 0.2 ft. below, and Ontario, 0.74 ft. below. It was anticipated that during January, Superior would fall 0.3 ft.; Michigan and Huron, 0.1 ft., and that Erie and Ontario would remain stationary.

The proposal to establish a dry dock at Owen Sound, which was submitted to the local council about two years ago, and for which the taxpayers had voted a subsidy of \$50,000, was again introduced, Jan. 20, in amended form. The new proposal covers a much larger scheme than was at first contemplated, involving an expenditure of about \$1,500,000. The plans will be considered by the town council, and it is proposed to ask the town to take \$50,000 of stock and grant an annual bonus of \$10,000 for 20 years.

Jas. Playfair, President, Inland Lines, Ltd., is reported to have stated recently that the Northern Navigation Co.'s steamboat Huronic would not be lengthened during this winter, as at first intended, as it would not be possible to have her ready for the spring service. Some repair work would, however, be undertaken, chiefly to her keel. He also stated that tenders would be invited shortly for the construction of another vessel as soon as the plans were decided on. The new vessel would be the flag ship of the fleet.

A bill which was recently introduced into the House of Commons, providing for the incorporation of the Hamilton Harbor Commission, defines the port and harbor of Hamilton as including Burlington Bay and Cootes Paradise, with all the inlets, dock and other water front property, water lots, piers, shores and beaches along the bay. It is desired that the commission shall consist of three members, two being appointed by the Governor in Council and one by the city on the nomination of the board of control. The appointment to be for three years, each being eligible for re-appointment; two members shall form a quorum, and the members shall elect their own chairman and appoint all officers.

An Ottawa dispatch of Jan. 22 says: "The Government engineers have completed the surveys of the Welland canal and their report with recommendations will be submitted to the Government very shortly. It is believed that the Government is favorably inclined to the proposition to rebuild the canal, and it is rumored that there will be an appropriation to start work in the supple-

mentary estimates. Four routes have been suggested by the engineers. One is from Nioyin Point to Jordan, which would mean an entirely new project. The second is a division of the present canal from Welland to 15-mile creek on Lake Ontario. The third diverts the canal from a point south of Thorold to Port Dalhousie, while the fourth proposed division would end at Ten Mile Creek."

The Dominion Government has decided to abandon the work on the Newmarket canal, which was intended to form a water route between Newmarket and Lake Simcoe, by way of the Holland river. The work was commenced in 1908, on an original estimate of \$328,000, and in March, 1911, a final estimate of \$1,000,000 was submitted to Parliament, and a statement that \$459,832 had been spent to Mar. 31. The work was divided into two sections, section 1 being from Cook's Bay, Lake Simcoe, to Holland Landing, on the east branch of the Holland river, and section 2 extending from that point to Newmarket, 4½ miles. The rise from start to finish was 43 ft., which was overcome by three locks. Lock and dam no. 3 are finished and about 60% of lock and dam no. 2, the excavation for lock no. 1 being partly done, as is also the dock at Newmarket. When completed, some time in 1913, it was intended that the work should form part of the Trent Valley canal system, connecting Lake Simcoe and the Georgian Bay, which latter work, it is reported, is also to be abandoned.

Manitoba, Saskatchewan and Alberta.

It is reported that efforts are being made to get the Government to erect wireless telegraph stations on Lake Winnipeg, for the benefit of navigation, and to extend the telephone system from Icelandic River to the north end of Big Island.

The U.S. Congress is being asked to order a new survey of the Red River, from Fargo, N.D., to the Canadian boundary, with the view of creating a 12 ft. channel, and the ultimate establishment of a through waterway from Fargo to Hudson Bay. It is stated that a navigable waterway can be made by the construction of two, or more, dams, and that with the improvements contemplated by the Dominion Government, a feasible route can be made, by way of the Nelson River and the northern outlet of Lake Winnipeg.

British Columbia and Pacific Coast Marine.

The C.P.R. s.s. Princess Adelaide was taken out of service, Jan. 2, and sent to Seattle, Wash., where oil-burning apparatus was installed.

The C.P.R. s.s. Amur has been sold to the Coastwise Barge Co., Seattle, Wash., to carry ore from Howe Sound, B.C., to Tacoma, Wash.

The North Vancouver ferry steamboats are to be converted into oil burners. It is estimated that this will save about \$8,000 a year.

The C.P.R. s.s. Princess Beatrice, which ran aground on Noble Island, Nov. 14, 1911, has been repaired, and again placed in service on the Queen Charlotte Islands run.

Representations from the Yukon territory are being made to the Dominion Government on the question of securing a seaport. It is suggested that negotiations be opened with the United States, with a view to securing a port on the Lynn canal, either by purchase or exchange.

The Canadian Fish and Cold Storage Co., Ltd., recently incorporated with

\$1,500,000 capital and office at Prince Rupert, is inviting tenders in England for building 16 halibut fishing steamers for use in northern waters this year. A cold storage plant is being erected at Prince Rupert.

C. D. Swan, Government engineer, appointed to report on the proposed harbor improvement scheme at Vancouver, has completed his general inspection, and has left for Europe, where he will inspect various harbors with a view to adopting the latest improvements in a scheme which he will submit in a report on his return.

The C.P.R. s.s. Princess Sophia, which has been built at Paisley, Scotland, is reported to be practically ready for dispatch to the Pacific coast, and she is expected to sail from the Clyde early in February. She is 245 ft. long, 44 ft. beam and 18 ft. deep, and is equipped with triple expansion engines, with boilers and furnaces fitted for either coal or oil fuel.

The turbine s.s. Queen Alexandra, which the C.P.R. recently purchased in Glasgow, Scotland, for its Vancouver, Nanaimo and Comox service, and which was illustrated in our last issue, has been thoroughly overhauled, repaired and altered to make it suitable for its new service, and has been re-named Princess Patricia, after the daughter of H.R.H. the Governor General. The vessel sailed from the Clyde, Jan. 5, for Vancouver, by way of Cape Horn.

With reference to the steamboat which the British Columbia Express Co. is building for operation between Tete Jaune Cache and Fort George, of which mention was made in our last issue, we are advised that it will be 118 ft. long by 24½ ft. beam, arranged for large power on a light draught. The estimated cost is \$50,000. She will run as fast mail, passenger and freight steamboat, and will extend the company's system, so that connections can be made between Ashcroft on the C.P.R. and Tete Jaune Cache, the head of navigation on the Fraser River.

The Shipowners' Association of British Columbia is taking up the question of improving the accommodation of, and approaches to False Creek, Vancouver, including the deepening of the channel, the construction of a Government wharf east of the Granville St. bridge, and a protest against the proposed filling in of a large area there, and the use of the Government dredge Mastodon, in doing any dredging work in connection with the Vancouver, Victoria and Eastern Ry. and Navigation Co.'s improvements, prior to the completion of all dredging work which has been outlined for the general benefit of the port.

The Union Steamship of British Columbia has awarded a contract for extensions to its Vancouver dock, to O'Brien, McCaughey and Lemcke, Seattle, Wash. An office is to be opened by the contractors in Vancouver, and the contract provides for the employment of Vancouver labor and the purchase locally of all material with the exception of creosoted piling. The contract for the shore end improvements has been let to Ironsides, Rannie and Campbell, and that for the office building to J. McNee, Vancouver. Plans for additional extensions to the dock will be further considered in the spring, when J. H. Welsford, President, is due from England for a general inspection of the company's properties.

The C.P.R. s.s. Princess Alice, which arrived at Victoria, recently, was built in England. Her machinery consists of triple expansion engines, with cylinders 27, 42, and 48½ ins. diam, by 39 ins. stroke, supplied with steam by four Scotch boilers, 15.7 ft. outside diameter, by 12 ft. long, with three Morison furnaces, 49 ins. diam. There is a total

grate area of 330 sq. ft., and a heating surface of 10,900 sq. ft. The engines are of 4,390 i.h.p., and are equipped with oil burning apparatus. On her recent trials on a boiler pressure of about 180 lbs. per sq. in., an average of 155 revs. per minute was attained, with an average horse power, for four hours, of 4,280, on a mean draught of 14 ft. 2 ins., making close to 18 knots an hour in a heavy swell.

It is announced that, following the recent visit of C. E. E. Ussher, Passenger Traffic Manager, C.P.R., to the Pacific coast, the C.P.R. will, on May 1, inaugurate a steamship service between Victoria and Tacoma, Wash., leaving Victoria daily at 9 a.m. and Tacoma at 8 p.m. It is stated that the service will be more of an experimental nature, to see if there is sufficient passenger traffic available to justify the service, and if so, it will become permanent.

Twohy Bros., Ashcroft, B.C., who have a contract for the construction of a portion of the Canadian Northern Pacific Ry., are having built at Kamloops a stern wheel steamboat to run on the North Thompson River, for about 100 miles north of Kamloops, or as far as it will permit of navigation. She will be 140 ft. long, 34 ft. beam and about 30 ins. draught, equipped with engine having cylinder 15 ins. diam. by 72 ins. stroke, of 600 h.p. She will be used chiefly for carrying supplies, but will also operate in the passenger trade.

Coasting Regulations for Foreign Vessels

The regulations permitting foreign vessels to carry on a coasting trade in Canada were contained in an order in council of Dec. 17, 1908, and amended, Dec. 28, 1908, being published in our issues of Jan. and Feb., 1909. A further order in council has been made, as follows:—

Steamships of not less than 1,500 tons gross tonnage, each, of the following countries, Italy, Germany, the Netherlands, Sweden, Norway, Austro-Hungary, Denmark, Belgium, the Argentine Republic and Japan, shall be admitted to the coasting trade of Canada in the carrying of goods and passengers coastwise between any port in the province of Nova Scotia and any port in the province of Quebec, and vice versa, on the same terms and conditions as are applicable to Canadian vessels, until Dec. 31, 1913.

Muskoka Lakes Navigation and Hotel Co.—At the annual meeting in Toronto recently a number of changes were made in the board, J. S. Playfair, who has been President for several years, retiring. The directors for the current year, all of whom live in Toronto, are:—President, H. C. MacLean; Vice Presidents, G. T. Somers and W. W. George; other directors, R. S. Wilson, F. F. Brintnell, and A. McLean Macdonnell, K.C. The Manager and Treasurer is W. F. Wasley, and the Manager of the Royal Muskoka Hotel is L. W. Maxson.

D. H. Bowen, who has been appointed Assistant Superintendent, C.P.R. Telegraphs, Ontario Division, Toronto, was presented with \$500 by local business men on his leaving London, Ont., where he had been local manager for the company.

The Board of Railway Commissioners has passed the following order 15559, to which reference was made in our last issue:—"The application of express companies operating in Canada and subject to the Board's jurisdiction, for approval of their standard tariffs, and the Board's judgment of Dec. 24, 1910. It is ordered that the time allowed for the said judgment for the free return of empty packages carried full by the express companies prior to Mar. 1, 1911, be extended to Nov. 1, 1912."

St. Lawrence & Chicago Steam Navigation Co.'s Annual Meeting.

Following are extracts from the report for the year 1911, presented at the annual meeting in Toronto, Jan. 10:—

The season of 1911 was not generally a very profitable one to vessel interests. A large number of freight steamships usually employed on the lakes were laid up on account of inability to secure profitable cargoes. Your steamships, however, have been kept regularly employed, although at low rates, but the increased rates prevailing in November gave a fair profit, making the season's business on the whole fairly satisfactory, and the prospect of increased business in 1912 gives some encouragement for the future.

Acting on the authority granted at the last annual meeting, your directors insured a proportion of the risk on the steamships under a modified form of policy at a reduced rate, and as our steamships had no accidents, nor required docking during the season, we have saved a large sum, which, added to our insurance fund, makes the total at credit of that fund now \$53,802.30, and it is the intention of your directors to continue the same policy, unless insurance rates are reduced to a reasonable basis.

The directors from the earnings of the season have paid a dividend of 5%, and, after providing for same, have carried forward \$5,433.63 to the credit of profit and loss, making a balance at credit of that account of \$141,476.72.

ASSETS.

Five steamships, viz.: Algonquin, Iroquois, W. D. Matthews, G. R. Crowe, E. B. Osler	\$1,000,000.00
Freights and accounts receivable ..	17,786.22
Balance in bank	37,584.80

\$1,055,371.02

LIABILITIES.

Capital stock	\$ 860,000.00
Accounts payable	92.00
Insurance fund	53,802.30
Balance of profit and loss carried forward	141,476.72

\$1,055,371.02

PROFIT AND LOSS ACCOUNT.

Balance brought forward, Jan. 3, 1911	\$136,042.89
Steamships' earnings	\$62,210.74
Interest	456.85

62,667.59

Cost of management, viz.: salaries, taxes, office rent, directors and auditors' fees, etc.	\$ 14,233.76
Dividend 5%, payable Jan. 2, 1912.	43,000.00
Balance carried forward	141,476.72

\$198,710.48

The directors, who were re-elected for the current year, are:—President, W. D. Matthews; Vice President and Secretary, J. H. G. Hagarty; Managing Director, A. A. Wright; other directors, Jas. Carruthers, Capt. S. Crangle, G. R. Crowe, C. S. Gzowski, Sir Edmund Osler.

Vessels Removed from the Register.

The following vessels were removed from the Canadian register during December, 1911, for the reasons assigned:—Steam—Athens, Victoria, B.C., 8 tons, stranded; Bonanza, Vancouver, B.C., 74 tons, sunk; Circassian, Ottawa, 5 tons, out of existence; Clipper, Ottawa, 3 tons, out of existence; D. W. Gordon, Victoria, B.C., 6 tons, burnt; Eva, Montreal, 4 tons, burnt; Eva, Port Hope, Ont., 12 tons, burnt; Eva Belle, Collingwood, Ont., 7 tons, burnt 15 years as Evangeline, Montreal, 16 tons, burnt; Elswood, Kingston, Ont., 17 tons, out of existence; Fern, Vancouver, B.C., 17 tons, burnt; Governor Morton, Port Stanley, Ont., 10 tons, burnt; Grenada, Prescott, Ont., 43 tons, broken up; Harvey Neelon, St. Catharines, Ont., 47 tons,

burnt; Helen, Goderich, Ont., 3 tons, out of existence; Help, Liverpool, N.S., 78 tons, stranded; Ida, Quebec, 9 tons, broken up; Irene, Ottawa, 2 tons, out of existence; Iroquois, Victoria, B.C., 94 tons, foundered; Janet Craig, Ottawa, 6 tons, out of existence; John McDonald, Ottawa, 16 tons, out of existence; Juno, Ottawa, 8 tons, broken up; Kate, Sault Ste. Marie, Ont., 30 tons, burnt; Kate Marks, Sault Ste. Marie, Ont., 43 tons, abandoned as worthless in 1900; Lady Dufferin, Chatham, N.B., 29 tons, broken up; Little Jem, Port Dover, Ont., 2 tons, out of existence; Lizzie, Ottawa, 1 ton, out of existence; Lothair, Port Hope, Ont., 281 tons, out of existence; Marina, Yarmouth, N.S., 16 tons, stranded; North America, Charlottetown, P.E.I., 99 tons, wrecked; Petrel, Winnipeg, 94 tons, wrecked; Plover, Montreal, 27 tons, broken up; R-Tis-3, Charlottetown, P.E.I., condemned; Wasaga, Collingwood, Ont., 1108 tons, burnt. Sailing—A. Gauthier, Ottawa 137 tons, out of existence; Colborne, Montreal, 302 tons, broken up; Ethel Aggie, Charlottetown, P.E.I., 48 tons, wrecked; Germaine, Montreal, 87 tons, broken up; Hattie Muriel, St. John, N.B., 85 tons, wrecked; Jubilee, Charlottetown, P.E.I., 76 tons, sold to foreigners; Julie Plant, Lunenburg, N.S., 62 tons, broken up; Loyal, Lunenburg, N.S., 99 tons, stranded; Marconi, Liverpool, N.S., 199 tons, abandoned at sea; Margaret S., Lunenburg, N.S., 63 tons, transferred to Newfoundland; Marguerite, Yarmouth, N.S., 57 tons, broken up; Maria, Chatham, N.B., 28 tons, lost; Muriel, Lunenburg, N.S., 110 tons, stranded; Nahada, Lunenburg, N.S., 94 tons, transferred to Newfoundland; Naiad, Sarnia, Ont., 276 tons, abandoned; R. W. Smith, Lunenburg, N.S., 74 tons, broken up; Reliance, Shelburne, N.S., 192 tons, wrecked; Renown, Lunenburg, N.S., 79 tons, lost at sea; St. Patrick, Halifax, N.S., 27 tons, wrecked; Scud, St. John, N.B., 56 tons, broken up; Sweet Marie, Charlottetown, P.E.I., 77 tons, wrecked.

TENDERS.

SEPARATE TENDERS addressed to the undersigned, at Ottawa, and endorsed on the envelope either "Tender for Bucket Dredgers," "Tender for Hooper Barge," "Tender for Compound Engines," or "Tender for Dredge Buckets, etc.," will be received up to noon of the Twenty-sixth day of February, 1912, for the following:—1. The construction of one or two Steel Single Screw Bucket Dredgers, to be delivered at Sorel. 2. The construction of a Steel Single Screw Hooper Barge, to be delivered at Sorel. 3. The construction of one set of Compound Steam Engines to develop 450 indicated horse-power for dredge No. 37, to be delivered at Sorel. 4. The furnishing of fifty Steel Rock Digging Buckets, Cast Steel Links and Manganese Bucket Pins, to be delivered at Sorel. Tenders may be submitted for one or all of the four items, but in any case a separate tender must be submitted for each item indicated above.

Full information and specifications in connection with the above can be procured on application from the Purchasing and Contract Agent, Department of Marine and Fisheries, Ottawa. There are no special tender forms in connection with this work. Each tender must be accompanied by an accepted bank cheque in favor of the Deputy Minister of Marine and Fisheries equal to ten per cent. (10 p.c.) of the value of the item or items tendered on, which cheque will be forfeited if the successful tenderer declines to enter into a contract with the Department or fails to complete the work contracted for in accordance with the contract to be prepared by the Department. Cheques accompanying unsuccessful tenders will be returned. The Department does not bind itself to accept the lowest or any tender. Newspapers inserting this advertisement without authority will not be paid for same.

ALEXANDER JOHNSTON,

Deputy Minister of Marine and Fisheries.

Among the Express Companies.

R. Paton McLea, of Montreal, has been elected Vice President, Dominion Ex. Co., to succeed the late C. F. Smith.

The Board of Railway Commissioners has fixed the collection and delivery limits for express companies in Brighton, Ont., and Strathcona, Alta.

The Canadian Northern Ex. Co. has opened an office at Fork River, Man., and has closed its offices at Bellevue, Man., and Carlsberg, Sask.

C. Powers, a Canadian Ex. Co. driver and messenger at Winnipeg, was arrested recently on a charge of theft of \$10,000. He claims that he was made intoxicated by two men and robbed.

The charges against J. D. Chilman and J. Acheson, of robbing the Canadian Ex. Co.'s office at Hamilton, Ont., of about \$8,000, were heard Jan. 14. The latter was acquitted, and the former found guilty of receiving part of the proceeds, and sentenced to one year's imprisonment.

The Board of Railway Commissioners on Jan. 10, ordered the Canadian Ex. Co. to file, before Jan. 25, a tariff abolishing the extra charge between Picton, N.S., and Charlottetown, P.E.I., except when it may be necessary, owing to weather conditions, for traffic to be carried to Georgetown, P.E.I.

The Canadian Ex. Co., Jan. 15, commenced operating over the Temiskaming and Northern Ontario Ry., between North Bay and Cochrane, and has opened offices, with regular agents, at Cobalt, Charlton, Cochrane, Dane, Diver, Earlton, Englehart, Gillies Depot, Hailbury, Heaslip, Iroquois Falls, Latchford, Matheson, Mulock, New Liskeard, North Cobalt, Porcupine, South Porcupine, Swastika, Thornton, Tomiko, Timagami, Uno Park, and Widdifield. Arrangements have also been made to handle traffic for Elk Lake, via stage from Charlton, in the winter, and by boat and stage from Latchford in the summer.

The Dominion Ex. Co., in connection with the recent order of the Board of Railway Commissioners as to the free return of empty packages, quoted on another page, has issued instructions to its agents, pointing out that empties which have been forwarded full over the company's system, and entitled to free return under the classification effective prior to Mar. 1, 1911, and outstanding at that date, may be returned free until Nov. 1, 1912, provided that each shipper entitled to free return of such empties, files with the company a statement showing the dates the full packages were shipped, to what points, the names of the persons, and the number of packages, which must be verified by the agent from his books.

Telegraph and Cable Matters.

The C.P.R. has erected a duplicate wire between Merritt and Vancouver, B.C.

The Canadian Northern Telegraph Co. has closed its office at Carlsberg, Sask.

E. Rawlings, director, Montreal Telegraph Co., died in Montreal, recently, aged 72.

The Board of Railway Commissioners commenced its enquiry into the question of telegraph tolls, at Ottawa, Jan. 8.

J. A. Wisely, heretofore chief operator, has been appointed local manager, C.P.R. Telegraphs, Halifax, N.S., vice W. M. Godsoe, promoted.

L. H. McNamara, publisher of the Bruce Herald, has been appointed agent, Great North Western Telegraph Co., Walkerton, Ont., succeeding his father, M. McNamara, deceased.

C. W. MacDonald, heretofore assistant night chief operator, C.P.R. Telegraphs, Toronto, has been appointed local manager at London, Ont., vice D. H. Bowen, appointed Assistant Superintendent, Ontario Division, Toronto.

D. H. Bowen, heretofore local manager, C.P.R. Telegraphs, London, Ont., has been appointed Assistant Superintendent, Ontario Division, Office, Toronto. He entered the C.P.R. Telegraph service Oct. 1, 1886, as agent at St. Thomas, Ont., and was appointed local manager at London, Ont., Apr. 23, 1890.

J. F. Richardson, whose appointment as Superintendent, C.P.R. Telegraphs, British Columbia Division, Vancouver, was announced in our last issue, was presented with a purse of gold, by the staffs at Montreal, Ottawa and Quebec, on his transfer from the position of Superintendent, Eastern Division, Montreal.

The Pacific Cable Board's new cable, which is to be laid between Australia and New Zealand, will cost about \$875,000, which will be taken from the Board's reserve fund. The cable will be laid between Sydney and Auckland, and it is stated that the Board's headquarters in New Zealand will be moved to Auckland with the view of giving a speedier service.

W. M. Godsoe, who has been appointed Superintendent, Atlantic Division, C.P.R. Telegraphs, St. John, N.B., was born there, and entered the service there in May, 1895, being transferred to Halifax, N.S., in May, 1896. He was subsequently appointed chief operator there, and in May, 1902, Manager. On leaving Halifax, recently, to take up his new position, he was presented by the staff and personal friends, with a gold chain and engraved locket, and fitted travelling suit case.

The Maritime Telegraph and Telephone Co., which recently absorbed the Nova Scotia Telephone Co., has completely reorganized its staff, and contemplates making a number of improvements in the service. The present officers and directors are: President, S. M. Brookfield; Vice President, O. E. Smith; directors, M. Dwyer, H. R. Silver, Hon. B. F. Pearson, R. E. Harris, J. R. McLeod, Halifax, N.S., and C. F. Sise, Jr., and L. B. Macfarlane, Montreal. The annual meeting will be held in February.

The following changes of C.P.R. Telegraph officials in the Manitoba Division, J. McMillan, Superintendent, are reported:—W. R. Rutherford, heretofore local manager, Winnipeg, appointed supervisor at Souris; W. D. Neil, heretofore chief clerk to Superintendent, Alberta Division, Calgary, appointed local manager, Winnipeg, vice W. R. Rutherford; W. Kennedy, heretofore agent at Regina, Sask., appointed assistant city representative, Winnipeg; W. K. Thompson, heretofore agent at Saskatoon, Sask., appointed chief operator, Winnipeg, vice W. J. Kane; W. J. Kane, heretofore chief operator, appointed supervisor, Winnipeg.

The following changes of C.P.R. telegraph officials are announced, in addition to those mentioned in our last issue:—W. J. Camp, heretofore Electrical Engineer, has been appointed Assistant Manager, Office, Montreal. J. Fletcher, heretofore Superintendent, British Columbia Division, Vancouver, has been appointed Superintendent of Traffic, Office, Montreal. W. M. Godsoe, heretofore local manager, Halifax, N.S., has been appointed Superintendent, Atlantic Division, vice F. J. Mahon, transferred to Montreal, Office, St. John, N.B. D. H. Bowen, heretofore local manager, London, Ont., has been appointed Assistant Superintendent, Ontario Division, Office, Toronto.

The Montreal Telegraph Co.'s report,

which was presented at the annual meeting in Montreal, Jan. 11, shows assets of \$2,293,724.72. The capital is \$2,000,000, and the excess in value of property operated by the Great North Western Telegraph Co. over shareholders' capital is \$151,823.85; dividend paid Jan. 15, \$40,000; unclaimed dividends, \$938.76, and contingent fund, \$100,962.11. The system is operated by the G.N.W. Telegraph Co., and its operation and maintenance are guaranteed by the Western Union Telegraph Co., for 97 years from July 1, 1881. The total distribution to shareholders during 1911, comprising dividends and bonuses, was \$165,000. B. McLennan and R. MacD. Paterson were elected directors, succeeding H. A. Allan, resigned, and E. Rawlings, deceased.

In giving evidence before the Board of Railway Commissioners, Jan. 11, in the enquiry into telegraph tolls generally, W. J. Camp, Assistant Manager, C.P.R. Telegraphs, is reported to have stated that the total cost of the company's telegraph system, exclusive of freight charges on the material from point of origin to destinations, was \$6,696,421.40, of which \$3,897,238 was for pole line equipment. This was spread over 12,108 miles of poles, making the average cost per mile, \$321.87. The cost of wires was given as \$2,190,988, and cables \$275,044, the balance being for batteries, instruments, etc. It was also stated that there were 75,782 miles of wire along the right of way, 49,936 miles of this being exclusively commercial, 5,201 exclusively railway, and 20,735 joint railway and commercial. Of the total, 21¾% was given as railway line and 78¼% as commercial, and on that basis it was estimated that \$1,204,267.81 value of the plant was devoted to railway use exclusively, and \$5,492,153 to commercial use. The whole telegraph system of the company is estimated to be worth \$6,156,168.

The Safety Car Heating and Lighting Co., New York and Montreal, has been advised by Julius Pintsch Aktiengesellschaft, Berlin, that the Prussian Minister of Public Works Von Breitenbach, has denied a report, published in various European journals, that by action of the Reichstag at Berlin, the Prussian State Railways were to be equipped with electric light. This denial by the Minister over his signature refutes any contemplated change from gas to electricity as an illuminant on the Prussian State Railways.

NOTICE is hereby given that an application will be made by the Toronto Suburban Railway Company to the Legislature of the Province of Ontario at its next session for an Act authorizing the company:

(a) To extend its line from some point at or near Guelph, in the County of Wellington, to some point at or near Berlin, Preston, Hespeler and Galt, in the County of Waterloo, and thence to a point at or near Hamilton, in the County of Wentworth, passing through or near the Townships of Guelph, Waterloo, Dumfries, Puslinch, Beverley, Flamboro West, and Ancaster.

(b) To amend Section One of the Statutes of 1910 by inserting after the words "County of Peel," in the fourth line thereof the words "or from some point on its authorized Hamilton line at or near Cooksville, in the County of Peel."

(c) To increase the capital stock, to authorize the issue of bonds or debenture stock for terminals, bridges, station-houses, electrical generating plants and the appurtenances thereto, and all other electrical equipment necessary for the purposes of the company.

(d) To extend the time for the commencement and completion of the company's railways and for other purposes.

Dated at Toronto, this 27th day of December, 1911.

ROYCE & HENDERSON,
Traders Bank Building, Toronto.
Solicitors for the Toronto Suburban Railway Company.

TRADE AND SUPPLY NOTES.

The matter which appears under this heading is compiled, in most cases, from information supplied by the manufacturers of, or dealers in, the articles referred to, and in publishing the same we accept no responsibility. At the same time we wish our readers to distinctly understand that we are not paid for the publication of any of this matter, and that we will not consider any proposition to insert reading matter in our columns for pay or its equivalent. Advertising contracts will not be taken with any condition that accepting them will oblige us to publish reading notices. In other words, our reading columns are not for sale, either to advertisers or others.

Calendars for 1912 have been received from Dearborn Drug and Chemical Works, Chicago; Mussels, Ltd., F. H. Hopkins and Co., Montreal; Baldwin Locomotive Works, Philadelphia.

Kennedy and MacDonald, Edmondston, N.B., who have a contract on the National Transcontinental Ry., are having three locomotives completely overhauled by the Robb Engineering Co., Amherst, N.S.

The Steel Co. of Canada has let contracts for two new open hearth furnaces of 50 tons capacity each, a blooming mill, a continuous billet mill, and a combination rod and bar mill to be built at Hamilton, Ont.

The Robb Engineering Co., Amherst, N.S., has received an order to install in a factory being built by Moirs, Limited, at Halifax, N.S., a 200 h.p. Robb-Mumford internally fired boiler, to be operated at 150 lbs. working pressure, and a 150 k.w. generator driven by a Robb-Armstrong automatic Corliss engine of the side crank type.

J. J. Gartshore, 58 Front St. West, Toronto, has purchased the material on the Opeongo Logging Railway at Whitney, Ont., in consequence of the line being taken up, as the Ontario Government has purchased some of the timber limits in that district and is adding the territory to Algonquin Park. There were a little over 13 miles of track and the rails are in first-class condition for relaying.

Allis-Chalmers-Bullock, Limited, Montreal, is an entirely separate and distinct corporation and is not in any way affected by the receivership proceedings in connection with the United States company. It has not felt adverse conditions similar to those in the U.S.; but, on the contrary, the shops are full of work and running regular time. The proceedings will not affect the operations of the Canadian company in any way.

The Canadian Locomotive Co.'s shareholders held a special meeting at Kingston, Ont., Jan. 3, when the President, W. Harty, between whom and the other directors some friction had arisen, resigned, and A. W. Wheatley, heretofore General Manager, was elected a director to succeed him. The board as now constituted is as follows:—Emilius Jarvis, Toronto, President; A. W. Wheatley, Kingston, Vice President, and General Manager; R. Hobson, Hamilton, Ont., W. Y. Soper, Ottawa, F. G. Wallace, Pittsborough, Pa., J. L. Whiting, Kingston, Jas. Redmond, Montreal.

The Goldschmidt Thermit Co. in its publication, *Reactions*, among a number of illustrated descriptions of thermit welding, gives one of the welding of a locomotive frame at the C.P.R. shops, Revelstoke, B.C. The size of the frame at the point of fracture was 19½ by 3½ ins. The frame had to be taken off the locomotive, so that the weld was made after it had been taken down. There were altogether three breaks, two of which were welded with the frame down, and the third after the frame had been replaced in the locomotive. Altogether 300 lbs. of thermit was used, with the usual percentage of punchings and manganese.

TENDERS FOR THE SUPPLY OF TRACK INTERSECTIONS AND OTHER SPECIAL WORK LAYOUTS.

Separate or bulk tenders on prescribed forms will be received by registered post only, addressed to the Chairman of the Board of Control, City Hall, Toronto, Canada, up to noon on Tuesday, February 20th, 1912, for the supply of track intersections and other special work layouts.

Specifications and forms of tender may be obtained on application to the Department of Railways and Bridges, City Engineer's Office, Toronto.

Envelopes containing tenders must be plainly marked "Tender for Track Intersections and Other Special Work Layouts."

The tenderers shall submit, with their tenders, the names of two sureties (approved of by the City Treasurer, not members of the City Council or officers of the Corporation of the City of Toronto), or in lieu of said sureties, the bond of a guarantee company approved of as aforesaid.

The lowest or any tender not necessarily accepted.

G. R. GEARY (Mayor),

Chairman of the Board of Control,
City Hall,
Toronto, January 22nd, 1912.

MANITOBA AND NORTHWESTERN RAILWAY COMPANY.

NOTICE is hereby given that the Manitoba and Northwestern Railway Company of Canada will apply to the Parliament of Canada, at its present session, for an Act authorizing it to increase its bonding powers, and for other purposes.

Dated at Montreal this 12th January, 1912.

H. C. OSWALD,
Secretary.

The delegates attending the International Marine Association's conference at Philadelphia, Pa., in July, will, on the close of the conference, be the guests of the Dominion Government for a tour of the Great Lakes and St. Lawrence, visiting Fort William, Owen Sound, Toronto, Kingston and Montreal.

Keep Your Engine Oil The Bowser Way

There are thousands and thousands of dollars lost every year through the waste of oils in engine-rooms just because an adequate means for storing it has not been provided.

This all-steel cabinet is especially designed for handling oils in power departments. It is fire-proof and prevents dust and dirt from reaching the oils. The metal roll top locks.

The Bowser Oil Storage Systems

cover every phase of oil storage and distribution. For a small cost you can make a saving in your oil department that will more than cover the investment.

Proper oil storage not only conserves the oil, but it eliminates all dust and dirt which saves much wear and tear on the machinery.

Every engine-room needs a Bowser and should have it. Ask for Book No. 18.

S. F. Bowser & Co., Inc., 66-68 FRASER AVENUE **Toronto, Ont.**

Our Improved Reinforced BRAKESHOES

RAILWAY BRAKESHOE

Are suitable for all classes of Electric and Steam Railways and Street Cars. They are fitted with an improved attaching lug which can be made of any desired thickness to suit the class of service, and requires no re-inforcing for retaining it in position and cannot be detached from the Steel Back.

They have an even co-efficient of friction throughout their whole life and a greater percentage of this shoe can be worn out than any other make of shoe on the market.

We stock all standard Brakeshoes suitable for Christy heads, etc.

We contract on a guaranteed saving on your present aggregate cost.

Let us submit you further particulars.

Patents applied for in all countries.

THE LESSON

taught by this widespread use of Pay-As-You-Enter Cars is obvious. Increased Revenue, Accident Elimination and Schedule Improvement have been demonstrated in every case. Isn't all this sufficient to show that it always pays to operate the Pay-As-You-Enter Car? Why not remodel some of your present cars?

We license manufacturers and railways to build and use the Pay-As-You-Enter Car, the Patents on which are owned by

THE PAY-AS-YOU-ENTER CAR CORPORATION,

78 CRAIG STREET WEST, MONTREAL

BOOTH WATER SOFTENERS

What You Should Know

- (1) Boiler Maintenance—
One \$10,000 softener
saved \$250 per month—
30 per cent. on investment.
- (2) Saving in Fuel—
One \$1,500 softener
saved \$4,888 yearly in
coal—over 300 per cent.
on investment. Another
softener reduced fuel con-
sumption 20 per cent.
- (3) Washing Out Boilers—
Stationary boilers washed
out once in 168 days; be-
fore using softener, once
in 7 days.
- (4) Cost of Purifying Water
The average cost is from
one to three cents per
1,000 gallons, depending
on hardness of water.

We have data on softeners in
operation to prove these and
other conclusive statements.

Ferranti

TRACTION METERS

The demand for Car Meters has grown very rapidly and the economies effected by the installation of these instruments have more than justified their use.

The guaranteed accuracy of the Ferranti Traction Meter is $2\frac{1}{2}$ per cent. from full load to 1-10th load.

Will stand 100 per cent. overload for ten minutes.

Interesting data and attractive prices furnished on application to

Canadian Representative

O-B Trolley Wheels

V Groove

O-B Six-inch Wheel

U Groove

The Wheel that will give you the longest service and yet not wear the trolley wire excessively must be made from a real bronze metal that is very expensive.

These desirable characteristics are secured in O-B Wheels by using a carefully determined mixture of pure ingot metals and uniformity of results is insured by the laboratory analysis of each heat of metal used in their manufacture.

Made in 4, 5 and 6-inch sizes for $\frac{1}{2}$, $\frac{3}{8}$ and $\frac{1}{4}$ -inch axles.

A service trial will tell you more
than pages of descriptive matter.

The Ohio Brass Co., Mansfield, Ohio

Steel Castings

One of the two largest steel castings ever made in Canada was cast by us. They were Y-pipe connections for a 10,500 H.P. water wheel. We made it for the John McDougall Caledonian Iron Works, and they were thoroughly satisfied.

EDISON BSCO PRIMARY BATTERY

the standard battery for Railway Signal Service

Constant and even the most recent development of the Edison BSCO Primary Battery, increasing the effective capacity and giving higher working voltage, by no means renders the former types of Edison BSCO obsolete—as compared with other railway signal batteries. For the former Edison BSCO is quite as far in advance of other batteries as the *present* Edison BSCO is in advance of its earlier model.

Every railway signal engineer and purchasing agent should have the complete information regarding Edison BSCO Primary Batteries which we have ready to send. Write for this information to-day.

Iron and Steel of Astonishing Durability

One important thing about Titanium Alloy is that it enormously increases the durability of every kind of steel and practically every grade of iron. It does this at a cost so low as to be almost insignificant compared with results.

TITANIUM

The Wonder-Working Alloy

does its good work when added to iron in the cupola; to steel as it flows into the ladle. The fact that it also increases strength, and resistance to rust and corrosion makes its value almost inestimable.

You can get some valuable facts
from Booklet No. 30. Send for it.

TITANIUM ALLOY MANUFACTURING CO.

Kalamazoo Reinforced Pressed Steel Wheels

For Hand and Push Cars

They always wear much longer than others, giving fully 100 per cent. greater service than any other wheel of similar design or weight.

Kalamazoo Wheels are strongest where other wheels are weakest—in the throat of the flange (See sectional cut).

Made in three sizes, 16 in., 20 in., 24 in.

Twenty Styles of Kalamazoo Velocipedes

The Kalamazoo idea is to provide the proper velocipede for each different need. No difference what you want or for what purpose, we have it

We also build Hand Cars, Push Cars, Inspection Cars, and Gasolene Motor Cars, in many styles and sizes.

YOU Need This Railroad Library

—a library that will give you the best up-to-date modern practice. There is no other reference

work in the world that so completely meets the needs of the railroad man as the INTERNATIONAL RAILROAD LIBRARY. This is an epitome of the years of experience of the best railroad experts in the country edited in a style that 18 years of experience in publishing home-study textbooks has proved the easiest to learn, to remember, and to apply. The volumes of this library are a part of a series of textbooks that cost \$1,500,000 to prepare. They are recommended by the highest authorities and are used in nearly all our leading universities and colleges. Not only can they be used to great advantage by superintendents, railroad officials, foremen, engineers, firemen, conductors, and brakemen as an authoritative guide in their work, but since they can be so clearly understood even by persons having no knowledge of higher mathematics, they can be used by all classes of railroad employees that are desirous of advancing to higher positions. Write for catalog now.

INTERNATIONAL TEXTBOOK COMPANY

N.Y. CITY, U.S.A.

The Bradstreet Company gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

Correspondence Invited.

Detroit Lubricators for every Locomotive

Write for catalog
L-81 and full in-
formation.

DETROIT LUBRICATOR COMPANY.

DETROIT, U. S. A.

Detroit Bullseye Locomotive Lubricators are used on all kinds of locomotives in every kind of service.

They are made with two, three, four, five, six and seven feeds for simple, compound, Mallet compound, superheater Mallet compound, Shay—all kinds of locomotives—with special provision for controlling the lubrication of one or more air pumps, mechanical stoker and intercepting valve.

The new Detroit Bullseye locomotive lubricator with oil control valve will give every part of any locomotive efficient, dependable and economical lubrication.

Canadian Agents
Taylor & Arnold, Ltd.
404 St. James St.,
Montreal.

Locomotive Packings

Throttle Sets

Air Pump Sets

No jerking of throttles and jolting of trains where Anchor Throttle Packing is used as it allows the Throttle Spindle to work with ease.

"BROWNHOIST" LOCOMOTIVE CRANES

"Brownhoist" Crane Coaling Engine on N. Y., N. H. & H. R. R. from cars on side track.

A RAPID AND ECONOMICAL METHOD of handling coal from car to engine or from car to coal tipple. The crane coals the engine while it is being cleaned on the ashpit. It cleans the pit, placing the ashes into the car. Many roads use the crane to fill the pockets on their coal chutes. Time and money are saved on both of these methods of coaling an engine.

ON CONSTRUCTION WORK the crane is a labor saver. The crane excavates, drives piling with a pile-driver, handles construction material of all kinds, switches the cars, places heavy steel structures, and does all the lifting and moving of material.

AROUND THE SHOP AND YARD the crane handles ALL material. It can be equipped with either grab bucket, bottom block, or lifting magnet. Either one is easily and quickly applied.

"Brownhoist" Cranes are built for hard and continuous service.

Catalogs and Full Information sent on request.

Westinghouse CROSS-COMPOUND Air Compressors

By compounding both the steam used and the air compressed, a capacity **THREE TIMES GREATER** than that of the $9\frac{1}{2}$ pump is secured, with the same steam consumption.

The saving in steam consumption is not the only economy effected. The cross-compound pump also saves time in getting trains out of the yard and provides ample volume and pressure for proper brake operation on the road, due to prompt charging of the brake system, particularly insuring normal release, thus preventing "dragging" of brake shoes and sliding of wheels; it reduces cost of compressor maintenance, and gives an ample reserve for operating auxiliary apparatus such as water scoops, track-sanders, bellringers, engine reversing mechanism, Pullman water raising system, and the like.

New Air Brake Compressor

The new type AA-7 Compressor for Air Brake Equipments now offered to Electric Railway Companies is designed to reduce, to a minimum, the necessity of repairs.

In comparative tests these new AA-7 Compressors show remarkably high efficiency.

For full particulars of construction, send for new bulletin 1525.

USE

Galena Railway Safety Oil "B"

in Marker and Classification Lamps, to secure Efficiency of Service, Maximum Candle Power, Clearness of Light.

Galena Long Time Burner Oil

for use in Switch and Semaphore Lamps, and all lamps for long time burning, to avoid smoked and cracked chimneys and crusted wicks.

Tests and correspondence solicited.

S. A. MEGEATH,

PRESIDENT

FAIRBANKS-MORSE

Combined Engine and Pump

Our Water Station Equipment will reduce your expenses, such as attendance, maintenance and fuel cost to a minimum. A great advantage in this system, whether for railroads water station or for town waterworks, is the little attendance necessary. A section foreman or a station agent can look over the engine and start it before taking up his other duties.

We contract for complete erection of these tanks and the furnishing of pumping machinery.

THE HEINE SAFETY BOILER

Don't keep on using a boiler if it is running your engine room into unnecessary expense by allowing the heat to go to waste.

The "Heine" Safety Boiler is not only constructed so as to best absorb the heat, but also that the heat may best reach it.

It is the most economical in use of fuel, as it delivers the greatest quantity of dry steam for each pound of fuel burned in the furnace.

The "Heine" is guaranteed to be absolutely safe, as it is thoroughly tested under high pressure before leaving our works.

The "Heine" Mud Drum is constantly at work keeping the boiler free from all mud and scale-forming matter.

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	-	-	-	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	-	-	-	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	-	-	-	9.40 p.m.	Daily.
Leave North Toronto	-	-	-	10.00 p.m.	Will Stop at Westmount.

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ¶ The roadbed has been improved till it is unexcelled in Canada.
- ¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

MODERN DESIGNS FOR MOTOR CONNECTION

The Only Satisfactory Test of a File is Actual Use

Mechanics are particular and will continue to use a make of file they have found to give the best results. The Nicholson File Company adopted and adhered to the policy of making the best file possible.

The result of this policy is that their business has increased from 100 dozen a day sold in a local market in 1864 to 16,000 dozen a day sold all over the world, and Nicholson-made Files are recognized as the standard wherever files are used.

Keep Your Engine Oil The Bowser Way

There are thousands and thousands of dollars lost every year through the waste of oils in engine-rooms just because an adequate means for storing it has not been provided.

This all-steel cabinet is especially designed for handling oils in power departments. It is fire-proof and prevents dust and dirt from reaching the oils. The metal roll top locks.

The Bowser Oil Storage Systems

cover every phase of oil storage and distribution. For a small cost you can make a saving in your oil department that will more than cover the investment.

Proper oil storage not only conserves the oil, but it eliminates all dust and dirt which saves much wear and tear on the machinery.

Every engine-room needs a Bowser and should have it. Ask for Book No. 18.

"YOU HAVE SAVED OUR LIVES DURING THIS COLD SNAP. I DON'T KNOW HOW WE WOULD HAVE GOTTEN ALONG WITHOUT THE COMPOUND."

So stated the superintendent of a prominent railroad, a few days ago, to the Dearborn representative who called to see if the best results were being secured from the use of DEARBORN TREATMENT on the line.

This is the sentiment that prevails on the many railroads using Dearborn.

Dearborn Treatment is of invaluable service in the prevention of foaming and otherwise improving the water conditions, during the periods of extreme cold weather, when the natural water supplies are at their worst, and other difficulties of operation greatly increased.

We can give prompt attention to your needs.

Canadian Pacific Railway Mallet 0-6-6-0 Locomotives.

By Frederick H. Moody, B.A.Sc.

In common with the latest developments in motive power additions on United States railways, the C.P.R. has, during the past three or four years, been experimenting with Mallet locomotives for pusher service on the mountain sections of the British Columbia Division, where gradients up to 2.45 and 15-degree curves are to be negotiated. For this service Mallet locomotives are particularly adapted. The locomotives at present working on these gradients are consolidation, with 21 by 28-in. cylinders and 58-in. driving wheels, with a total weight of 185,000 lbs., 168,000 lbs. of which is on the driving wheels. These locomotives, under normal summer conditions, are capable of handling trains up to 424 tons on the accepted rating, and it is to assist such locomotives over the heavy gradients that experimental work on Mallet locomotives has been performed, leading up to the present locomotives herein referred to.

During 1909 an experimental Mallet locomotive was built by the C.P.R., to

recently been finally completed, consists of 4 compounds, 1951-4, and one simple 1955, all of the same general design. The general appearance of the compound Mallets of the series is shown in the accompanying illustration, fig. 1, while fig. 2 outlines the locomotive construction more in detail.

The following table gives the principal dimensions:

Type	0-6-6-0
Gauge	4 ft. 8½ ins.
Service	Pusher
Fuel	Bituminous coal
Tractive power	57,000 lbs.
Weight, drivers	259,000 lbs.
Weight, total	259,000 lbs.
Wheel base, front engine	10 ft. 4 ins.
Wheel base, rear engine	10 ft. 4 ins.
Wheel base, total, engine	35 ft. 2 ins.
Wheel base, engine and tender	60 ft. 7 ins.
Weight on drivers÷tractive effort	4.54
Tract. effort×dia. drivers÷equiv. heat. surf. ..	921
Equiv. heat. surf.÷grate area	62
Weight on drivers÷equiv. heat. surf.	72
Cylinders, h.p.	23 x 26 ins.
Cylinders, l.p.	34 x 26 ins.
Cylinders (simple engine 1955 only) ..	20 x 26 ins.
Valves, h.p.	11 in. Piston

of leading and trailing wheels, placing all the weight on drivers and shortening the wheel base. The usual arrangement is to place the low pressure cylinders at the forward end of the front engine, demanding more flexible and extension joints in the steam pipe lines. The angular movement of the exhaust pipe itself, from low pressure cylinder to exhaust pipe in smoke-box, is very materially reduced by this new arrangement, as may readily be understood, from the fact that the low pressure cylinder, being near the point of swing with regard to the rear engine frame, has but little side motion. The arrangement used will be explained more fully at a later point.

THE BOILER used in this series of locomotives has been changed very materially from that used in the original experimental Mallet. In the latter, the boiler, which was of the wagon-top radially stayed type, had the barrel divided into three sections. The rear section comprised the boiler proper, extending

Fig. 1.—Canadian Pacific Railway Mallet 0-6-6-0 Locomotive.

its own designs, a description of which was given in The Railway and Marine World of Aug., 1909. This locomotive contained many features that were decidedly unique in Mallet construction. Following considerable experimental work and investigation on operating performances, a number of changes were embodied in the design. This remodelled locomotive was described in detail by G. I. Evans, Mechanical Engineer, C.P.R., in The Railway and Marine World of April, 1910. That article also contained an outline and data of test runs made on the gradients near the Angus shops. Following this experimental stage the locomotive was put into service on the B.C. Division under the conditions for which it was designed. Here a very elaborate series of tests under actual operating conditions was performed, the graphical results of which were embodied in an article in The Railway and Marine World for Jan. of this year.

All this experimental work gave the C.P.R. mechanical department a great deal of data upon which to base the design of a further series of five Mallets, a description of which is embodied herewith. This new series which has only

Valves, l.p.	12 in. Piston
Driving wheels, dia.	58 ins.
Driving axles, main, 9½x12 ins.; others 9x12 ins.	
Boiler	Radial stayed, wagon top
Pressure	200 lbs.
Firebox, size	120 x 69½ ins.
Firebox, sheets	5-16, ¾, 1-12 and 7-16 ins.
Firebox, water spaces, sides, 4½ ins.; throat, 5 ins.; back, 3½ ins.	
Tubes, 154 2¼-in. dia.; 16 2-in. dia.; and 22 5¼-in. dia.	
Tubes, length between sheets	20 ft. 1½ ins.
Heating surface, tubes	2,589 sq. ft.
Heating surface, firebox	180 sq. ft.
Heating surface total	2,769 sq. ft.
Superheating surface	548 sq. ft.
Equiv. heat. surf. (=total heat. surf.+super. surf.×1.5)	3,591 sq. ft.
Grate area	58 sq. ft.
Tender tank, kind	Semi-water bottom
Tender frame sills	Centre, 13 ins.; sides 10 ins.
Tender trucks, kind	Equalizer
Tender wheels, diar.	34 ins.
Tender axles	5½ x 10 ins.
Water capacity	5,000 imp. gals.
Coal	12 tons

A cursory inspection of both figs. 1 and 2 will show that the construction of these Mallet locomotives is decidedly different from the practice followed by U.S. roads that have added Mallets to their rolling stock. Principal among these points of difference are the arrangement of cylinders and the absence

about two-fifths the length of the barrel. In front of this there was a compartment containing the superheater tubes, which projected downward from steam headers into the path of the flue gases. From this compartment the flue gases passed on into a further plain tube section, constituting a feed-water heater. The feed water, warmed in this compartment, passed on to the rear section, was there converted into steam and passed out into the superheater tubes, and thence to the high pressure cylinders through outside pipes passing down each side from the steam dome. In this newer design, a plain wagon-top, radially-stayed boiler is used, this design being found preferable to the three-compartment type used experimentally.

The tube sheets, 20 ft. 1½ ins. apart, provide for flues of a normal length, in contradistinction to some recent U.S. designs, where tube lengths up to 24 ft. are to be found. It is in every sense a plain barrel boiler of the extended wagon-top type, with the possible exception that the corners of the firebox, both inside and outside, are greater than usual to increase the boiler rigidity, as lack of the latter is believed to be re-

Fig. 2—Elevation of Canadian Pacific Railway Mallet 0-6-6-0 Locomotive.

sponsible for staybolt breakage in the end rows.

The feed-water heater and superheater chamber being eliminated, a superheater of the Vaughan-Horsey type is placed in the smoke-box, the arrangement of headers, etc., being noted in the elevation drawing, fig. 2. The injector check valve is located on the top centre line of the boiler, under the bell stand, and has three connections—one for the left and another for the right hand injectors, and a third for connection with pipe or hose coupling for use in filling or blowing off the boiler.

Instead of placing both sand boxes on top of the boiler as in the former design, one of them is located in the upper forward part of the smoke-box, feeders leading down on the inside of the smoke-box shell. The box is filled through a small door on the top.

The experimental locomotive had a double petticoat smoke stack. In the new design this has been eliminated and a single wide-flare stack introduced in its place.

FRAME, CONNECTIONS AND SPRING RIGGING.—The frames for each engine are one-piece steel castings, slabbed for the cylinder fit, and also for the front bumper and back foot-plate. The sections of both top and bottom rails of the frames are $4\frac{1}{2}$ ins. wide by $4\frac{1}{2}$ ins. deep and $4\frac{1}{2}$ ins. wide by 3 ins. deep respectively.

The only feature of particular import-

ance about the frames lies in the manner of connection between the front and rear engines. In the experimental locomotive a plain pin connection at the point of juncture of the two connecting castings served as the means of connection. This pin was in triple shear when pulling, but was relieved of all strain when pushing, by the design of the connecting castings being such as to have corresponding contact faces, taking up all thrust independently of the pin.

The new method of frame connection is clearly shown in fig. 3, a plan view of the immediate vicinity of the connection. Essentially, the connection is similar to that between engine and tender, a built-up plate drawbar, 9 ft. 8 ins. long, as shown in the illustration, being used. This connecting drawbar is pin-connected at the rear end of the cross-bracing castings between the cylinders. The faces of the castings, where they come in close proximity to each other at the inner ends, have a curved surface, with a radius to the centre of the drawbar pin. A concave casting with similar curved surfaces acts as a filler, permitting a rolling motion between the front and rear engines when rounding curves. That is to say, the intervening piece so adjusts itself as the engine takes a curve that its centre is always in a line joining the two drawbar centres. This arrangement maintains a close alignment between front and rear sections, eliminating all play.

The drawbar was so designed as regards length that as the adjacent ends of the frames move outward when taking a curve, the centre of the drawbar is always in the centre line of movement, i.e., directly over the centre of the track, keeping the push or pull where desired, and overcoming the difficulties that would be experienced from side thrusts were the connections as in the original design.

Centring rods, to maintain the relative location of front and rear engines with regard to each other, are attached, one on each side of the connecting casting of the rear engine, these being attached by pins at the centre to the connecting casting of the front engine, as shown in fig. 3. The relative positions being thus maintained, the intervening distance casting has no tendency to jam in place.

When pulling, the front part of the forward engine of a Mallet has a tendency to lift, this condition being reversed when the engine is pushing. In this new design this undesirable feature is taken care of by means of bolts carrying compression springs passing down from lugs on the upper surface of the connecting casting of the back truck to similar lugs on the lower surface of the connecting casting of the front truck as indicated both in fig. 3, and at the point of connection in fig. 2. Thus, the connecting casting of the rear frame, through its bolts, carries the rear end of

the forward frame when the front of the latter tends to rise, with a consequent depression of the rear end. The springs, mounted on the carrying bolts, absorb any quick fluctuations that may occur.

The spring rigging is of the usual type, equalized from front to rear on each truck. The forward engine has a cross equalizer at the front, but the rear engine is merely equalized along the sides.

CYLINDERS AND MOTION WORK.—Both pairs of cylinders are of the piston valve type, with inside admission on the high, and outside on the low pressure engines. They are decidedly unique, forming a radical departure from the practice heretofore followed in Canada. The low pressure cylinder, being typical of both, is shown in fig. 4.

The point of particular change lies in the fact that the cylinders are made of cast steel, lined with cast-iron bushings. Making them of steel saves a weight of no less than 6,000 lbs., which is a very important factor where weight elimination to obtain greater steaming capacity is desired. An examination will show how extremely light in construction the cylinder is, the shell being only $\frac{5}{8}$ in. in thickness, with a corresponding high pressure thickness.

The cylinders are cast separately, divided at the centre line as usual. In the case of the high pressure cylinder, there is a cast-steel saddle common to

both cylinders and bolted to their top face, and to which the boiler is attached. The original low pressure had a small saddle bolted to the upper surface with a corresponding saddle attached to the boiler barrel, bearing upon it. In this design, this support has been dispensed with, for, on account of the movement

tuple-threaded nut. This is performed by a projection on the side of the handle near its point of suspension engaging another projection on the dog rod. Otherwise, the piston would not move by the air pressure, the dog engaged in the nut locking the piston in place.

The air moves the piston to the right.

by a set screw. To a pin in this moveable block the low pressure gear reach rod is attached. As shown in fig. 2, this reach rod, being too long for one piece, is made in three sections, with the middle section guided in bearings under the runboard near the centre of the locomotive.

PIPING.—A standard throttle valve located in the steam dome of the boiler supplies steam to a long dry pipe which runs forward to the front tube sheet. Here it connects to the saturated steam header and after traversing the superheater tubes to the superheated steam header branches out each side of the smoke-box, to a lagged pipe under each runboard, leading back to the high pressure cylinder.

The piping for carrying the exhaust from the header between the two high pressure cylinders to the low pressure cylinder header is quite ingenious. This piping is shown to the best advantage in fig. 3, which, in conjunction with fig. 2, clearly outlines the arrangement. The idea was to pipe the steam from the high pressure engine to some point on the low pressure engine that had no motion relative to the latter. Such a point exists directly over the point of connection between the two connecting castings. This was absolutely the case in the old design where a pin connection was employed. By bringing the exhaust pipe to meet the intake pipe of the low pressure directly over the pin-connected point, there is no motion between the two other than a slight circular one, allowed for by a swivel joint. In this new design, however, as the locomotive takes

Fig. 3.—Connection between Front and Rear Engines.

possible at this point, pounding occurred, which could be attributed directly to the bearing surfaces knocking.

The Walschaert valve motion is used on both engines and is of the usual type to conform to C.P.R. standard practice with inside supported trunnioned bearings, dispensing with encompassing support. The front radius rod has a long suspension from the reach rod bell-crank, which combined with a ball and universal joint at the lower and upper ends respectively, allows the engine to take curves without much distortion to the valve motion. When rounding a sharp curve, the boiler will swing about 9 ins. off the centre line. This necessitates flexible joints. In addition, if the lifting link were short, it would swing over to a considerable angle when on this 9-in. offset, resulting in a lifting of the radius link from its normal position. This would shorten the valve travel when in forward gear, and lengthen it when in backward. The length of link here shown is sufficient to make this feature practically negligible.

Provision has been made for changing piston packing rings by simply removing the front cylinder heads, disconnecting the main rod from the cross-head and pushing the piston out into the space between the two cylinders. The piston valves have also been taken care of in a similar manner, so there can be no objection in this arrangement of cylinders on the score of inaccessibility.

An ingenious mechanical reverse mechanism, shown in fig. 5, has been designed for this engine. The operating mechanism consists of an 8-in. air cylinder, dampened in its movements by a 6-in. oil cylinder with an adjustable by-pass connecting the cylinder ends. The crosshead of the machine is attached to a fulcrumed lever, the upper end of which is connected by a short link to a rod, threaded for about two-thirds its length with a sextuple thread, $4\frac{1}{2}$ -in. pitch. This threaded rod is guided, attached to the top of the air and oil cylinders.

Confined in the casting above the opening between the air and oil cylinders there is a nut fitting the sextuple threaded rod. The outer surface of this nut is notched to receive a dog from above. This dog is moved automatically by the engineer when shifting the gear by the air valve above.

The operation is as follows: Swinging the handle of the 3-way valve to the right from the notch on the quadrant, lets air into the left end of the cylinder. The same movement of the 3-way handle raises the dog which engages the sex-

carrying forward the crosshead and lowering the links. The forward movement of the piston draws forward the sextuple-threaded rod, causing the nut to revolve in its retaining casting. When the gear has moved to the desired location, the 3-way valve handle is brought

Fig. 4—Low Pressure Cylinder made of Cast Steel.

back to its vertical position, which drops the dog back into the nut, locking the mechanism instantly in the desired location.

The mechanism is so designed as to make it possible to change the amount of motion of the low pressure gear, without disturbing that on the high pressure cylinder. The high pressure gear receives its motion directly from the fulcrumed lever moved by the air piston. On the same shaft as this fulcrumed lever there is keyed another lever, shown at the extreme right in fig. 5. This lever has a block adjustable a couple of inches

a curve, the new drawbar arrangement causes these central joints on both frames, to part as they swing outward due to the engine negotiating the curve. That is to say, the actual centre line of the locomotive lengthens—a case of two sides of a triangle being greater than the third.

The method of making these steam connections is as follows: The steam pipe, rigidly connected to the header of the high-pressure cylinder, is bent into a large loop as in fig. 3, the section of the pipe itself being first flattened into an oval section as indicated in fig. 2. the

pipe thus assuming the shape of the tube of a Bourdon gauge. The other end is connected by a swivel joint to the low pressure header. Now, as the locomotive takes a curve, this central point of the swivel joint becomes further away from the corresponding point in the high pressure frame, by a fraction of an inch, causing the distance between the pipe connection centres to slightly increase. A solid pipe connection would likely break under such a strain, but having this pipe not only flattened, but also bent to a large loop, it contains sufficient flexibility to spring the necessary amount.

From the low pressure header, the steam passes through the cylinders and out through another swivel joint to the exhaust pipe. This contains another feature peculiarly different from standard Mallet practice, though similar to that of the experimental locomotive. The small side swing of the exhaust outlet of the low pressure cylinders (less here even than in the experimental locomotive, on account of the outlet being on top less than 3 ft. from the point of swing), results in the elongation of this pipe being practically negligible. Thus the expansion joints in the usual design, capable of providing for extensions up to 1½ in. are not necessary. Instead, the extension is compensated for by the sliding of the pipe flanges on the flat

flange pressure is sufficiently low to safely warrant their absence.

In curving, it is the boiler body that offers the greatest resistance, and as the truck must swing laterally beneath it, it is supported partly by friction plates and partly by a spring suspended-roller. The arrangement of these suspending means is clearly shown in fig. 6. As indicated, there are two main castings, one mounted rigidly on the frames and the other bolted securely to the boiler body. One half the weight of the boiler is carried on plain, flat friction plates attached to the faces of the two main castings. There are four of these, in pairs, the intervening space being occupied by the floating device. The friction plates have ample surface, and are provided with oil grooves across the surfaces, which, con-

around a curve with the truck, may be varied at will by adjusting the compression of the spring by means of the supporting nuts.

The operation of the locomotives to date has been most satisfactory, the last of the series having been delivered some time ago. From observations made on experimental engine, it is expected that they will be able to handle trains up 700 tons alone.

Prevention of Locomotive Boiler Explosions.

For the prevention of boiler explosions due to low water, which is the commonest cause of such catastrophes, the Southern Pacific Lines have a

Fig. 6—Front Engine Bearing and Guiding Attachment.

faces of the ball rings. The flanges are held to their seats by 10 springs of 200 lbs. capacity each, or a total of 2,000 lbs. The exhaust from this point proceeds up the exhaust pipe.

GUIDING POWER OF FRONT ENGINE.—Guiding trucks have been dispensed with in this design of Mallet, it being believed that equally good guiding qualities may be obtained without their use. Their elimination reduces the wheel base and total weight, and the

Fig. 5—Power Reverse Mechanism.

connected with an oil box in the upper casting, ensures ample lubrication.

In the intervening space mentioned above, the floating device is located. Two wedge-shaped pieces, as indicated, are secured to the lower face of the upper casting, one on each side of the centre. These wedges have two different slopes, the steeper one being at the centre. A toothed roller engages with similar tooth cavities in the lower side of the wedge plates, this in turn being mounted on a floating shaft carried by two cross equalizers to springs supported on bolts from the lower casting. Any side movement of truck as when the locomotive is taking a curve, causes the inclined surfaces to force the roller downward against the resistance of the supporting springs, which produces a force to pull the boiler around the curve with the truck, and relieve the rear truck, to which the boiler is rigidly connected, from much of the strain, that would otherwise fall on the flanges of the leading pair of drivers of the back truck. The greater the side movement of the truck, the greater will be the reaction from the spring compression, resulting in a constantly increasing rolling resistance.

The frictional resistance of the flat friction plates decreases on taking curves, for, on account of the depression of the floating springs, a greater weight is carried by the latter part of the supporting mechanism, relieving the friction plates of a portion of their load, thereby decreasing the frictional resistance. The intensity of the assistance offered by the floating mechanism to the pulling of the front part of the boiler

low water alarm of their own design in use on a number of locomotives. This alarm consists of a small cast-iron chamber of mercury, integral with a surrounding chamber communicating at the bottom directly with the boiler at the level below which it is deemed inadvisable for the water level to drop. This space under normal conditions, fills with water from the boiler, this water cooling to much below boiler pressure, due to the unlagged surface of this cylinder. The inner mercury chamber communicates with a cylinder above, a packed piston in the latter resting on the mercury. The upper end of the piston bears on a steam valve. When the water in the boiler drops below the predetermined level, the water chamber empties, allowing live steam to enter, heating the inner chamber of mercury, which on expanding raises the piston, opening the steam valve. This steam valve communicates with a steam whistle, and in oil-burning engines with an oil-control lever, and in coal-burning a firebox sprinkler for dampening the fire.

The heaviest locomotives in service are the Mallet compounds of the 2-10-10-2 class on the Atchison, Topeka and Santa Fe Ry., which weigh 308 tons (without tender) and have 225 tons on the driving wheels. Each group of five driving axles has a wheelbase of 19 ft. 9 in. The heaviest ordinary locomotives are the 2-10-2 engines of the same road, which weigh 143 tons (without tender), with 117 tons on the driving wheels and a driving wheel-base of 19 ft. 9 in.

Railway Mechanical Methods and Devices.

Locomotive Netting Machine at G. T. R. Battle Creek Shops.

In the accompanying illustration a machine for the working of locomotive smoke-box netting at the Grand Trunk Ry. shops at Battle Creek, Mich., is shown. The customary method of cutting off sections for the locomotive netting is for three or more men to unroll the netting while another severs it along a marked line with a cold chisel. This is not only a slow operation, but also damaging to the fabric not only in the immediate neighborhood of the cutting, but also further back on the roll.

Machine for Shearing off Locomotive Smoke Box Netting.

In the device shown, the roll as it comes from the manufacturers is mounted on a drum supported on stands at the rear of the machine; these stands are integral with the base castings. The netting, taken off from the underside of the roll, passes between rollers to the front part of the machine. One of these rollers is provided with a ratchet arrangement as indicated, for the purpose of feeding the netting through. In the front of the machine it passes between two heavy steel cross bars, the lower one of which has an inset shearing knife edge on its upper forward edge.

The upper cross bar, which has a ratchet tooth surface on its upper face, carries the air-driven shearing apparatus. The front part of this apparatus is a three-layer structure down through which a shearing blade operates. This blade is actuated by a cam between the front and rear of these three plates, bearing down upon the upper face of the cutter. The spring in the front brings the cutter back after each stroke. Power is transmitted from the air motor to the pinion, and through the gear to the cam shaft.

Another cam on the cam shaft, shown just back of this three-layer body, actuates the feed mechanism. In its rotation it carries a sliding bar from side to side, a dog on one end engaging the ratchet surface, feeding across between cuts.

We are indebted for the above information to J. T. McGrath, Superintendent of Rolling Stock, Chicago and Alton Rd., who had the machine constructed when he was Master Mechanic of the G.T.R. Battle Creek shops.

Electric storage battery locomotives have been proposed by T. A. Edison for operating the Illinois Central Ry. suburban traffic at Chicago. Some experiments are to be made with his storage-battery motor cars, but single cars could not handle the traffic, and the suggestion was made to equip a train with a storage-battery tender to furnish the necessary power.

Reconstructing Postal Baggage Cars at Central Vermont Ry. Shops.

The United States Post Office Department's Railway Mail Service has laid down standard specifications covering the construction of postal cars. To meet the requirements called for, the Central Vermont Ry. is remodelling at its St. Albans, Vt., shops a number of old combination postal baggage cars. One of these, in process of conversion, is shown in the accompanying illustration.

These cars, 51 ft. long, of an all-wood body construction, were originally built with the usual short open vestibule. In

the reconstruction these vestibules are first of all cut off, and a new end structure built up, reinforced with steel. The end sill is composed of two pieces. The inner section, composed of a thoroughly

Re-constructing Postal Baggage Cars, Central Vermont Ry.

seasoned piece of white oak, $3\frac{1}{2}$ by $8\frac{1}{2}$ ins., is covered with a steel plate $\frac{3}{4}$ by 8 ins. the full width of the car as indicated. A similar plate $\frac{3}{4}$ by 7 ins., the full width of the car across the top in the location indicated, forms the upper reinforcing member.

Each side of the door opening, and bolted to the cross top and bolted plates on its flattened end, there is a piece of 60-lb. rail. The intervening space between this rail and the side of the car is filled with three $\frac{3}{4}$ by $3\frac{1}{2}$ in. rectangular bars between top and bottom, twisted at both ends to present the greatest strength for end impact. To these pieces the wooden studding is attached, on to which the sheathing is nailed.

The third member of the end sill is another piece of thoroughly seasoned white pine $4\frac{1}{2}$ by $8\frac{1}{2}$ ins. secured outside the metal cross strip. Built up over top of this is the diaphragm made up of

Boiler Tube Cleaner for Removing Scale and Rust by Tumbling.

7 by 9-in. oak, faced with 5 by $\frac{1}{2}$ -in. plate.

The centre sill of the car is reinforced by two strips of steel 8 by $\frac{1}{2}$ in. extending back 18 ft. from the end of the car, secured on each side of the sill. These changes added to the car make a very solid construction.

Boiler Tube Cleaner at the Pere Marquette Railroad Shops.

For cleaning the tubes that have been removed from the locomotive boiler for re-ending, the Pere Marquette Rd. in its shops at St. Thomas, Ont., has recently built a tumbling machine which, although extremely simple in construction, has proved very effective in performing this class of work.

As will be seen from the accompanying illustration, there are two cast end pieces, each with a trunnion for supporting the mechanism. The body of the tumbler consists of a number of channels set into cast recesses in the trunnioned ends, and to which they are bolted. The individual channels are kept a short distance apart by cast-iron separators through which pass the rivets holding the body in a solid unit.

The trunnioned end pieces have cast teeth in the periphery meshing, with a pinion on a long jackshaft, thereby driving both ends of the machine, putting no twisting strain in the body. A tight-and-loose pulley arrangement on this shaft delivers power by a belt from a drive-shaft inside the blacksmith shop, outside of which the machine is located.

For the introduction and removal of the tubes, one of the channels is hinged to the adjoining one, and locked to the other side. In service the tumbler is filled half full of tubes, and the mechanism set in motion for several hours. This operation completely removes the accumulated scale and rust, leaving the pipes clean for re-ending and trimming.

Mounting and Dismounting Steel Tires at the C. P. R. Angus Shops.

In the tender department of the C.P.R. Angus shops, Montreal, some ingenious methods have been devised for the rapid mounting and dismounting of steel tires from tender truck wheels, in a manner that is both economical and mechanically efficient.

Customarily, truck wheels when they come into the shop for new tires have the bolts that hold the retaining ring in place so badly burred up from various causes that it is usually necessary to cut them off with a chisel, they being generally considered of no further value except for scrap or else requiring so much work to reclaim as to make such a procedure unprofitable.

A method of removing the bolts in such a way as to reclaim them for further use has been devised in these shops, the tool employed being that shown in fig. 1. The old truck wheels, mounted on their axles, are brought into the shop on special tracks, which are

ground to the form of a square-faced flat drill as at C. Normally the bar B is held in the upper end of barrel A by a spring D. B is free to revolve in a right-hand direction in barrel A, but

a rack along the surface of the guiding ways, a handle attached to the former forcing the air motor into operation in the manner previously explained.

Following this bolt-removing opera-

Fig. 1—Tool for Removing Burr from Bruised and Damaged Bolts and Nuts, and Unscrewing.

it is prevented from revolving in a left-hand direction by spring pin E engaging in key way F. The nut socket end of barrel A is slipped on to the burred nut to be removed. The driving air motor is then operated in a right-hand direction, the cutter C being forced forward

tion, the wheels are pressed off the axles, and the tires taken off in the usual manner.

The next operation of interest is the mounting of new tires on the old centres. The method familiar to all is to heat the tire with an encircling gas or oil

Fig. 2—Method of Operating the Burr-removing Tool.

equipped at short intervals with stationary air jacks as indicated in fig. 2. Another of these air jacks is to be seen in the background. These air jacks are provided with cross arms, each carrying four small rollers, on which the truck wheel axle rests when jacked up to the position shown in fig. 2. The wheels in

against the end of the bolt and nut, removing the damaged surface. During this operation the barrel A is stationary. When a sufficient amount of burred surface is removed, the air motor is reversed, the key E causing the whole tool to turn in a left-hand direction, unscrewing the nut from its bolt. The heads

burning ring, and then drop the heat-expanded tire on to the centre piece to shrink in cooling. A new adaption of this method is here used, the heating apparatus for which is shown in fig. 3.

The tires to be heated—six at a time is the normal capacity of this heater—are placed in a pile on a brick base as

Fig. 3—Stand for Heating a Batch of Steel Tires.

Fig. 4—Steel Tires after Receiving their Steel Centres.

this location are in a convenient position to have the bolts worked upon. The apparatus for holding the burring and unscrewing tool is supported from a jib crane over the jacked up wheel. This will be explained later.

The burring and unscrewing tool, shown in fig. 1, consists essentially of a body A with nut socket lower end mounted on a tapered shank bar B, the lower end of which is hardened and

of both nut and bolt are thereby left in excellent condition for further use, instead of necessitating scraping as in the usual manner.

The method of applying this tool is shown in fig. 2. The air motor is supported in a carriage sliding in guides attached to the round horizontal bar shown. This bar is in turn suspended from a wall jib crane. A small pinion on the air motor carriage engages with

indicated in the illustration, fig. 3. An oil burner on the end of pipe line A impinges into the combustion chamber B, the necessary supply of air being obtained from the compressed air connection C. The combustion chamber is the enlarged end of the bent-neck casting, the heat of combustion being carried along and down into the pile of tires. The brick base, on which the tires are piled, is hollowed at the centre, so that

Fig. 5—Jig for Holding Tires while Bolting in Retaining Ring.

the downwardly impinging hot gases are deflected so as to rise along the inner surface of the surrounding tires, escaping at the top. To prevent the too rapid escape of heat from the top of the pile of tires, a circular plate of steel of the diameter of the tires is attached to the downward pipe of the combustion cham-

Making Bolt-head Dies.

ber casting. This plate is lined with asbestos to enable it retain heat the better.

Around the outside of the pile there is a bent piece of sheet iron, D, to reduce radiation as much as possible. The efficiency of the device may be judged from the heating capacity, a set of six tires requiring only about 20 minutes. The lower tire, of course, is heated more than the rest, a fact which consideration will show to be an advantage, it being the last tire to be removed from the pile.

The heating apparatus, carried on a cast-iron bracket from a vertical post, is counterbalanced by a weight E, so that it may be raised or lowered at will. A set screw engaging in a channel in the post prevents the apparatus from swinging out of a central position.

While the tires are heating, six pairs of blocks are arranged around on the floor within crane swing of the heating stand, the blocks being shown in fig. 4. As soon as the tires reach the desired heat they are in quick succession lifted off the pile and placed each on a pair of the previously arranged blocks, flanges up. As each tire is located, the corresponding centre is immediately dropped into the awaiting hot tire, where it quickly cools, giving the desired shrinkage fit.

The next operation is that of bolting on the retaining ring which is shown leaning against the assembled tire and centre in fig. 5. The manner of performing this job is a material advance on the old method of loosely mounting on a wooden rod, 6 or 8 ft. long, in the manner familiar to all. In this new method the tire is held by screws from the back, two formed holders A, fig. 5, as shown. These grips, or holders, are trunnioned as at B, in vertically adjust-

able stands C, adapted to accommodate a wide range of sizes. Being trunnioned in this manner, the wheel held, may be swung over into the most convenient position for the operator, the bolts being put through from one side, the whole swung over, and the nuts put on from the other.

Since these photographs were taken, a further refinement in this last device has been introduced. In the positions shown in fig. 5, some little difficulty was experienced in, first of all, placing the tired wheel in the trunnioned grips, as the stands would slip apart. In the present arrangement one of the stands is bolted rigidly to the floor, while the other is mounted on a hinged plate which can be swung back for the introduction of the wheel, and when swung again into normal position the grips fit on to the flanges on both sides.

Nothing now remains but to mount the wheels on their axles in the normal manner by a hydraulic wheel press, the wheels again being ready for use.

Making Bolt-head Dies at Montreal Locomotive Works.

The diesinker at the Montreal Locomotive Works, A. Bonenfant, has devised and is using a rather ingenious method for making bolt head dies for use in the upsetting machine.

The customary method, of course, is to first drill the die blank, then cut out the hole to a hexagonal or square shape as desired, and following this, fit into the bottom of this formed hole, a heading piece containing the chamfered edges, to give the top of the head the requisite shape. All this requires rather careful diesinking, and as the wear and tear on upsetting dies is heavy, the maintenance charge is kept at a high figure.

The method used by Mr. Bonenfant is simple in the extreme. The die blocks for a given machine are all of the same size, so one holder with cover plate suffices for the production of all the dies used for bolt-heading on one machine. This holder and cover with contained die block are shown in the accompanying illustration. A set of die punches of various sizes and of the shape indicated are used in conjunction with the holder.

The holder is gripped centrally in the stationary part of the upsetting machine and the die punch lined up in the ram. The die block heated to a working heat, is then located in place in the holder, and the cover swung into place. The ram then coming forward, as in any upsetting job, forces the die punch into the die block, quickly forming the die header. The surplus stock is forced out in a "flash" through a hole in the bottom of the die holder.

The die block thus produced is still a little rough, especially at the upper surface, where the edges are somewhat "drawn." The hole is forced slightly deeper than necessary to make provision for trimming this down. Likewise, the flash is faced off.

After the necessary tempering, the die is ready for service, a good die being produced at very small cost as compared to the usual method. All the bolt dies now used at these works are produced by this method, with very satisfactory results attending their use. They are quite as good as the built up dies.

Bay of Quinte Ry.—The trustees under a mortgage dated Jan. 2, 1902, to secure an issue of bonds of \$1,000 each, on Feb. 20, redeemed 50 of the bonds, the numbers of which were decided by lot, at 105 and accrued interest, out of the sinking fund.

Repairing Air Hose at the Intercolonial Ry. Moncton Shops.

It would seem as if there was no end to the number of different devices and modifications of well known devices for the repair and renewing of air hose. One arrangement has already been described in these columns, but the device shown in the accompanying illustrations is so different in construction as to warrant another description.

In the Michigan Central Rd. method, as outlined in The Railway and Marine World for Dec., 1911, there was but one horizontal cylinder, whereas in this device the rubber hose is itself held stationary by a clamp from above, very similar to the one described in the article mentioned, while the end connections are forced on by an air cylinder at each end. The principal feature of distinction in this mechanism lies in the cylinder under the bench and the functions it performs.

Instead of first removing the air hose with its forced-on end pieces for the purpose of squeezing up the hose clamps in a pneumatic vise, the hose is held in its last position, while the hose clamps are loosely slipped on. A cross bar at-

Mechanism for Renewing Air Hose at One Setting.

tached to the plunger rod of the lower cylinder connects at each of its ends to a pincer arrangement like a pair of ice tongs, so designed that as the plunger rises these tong fingers encircle the hose clamp, forcing it tight on to the hose. The bolt is then introduced and tightened up, completing the whole operation in one setting. The operation of the mechanism is clearly outlined in the accompanying illustration.

Michigan Central Rd.—Lake Shore and Michigan Southern Ry.—The New York Central and Hudson River Rd., which controls the above named railways, has sent a circular to the holders of the 3½% gold bonds, secured by shares of the Lake Shore and Michigan Southern Ry. and Michigan Central Rd. as collateral, asking their consent to a plan of merger of either or both of these roads with the New York Central and Hudson River Rd. Co.

The Bank of Montreal will open a branch in the C.P.R. Windsor St. Station, Montreal, as soon as the addition to the building is completed.

Steam Railway Statistics for Year Ended June 30, 1911

In the following table the column headed gross earnings includes passenger and freight earnings, as well as miscellaneous earnings; the next four columns give the operating expenses classified under their various headings, while the last gives the net earnings, which are arrived at by deducting the totals of the four columns referred to from the figures in the gross earnings column. The minus mark (—) before figures in the net earnings column shows that there was a deficit in the operations of the line to the extent of the figures given. The numbers in brackets—thus (1)—after the name of a railway refer to notes on page 111. The cents have been omitted in all cases, and the figures in the totals show the aggregate earnings, etc., including the cents, omitted from the detailed items.

Notes to Steam Railway Statistics.

(1) The Alberta Ry. and Irrigation Co. was operated under the control of the C.P.R. during the year, and has since been taken over in its entirety by that company. It includes the railways formerly owned by the Alberta Ry. and Coal Co., and the St. Marys River Ry.

(2) The Algoma Central and Hudson Bay Ry. and the Algoma Eastern Ry. (formerly the Manitoulin and North Shore Ry.) are owned by the Lake Superior Corporation.

(3) The Atlantic, Quebec and Western Ry. is operated by the same interests as the Quebec Oriental Ry., which was originally the Baie des Chaleurs Ry., and subsequently known as the Atlantic and Lake Superior Ry. The A.Q. and W. Ry. has trackage rights over 1.75 miles of the lines of other companies.

(4) The Great Northern Ry. owns and operates the following lines in Canada: Brandon, Saskatchewan and Hudson Bay Ry.; Manitoba Great Northern Ry.; Crow's Nest Southern Ry.; Red Mountain Ry.; Nelson and Fort Sheppard Ry.; Vancouver, Victoria and Eastern Ry. and Navigation Co.; New Westminster Southern Ry.; Victoria Terminal Ry. and Ferry Co.; and Victoria and Sidney Ry. The Manitoba Great Northern Ry. has trackage rights over 0.99 mile of another company's line. The Bedlington and Nelson Ry. mileage includes 8.67 miles operated under lease. The Nelson and Fort Sheppard Ry. mileage includes 5.42 miles of leased lines. The New Westminster Southern Ry. and the Vancouver, Victoria and Eastern Ry. have each trackage rights 1.48 miles over the Fraser River Bridge owned by the British Columbia Government.

(5) The British Yukon Ry. is the Canadian portion of the line operated as the White Pass and Yukon Route, connecting with steamboats on the Yukon River to Dawson in the summer, and with stages in the winter.

(6) The Intercolonial Ry. mileage does not include the Windsor branch 32 miles, operated by the Dominion Atlantic Ry. It has 16 miles of second track. It operates its trains into Montreal over the G.T.R., its trackage rights over foreign lines being 40.36 miles.

(7) Mackenzie, Mann and Co., Ltd., interests own or control and operate the following railways: Bay of Quinte Ry.; Brockville, Westport and North Western Ry.; Canadian Northern Ry.; Canadian Northern Ontario Ry.; Canadian Northern Quebec Ry.; Central Ontario Ry.; Halifax and South Western Ry.; Inverness Ry. and Coal Co.; Irondale, Bancroft and Ottawa Ry.; Quebec and Lake St. John Ry. and Schomberg and

Aurora Ry. The Bay of Quinte Ry. has trackage rights over 19 miles of another company's lines. The Central Ontario Ry. operates the line owned by the Marmora Ry. and Mining Co. (formerly the Ontario, Belmont and Northern Ry.). The Toronto-Ottawa section of the C.N.O.R. connects with the Central Ontario Ry. at Trenton, and runs over the B. of Q. Ry. between Deseronto and Sydenham. The Irondale, Bancroft and Ottawa Ry. connects with the C.O.R. near Birds Creek. The Canadian Northern Ry. figures include the statistics relating to traffic over the Manitoba Ry., which it operates under a lease from the Government of Manitoba. The lines included in the Manitoba Ry. are the Northern Pacific and Manitoba Ry., Winnipeg Transfer Ry., Portage and North Western Ry., and Waskada and North Eastern Ry. The Canadian Northern Quebec Ry. has trackage rights over 58.65 miles of other companies' lines. The Canadian Northern Ontario Ry. has trackage rights over 3.80 miles into the Union Station, Toronto. The Halifax and South Western Ry. has 2.30 miles of trackage rights over the Intercolonial Ry. into Halifax.

(8) The Canadian Pacific Ry. mileage includes 2,909.60 miles of main lines owned, 3,103.20 miles of branches and spur lines owned; 2,623.60 miles of lines of proprietary companies; 1,389.90 miles of lines operated under lease; 184 miles of lines operated under contract, and 37.30 miles of lines operated under trackage agreements. It has 451.70 miles of second track, on lines owned, and 165.80 miles on leased lines. The C.P.R. returns include the earnings and expenses of the Esquimalt and Nanaimo Ry. The lines operated by the C.P.R. include the Montreal and Atlantic Ry., which has 6.40 miles of second track, and a leased line—Lake Champlain and St. Lawrence Junction Ry. The C.P.R. also owns with the New York Central and Hudson River Rd., the Toronto, Hamilton and Buffalo Ry., and controls the Kingston and Pembroke Ry., which continues to report independently.

(9) The Dominion Atlantic Ry. operates under agreement the Windsor branch of the Intercolonial Ry., 32 miles, which is included in the D.A.R. mileage, but not in that of the I.R.C. It has also trackage rights over 14.42 miles of other lines. The D.A. Ry. has since passed under C.P.R. control, and is, since Jan. 1, being operated by it under lease, but a separate organization is maintained.

(10) The Grand Trunk Pacific Ry. is reported to be under construction, although it is being operated from Winnipeg to beyond Edmonton.

(11) The G.T.R. mileage includes the Buffalo and Lake Huron Ry., 161.30 miles, leased and partly owned. The G.T.R. figures include the earnings, etc.,

of the Magnetawan River Ry. It has 706.81 miles of second track, and has trackage rights over other lines totaling 13.71 miles. It also owns the Canada Atlantic Ry. and the St. Clair Tunnel Co., which report separately, and the G.T. Pacific Ry. The Central Vermont Ry., which operates the Montreal and Province Line; the Montreal and Vermont Jct. Ry. and the Stanstead, Shefford and Chambly Ry.

(12) The Hereford Ry. is owned and operated by the Maine Central Rd., which also owns the Princeton branch, Washington County Ry.

(13) The International Ry. of New Brunswick was originally known as the Restigouche and Western Ry. It was not being operated when the returns were sent in.

(14) The Kingston and Pembroke Ry. passenger and freight earnings are in excess of the amount given in the column headed gross earnings, the difference being that \$7,035 marked "Cr" in the account of earnings other than from operation has to be deducted before the gross earnings can be ascertained.

(15) The London and Port Stanley Ry., practically owned by the city of London, Ont., is leased to the Lake Erie and Detroit River Ry., which is owned and operated by the Pere Marquette Rd., a U.S. company. The P.M.R. has trackage rights over 136.57 miles of other Canadian lines.

(16) The Massawippi Valley Ry. has trackage rights over 2.95 miles of another company's lines. It is operated by the Boston and Maine Rd.

(17) The Morrissey, Fernie and Michel Ry. includes 5.03 miles of leased lines. It is owned by the Crow's Nest Pass Coal Co.

(18) The New Brunswick Ry. and Coal Co. is operated by a commission appointed by the New Brunswick Government.

(19) The New York Central and Hudson River Rd. owns the Ottawa and New York Ry., and the St. Lawrence and Adirondack Ry. It also controls the Toronto, Hamilton and Buffalo Ry.; the Rutland Rd., which owns the Rutland and Noyan Ry.; and the Michigan Central Rd., which controls the Canada Southern Ry. This line has 226.18 miles of second track on main lines, and 16.80 miles of second track in branches and spurs. The Ottawa and New York Ry. operates 1.90 miles under trackage rights. The St. Lawrence and Adirondack Ry. mileage includes 13.30 miles of leased lines, and it has also trackage rights over 8.92 miles of other companies' lines.

(20) The Quebec Ry. Light and Power Co. reports as to the operation by steam over the old line of the Quebec, Montmorency and Charlevoix Ry. There

are 6 miles of second track and 3 miles operated under contract.

(21) The Quebec, Montreal and Southern Ry. includes the old East Richelieu Valley Ry., the United Counties Ry. and the South Shore Ry. It is owned by the Delaware and Hudson Co., which also owns the Napierville Jct. Ry.

(22) The Sydney and Louisburg Ry. is owned by the Dominion Coal Co. It operates 1.09 miles of line owned by a proprietary company and has trackage rights over 1.20 miles of other lines. It also owns the Cumberland Ry. and Coal Co.

(23) The Temiskaming and Northern Ontario Ry. is owned by the Province of Ontario and is operated by a Commis-

sion. It also owns the Nipissing Central Ry., an electric line.

(24) The Toronto, Hamilton and Buffalo Ry. is owned by the New York Central and Hudson River Rd., and the C.P.R. It has 4.16 miles of second track and has trackage rights over 4.36 of foreign lines.

(25) The Wabash Rd. does not own any track in Canada, but operates over G.T.R. tracks under lease.

The Bessemer and Barrys Bay Ry., the Bruce Mines and Algoma Ry., the Pontiac and Renfrew Ry., and the Vancouver Copper Co.'s railway are not being operated. The Nosbonsing and Nipissing Ry., and the Wellington Colliery Co.'s line have apparently not reported.

PROPOSED LENGTHENING OF RAILWAY TIES.

Discussion by the Canadian Society of Civil Engineers.

The question of the best length for ties has been under the Canadian Society of Civil Engineers' consideration during the past two years. At the annual meeting in Winnipeg, in January, 1911, the chairman of the committee of ties, D. MacPherson, then Assistant Chief Engineer, National Transcontinental Ry., now Assistant to the Chairman, N.T.R. Commission, presented a report, from which some members of the committee dissented, arguing strongly in favor of longer ties than were in use, and suggesting experimental tests with ties 10½ ft. long. This report was published in full in *The Railway and Marine World* for March, 1911, together with the views of the dissenting members of the committee. As it was evident that there was considerable divergence of opinion on the question, we obtained the views of a number of leading railway engineers, roadmasters, etc., and published the same in our issues of April and May, 1911, the whole forming a valuable collection of opinions on a very important subject.

The committee's report that experimental tests be made with 10½ ft. ties does not appear to have been carried into effect.

In May, 1911, the Society's Secretary notified the members of the committee of their reappointment.

J. G. Sullivan, C.E., C.P.R. Western Lines.

Mr. Sullivan wrote Mr. MacPherson, June 5, 1911, agreeing to serve on the committee, and pointing out that in the committee's report above referred to "there was not only an error in figures, but also a very serious error in principles." Mr. Sullivan continued: "Leaving aside all the features that make it unnecessary to tamp under the centre of the ties, and assuming that it would be good railroading to so tamp ties (which, of course, I do not admit), the only place a tie is apt to break is under the rail or at the centre. Now, if you will figure up the strain, putting the moment at the centre of the tie equal to the moment underneath the rail, I think you will soon discover the error I allude to. To make the case a little more clear. Imagine the tie turned upside down, the rails a support, and the tie carrying a uniform load. I think you will find that theoretically the length of tie for a safe load is considerably less than 9 ft."

Mr. MacPherson's Reply

On July 20, 1911, Mr. MacPherson wrote Mr. Sullivan as follows:—"If all members of the committee, in addition to the interest they take in this matter, would show that interest as practically as you are doing, we should soon thresh out some useful information. We must, however, each be careful to try to look at the matter, not only from our own, but from the other fellow's point of view. I am quite willing to admit the

words 'firmly tamped for its entire length,' may be misleading. It would be better to say tamped for its entire length in such a way as to give, as nearly as possible, uniform support, having regard

P 254 D. MacPherson,
Chairman, Canadian Society of Civil
Engineers' Committee on Ties.

to the distribution of the load, that is, tamped hard under the rail and for a distance say 18 ins. each way, from edge of rail base, and outer ends tamped more firmly than at centre of track. I have not entirely overlooked the principles of the bending moment you refer to, and agree with you that the moment is greater under the rail for a 10 ft. tie than for an 8 ft. tie, but it is less at the centre for the longer tie. Ties are more apt to break at the centre than under the rail, when frost is coming out, and that is about the only place and time good ties ever break, therefore, the lessening of the moment at centre should be an improvement. I have used 10 ft. and 12 ft. ties, with excellent results, over bogs and places where track could not be kept in surface or line with 8 ft. ties, and have never known a long tie to break under such circumstances. Does not this indicate that the bending moments in the tie may not be as important as providing an increased area of foundation for the immensely increas-

ed weights of recent years. Your illustration of turning the tie upside down, supported on the rails, and assuming load uniformly distributed, certainly facilitates calculation of the stresses, but unfortunately we know the load is not uniformly distributed, hence calculations based on that assumption are inconclusive. In any case, they only refer to the strength of the tie and not to its effectiveness in providing, as nearly as is possible uniform minimum unit pressures on the ballast. I will, in turn, make a suggestion to illustrate my point of view. Assume that the ties are sawn straight through in the centre and the spreading of the track taken care of by steel, the rods bolted to the rails. Would not the outer ends of 8 ft. ties be immediately crushed into the ballast and the inner ends be cocked up? Would this happen if ties were of equal length each side of rail, and if not, does it not prove that lengthening the ties is not altogether folly?"

Circular to Members of Committee.

In July, 1911, Mr. MacPherson sent the following circular to members of the committee:—"As the committee on ties has been continued from last year, with the understanding that only those who expressed a willingness to act need be considered as members, I would advise you that the men whose names appear on this letter have stated their readiness to act, which should assure a good live report for next annual meeting. Unless the majority of the members of the committee wish otherwise, it might be well to confine our work this year entirely to determining what, in our opinion, are the best dimensions for ties for a standard trunk line railway, and not go into tie preservation or cost at all. Of course the question of cost is very vital, but the first and most important things to determine are the proper dimensions to give the best results. I enclose copy of some correspondence between one member of the committee and myself, which may help to set the ball rolling, and I would ask each member to contribute something definite on the subject as early as possible, avoiding generalities and giving logical reasons for all theories advanced. As soon as all the members contribute something on the subject, I shall call a committee meeting, when we can exchange views more fully and perhaps evolve matter for further enquiry or discussion. In the meantime, I hope you will pitch into the two of us who have so far committed ourselves to paper and handle our theories without gloves, so long as you evolve something better or advance arguments which prove our points of view to be erroneous."

The members who consented to act on the committee were D. MacPherson, Chairman; F. P. Gutelius, H. G. Kelley, Wm. McNab, J. G. Sullivan, T. C. Burpee, H. A. Woods, M. H. MacLeod, W. A. Bowden, W. B. Mackenzie.

H. G. Kelley, Chief Engineer, G.T.R.

Mr. Kelley wrote Mr. MacPherson July 31, 1911, as follows:—"I have read with interest the letter from J. G. Sullivan to you upon the subject of ties, and your circular letter to the committee. The matter seems to have been well studied from a mathematical point of view, yet without reaching a unanimous conclusion. I intend, therefore, in this letter, to discuss it purely from practical conclusions derived from experience and observation.

"Upon first class rock ballasted track with embankments and ballast, old and well settled, there is but little trouble with ties breaking. Upon good gravel track, well maintained, the breakage under the rail is more frequent than breakage in the centre of the track, except in the case of centre bound track. Upon unballasted or earth surfaces track, the breakage is about evenly divided; if

there is any difference, I believe the breakage under the rail is in excess. In the above three cases, I am considering track laid with the ordinary sized tie, 6 by 8 ins. by 8 ft. long. Would not the above indicate that so far as strength is concerned, the extension of an 8 ft. tie beyond the rail is already as long as it should be to balance the stress upon the middle of the tie?

"Upon all track, the primary object to be attained is drainage, and any type of construction which retards the drainage, injures the track and places a greater physical stress upon the ties.

"In the Southern States many years ago, where ballast was scarce, rains plentiful and track bad, a road running from Memphis, Tenn., to Little Rock, Ark., tried the experiment of using ties 9 ft. long. After a few years their use was abandoned as being a detriment to the track on account of the retarding of the drainage, and the company returned to the use of ties 8 ft. long. Other roads in the northern parts of the U.S. have used 9 ft. ties, but so far as I know, their use has been discontinued, and only in some instances have the roads adopted as their standard ties 8½ ft. long.

"In view of the above facts, I believe that the maximum length of the tie should not exceed 8½ ft., and that a tie 8 ft. long will answer all purposes for modern traffic, and enable the maintenance departments of railroads to maintain first class track. I believe, however, that ties 6 ins. thick are not sufficiently strong, and that ties for main line traffic should be 7 ins. thick by at least 8 ins. wide, but that in no case should they be more than 10 ins. wide."

H. A. Woods, Asst. Chief Engineer, G.T.P.R.

Mr. Woods wrote Mr. MacPherson, on Aug. 9, 1911: "I think the committee will agree that the ordinary tie 6 by 8 ins. by 8 ft. in length, with, as generally spaced, 22 in. centres, does not give sufficient bearing for the rolling stock now in use. To add to this bearing surface, shall we increase the length of the tie, as suggested in your report last season, or adopt some other conclusions. Evidently, there is a diversity of opinion as to the actual theoretical length of a tie for a safe load, and there will doubtless be a further discussion on that subject.

"Personally, I think the increased length suggested is hardly justified by past experience. Several railways in the U.S. at one time called for ties 9 ft. long, but I do not know of any using that length at the present time. The Pennsylvania Rd. and the New York Central, with some of its allied lines, are calling for ties 7 ins. by 7 ins. by 8½ ft. long. Would not this indicate, in a measure at least, that ties even 9 ft. in length were undesirable, either on account of additional cost, or difficulty in procuring them?

"In my opinion a 10 ft. tie, aside from the difficulty in procuring it, and the additional cost (which would be almost prohibitive), has other disadvantages, among which are increased breakage over the shorter tie, retarded drainage, and additional ballast required.

"Personally, I believe that ties should not be less than 7 ins. in thickness, 8 ins. on face, and 8 or 8½ ft. in length; that they should be laid with 20 in. centres, 20 to a 33 ft. rail length. Ties are so spaced on several railways at the present time. With this number of ties of the dimensions named, and with proper ballast, I believe that first class track can be maintained."

F. P. GUTELIUS, then General Superintendent, Eastern Division, C.P.R., wrote Mr. MacPherson Oct. 7, that he desired to put himself on record as being opposed to making ties more than 8 ft. long.

Report by the Chairman.

Mr. MacPherson wrote the Society's Secretary on Nov. 28, 1911, as follows:—

"I attach for the council's information copies of correspondence I have had in this connection, from which it will appear that only four out of the nine members have taken any part in the discussion, and that two of them are in favor of using ties not longer than 8½ ft.; one sticks to the 8 ft. length without, however, advancing any reasons to support his views. Under these circumstances it seems impossible to present anything that could be called a report of the committee, hence I submit the correspondence for such action as the council may deem advisable, and in doing so desire to say that this year's discussion, in my opinion, has not disclosed any definite or conclusive reasons to approve that ties shorter than 10 ft. meet the requirements of the standard modern track, required to support the immensely increased loads of up-to-date rolling stock.

"Perusal of the reports and discussions of the American Railway Engineering Association's committee on ties for several years past will disclose the fact that many members of that association are of the opinion that longer ties are necessary, but that they hesitate to recommend the same definitely for fear of seeming to commit the roads they represent to large increases of expenditure. It would be equally logical to advocate using a 56 lb. rail for the same reason. The chief engineers of the London and North Western Ry., and of the Midland Railway, of England, inform me that

CANADA'S GREAT MARKET FOR EQUIPMENT AND SUPPLIES.

From the Toronto News, Feb. 6:

"All the Canadian railways have been recently forced to go abroad with orders because they could not secure the necessary number of locomotives at home within a reasonable time.

"The same remark applies to other lines of equipment, such as passenger and freight cars, and altogether the outlook for companies interested in railway equipment and supplies appears to be particularly good."

their standard tie is 9 ft. long. These are two of the best maintained roads in the country, but their locomotives are probably not more than two-thirds the weight of the heavy locomotives used on this continent, and the axle loads are lighter in proportion.

"Ties 9 ft. long have been used in Texas over 30 years, with mud ballast, which would indicate that the advantage of increased bearing must more than offset the disadvantages of drainage, even in bad ballast, and these disadvantages would not be so great in gravel ballast.

"The Chief Engineer of the Louisville and Nashville Ry. informs me that they used 10 ft. ties with sand ballast, and had no difficulty with drainage, or trouble with ties breaking under the rail. They now use blast furnace slag for ballast in place of the sand, and their standard tie is 9 ft. long.

"Some ten years ago I had personal experience with a piece of track, about one-half mile long, over muskeg, on the C.P.R., which piece of track it was impossible to keep in surface or line with ties 8 ft. long. An experiment was tried with ties 12 ft. long, and that length of tie has been used there ever since with perfectly satisfactory results. The roadmaster recently informed me that he had no trouble with the long ties breaking, and that this summer he had treated another muskeg the same way, with the result that a half-mile of 7 mile section, which with 8 ft. ties had taken 50% of the time of the section gang to

keep in order, had, since the placing of the 12 ft. ties, scarcely needed any attention, and remained in good surface and line.

"These examples would indicate that there is not much danger of 10 ft. ties breaking, and that they do give the much needed additional support.

"I am sending a copy of this letter to each member of the committee, but do not propose to submit any further formal report."

The matter came up at this year's annual meeting Jan. 26, but was not discussed, as it was decided to request all the Society's branches to discuss the various reports and send the discussion to the Secretary by March 1. Each committee is then to take the discussion on its report into consideration, and ask by July 1 for a letter ballot of the Society's members on the final draft of the report.

Adirondack and St. Lawrence Railroad Locomotive.

The Adirondack and St. Lawrence Rd. has received recently a Mogul locomotive for freight service which exerts a tractive force of 24,800 lbs. The equipment includes automatic and straight air brakes, and M.C.B. couplers front and back. Pilots and headlights are also applied at each end, the pilots being of pressed steel of a new design. The fire-box is placed above the frames and is fitted with a brick arch supported on studs. The frames are of forged iron with double front rails. In all other respects this locomotive is designed and equipped in accordance with the present day practice for engines of this class. Following are the principal dimensions:—

Cylinders		18 x 24 ins.
Valves		Balanced slide
Boiler—type		Wagon top
" Material		Steel
" Diameter		56 ins.
" Thickness of sheets		5/8 & 11-16 ins.
" Working pressure		180 lbs.
" Fuel		Soft coal
" Staying		Radial
Fire Box—Material		Steel
" Length		74 11-16 ins.
" Width		40 ins.
" Depth, front		61½ ins.
" Depth, back		60 ins.
" Thickness of sheets, sides		5-16 in.
" Thickness of sheets, back		5-16 in.
" Thickness of sheets, crown		3/8 in.
" Thickness of sheets, tube		1/2 in.
Water Space—Front		4 ins.
" Sides		3½ ins.
" Back		4 ins.
Tubes—Material		Iron
" Thickness		No. 11 W.G.
" Number		206
" Diameter		2 ins.
" Length		11 ft.
Heating Surface—Fire box		111 sq. ft.
" Tubes		1,177 sq. ft.
" Total		1,288 sq. ft.
" Grate area		20.7 sq. ft.
Driving Wheels—Diameter, outside		48 ins.
" Diameter, centre		42 ins.
" Journals, main		8 x 9 ins.
" Journals, others		8 x 9 ins.
Engine Truck Wheels—Diameter, front		26 ins.
" Journals		5 x 8 ins.
Wheel Base—Driving		12 ft. 6 ins.
" Total engine		20 ft. 0 ins.
" Total engine & tender		46 ft. 11½ ins.
Weight—On driving wheels		101,000 lbs.
" On truck, front		17,500 lbs.
" Total engine		118,500 lbs.
" Total engine & tender		210,000 lbs.
Tender—Wheels, number		8
" Wheels, diameter		30 ins.
" Journals		4¼ x 8 ins.
" Tank capacity		4,500 gals.
" Fuel capacity		8 tons

It was built by the Baldwin Locomotive Works, Philadelphia.

The Canadian Transfer Co.'s annual meeting was held at Montreal, Jan. 30. The following were re-elected directors: C. Cassils, Hugh Paton, G. R. Starke, Sir Montagu Allan and H. M. Molson. F. M. McRobie is General Manager and Secretary.

How to Remedy Soft Spots in the Roadbed.

At the Roadmasters and Maintenance of Ways Association's last annual meeting at St. Louis, Mo., the committee on the above subject presented the following report:—

Before suggesting a remedy for the cure of soft spots in a roadbed, we think it would be well to determine the cause of the troublesome places, as we think it would be far more economical to avoid them, in the first place, than later to spend the greater part of the allowance for maintenance trying to keep the track at such places in surface line and gauge, and ultimately go to the expense of tile and cross draining, which is the only effective method after the pockets have reached a depth where it is impossible to drain them by ordinary surface ditches.

Soft spots in roadbed, on fills, are caused usually by objectionable material (usually clay from the bottom of barrow pits, or stumps or other timbers

Figure 1.

which are placed in the dumps by the contractors in order to complete the job as quickly and cheaply as possible). Decomposing timber and the gumbo clay of which the sub-grade is constructed fail to support the track under heavy traffic and the weak places are shortly replenished with ballast of some kind and a typical soft spot is formed. Where these spots are caused by stumps or timbers placed in the dump they should be removed or one may expect to have trouble until they have rotted entirely away.

When the sub-grade is constructed of clay of various kinds, the worst material perhaps is what is familiarly known as gumbo. Where rainfall is great, this clay gives little chance for water to run off, and it generally stands in pockets in the dump and changes from one side of the track to the other, causing the clay to heave upward and bulge out on sub-grade at base of ballast. To overcome this a trench should be dug as shown in fig. 1, beginning at the opposite side of the track and digging through the bulge to the base of the dump. This trench should be dug a foot or 18 ins. below the bottom of the pocket and as far apart as the formation of the sub-grade requires them. They should be 18 ins. wide to allow free working of men. Fill in the bottom

ties to maintain the surface temporarily. Very often the timber is left there when the ballast is finally received and applied. The renewal of the ballast is repeated at intervals until it is from 18 ins. to 5 ft. deep. The clay that has been displaced by the ballast is forced outward and upward just outside the ballast line which intercepts the passage of water from the pocket to the open ditch, making it a difficult matter to drain it properly.

Many methods have been tried, with varying success, to remedy these soft spots, and we will take them in order, as their location and the amount of money available, must determine, very often, the method to be employed. Before considering the more expensive methods we will take up the question of surface drainage.

Where the conditions require it, a surface ditch should be constructed and maintained on the top of the cut, to care for the water running toward the cut from adjoining fields, and an open ditch on each side of the track in cuts should be constructed only deep enough to carry the water it is expected to take care of. Open ditches should be kept clean and free from obstructions, so that no water will stand in them. Where standing water cannot be taken care of the ditches should be tile drained.

Where good surface drainage has failed, on account of the bottom of the pocket at a soft place becoming lower than the bottom of the adjoining ditch, making it impossible to drain it, the ballast may be removed, together with

Figure 2. Profile.

the clay shoulder which has heaved at either side, and the cavity should be filled with harder material, practically forming a new sub-grade. This will remove the pocket which causes the trouble and will be found very satisfactory.

Where authority for tile draining ditches and roadbed may be had, it will be found to give the best results, however, and it is only a question of the best kind of tile to be used and the best and most economical method to be employed in order to get the best and most lasting results.

COST PER DRAIN

to shape the bottom of the trench, so that the tile will lie in a round surface instead of on flat ground. This will have a tendency to keep the tile in perfect alignment and surface. When the tile is laid, fill the trench with engine cinders. Cross trenches should be dug as the conditions require it and filled with engine cinders as shown in fig. 2. The cost of this work varies greatly, being governed a great deal by local conditions and the kind of labor employed. The figures given in connection with fig. 1, however, were taken from a job recently completed and are authentic.

Fig. 3 shows a method of tiling and cross-draining which has been found very satisfactory. The depth of the tile drain should be governed entirely by local conditions, but should be below the

Figure 3. Section.

frost line. The grade line should be determined by a competent engineer, in order to insure satisfactory results and perfect drainage. Use vitrified tile with bell ends not less than 6 ins. in diameter. A line may be laid on one or both sides of the cut, as may be deemed necessary. The trench should be excavated 3 ins. below the grade line and dirt should be trucked out of the cut and placed on the fill for widening the roadbed. Then fill the trench 3 ins. deep with engine cinders well tamped. Then lay tile with the bell ends up stream on cinders in perfect line and surface, after which back fill the trench with cinders. Where pockets have formed in the roadbed, cross drains should be put in. Where a drain is constructed on both sides of the track, cross drains should be put in alternately from the centre of track to the drains on either side, as the local conditions may require it, and should be connected with the tile with a "T." Vitrified tile or short lengths of cast iron pipe is best for cross draining. Care should be used in establishing a grade line so that the tile will be laid deep enough to permit cross drains to be put in at any time below any deformation or pocket in the roadbed.

Fig. 4 shows a plan for draining a cut which is expected to be double-tracked later. A single line of pipe on one side,

Figure 3.

Figure 4.

with coarse engine cinders to a height of 15 ins., the balance of trench with ordinary cinders, using care to keep the outlet free at all times.

In cuts, soft spots are formed by pockets of plastic clay or depression in the sub-grade which, on account of insufficient drainage, become thoroughly saturated during wet weather. This forms poor support for the ballast and allows the track to settle and forces the ballast below the subgrade. Ballast of some kind is ordered and in the meantime mud shims, or often crossing plank or ties are placed under the track

Fig. 2 shows a method of tile and cross draining the roadbed which has been found satisfactory. Beginning at the outlet, dig a trench 18 ins. wide parallel with the track, so that the tile when laid will be 9 ins. out from the ends of the ties and not less than 18 ins. below the pockets to be drained, being careful not to get less than 12 ins. fall in 1,000 ft. Lay either 4-in. or 6-in. glazed tiling with bell joints the entire length of the cut, carrying the water from the apex both ways, or all one way, as the conditions may require. Before laying the tile, use a round-pointed tool

laid as shown in fig. 3, with cast iron cross drains at intervals to a catch basin on the opposite side to take care of surface water. When second track is laid the ditch should be partly filled with cinders, which will insure good drainage for the second track and an additional line of pipe should be laid outside of the new track.

To get good results, these tile ditches should be cleaned off as often as it is necessary, which is governed by weather conditions and the nature of the cut in which they are placed. Concrete catch basins placed at intervals as conditions

require, to care for the surface water more quickly, will be found very satisfactory in times of heavy rainfall. There is a great difference of opinion as to the kind of tile which is best for this work. We would say to use the kind of tile best suited for the soil and local conditions which will be encountered at the point to be drained. The cost of construction for labor varies so greatly, being governed by the kind of labor employed and the conditions under which the work is to be done, that figures will be of little value, as it runs from 10 to 30 cents per foot, but at the maximum figure the benefits derived are so great that they warrant the expenditure.

We would recommend that more attention and care be given to roadbed construction when railways are constructed, and that such important matters should not be left to the discretion of contractors.

In the construction illustrated by fig. 1 use engine cinders for back-filling and cap with recovered ballast. The fall of the bottom of the drain should not be less than 12 ins. in 1,000 ft. and should reach at least 18 ins. below working gumbo.

In the construction illustrated by fig. 2 a concrete headwall is recommended with sufficient drop to prevent back filling of the drain. The fall of the drain should not be less than 12 ins. in 1,000 ft. The tile should be laid at least 18 ins. below the heaving gumbo. Use 6-in. tile, and engine cinders for back-filling, with cinder laterals where necessary.

In the construction illustrated in fig. 3 the trench should be excavated 3 ins. below the grade line and filled to that depth with cinders, tamped. The trench should be back-filled with cinders after pipe is laid. All dirt excavated from trench should be removed from the cut and used in widening banks. The vitrified pipe used should not be less than 6 ins. in diameter. Where conditions warrant vitrified pipe may be placed on one side only. Where there are signs of water percolating through the earth under the track, cross drains should be constructed under track extending from centre of track to vitrified pipe. These cross drains should be constructed alternately from one vitrified pipe, and then the other end placed at such intervals as local conditions may warrant. Cross drains under track should be cast iron and not less than 4 ins. in diameter and of short lengths. Where cross drains are used they should be connected with vitrified pipe by the use of a "T" connection. The ends of cross drains under track should be covered with broken stone to keep out the dirt. The vitrified pipe, where possible, should be laid deep enough so that cross drains, when used, can be placed below any pocket or deformation in roadbed.

In the construction illustrated in fig. 4 the trench should be excavated 3 ins. below the grade line and filled to that depth with cinders and well tamped. The trench should be back filled with cinders after the pipe is laid. All dirt excavated from trench should be removed from cut and used in widening banks. The vitrified pipe used should not be less than 6 ins. in diameter. The pipe used for cross drains should be less than 4 ins. in diameter and should be of short lengths. Cross drains should be connected with vitrified pipe by the use of a "T" connection. Cross drains and catch basins should be constructed at such intervals as local conditions may require, but generally never nearer than 400 feet apart. Catch basins should be provided with a grated cover. Water on the catch basin side of the track should be drained into catch basins through open ditches. When second track is constructed catch basins should be covered with broken stone and additional pipe constructed in the ditch outside of second track.

Steam Railway Statistics for Canada for 1910-1911.

The statistics for the year ended June 30, 1911, show that the total mileage of main track was 25,400, an increase of 669 miles over June 30, 1910. In addition there were 7,159 miles of second and other tracks, making altogether 32,559 miles in operation. Over 7,000 miles of line were reported to be under construction, of which 1,578 were in actual operation, although not on June 30, declared to be so by the Board of Railway Commissioners. The railway mileage in the several provinces in operation, as compared with June 30, 1910, was as follows:—

	Miles.	Miles.
Ontario	8,322	8,230
Quebec	3,882	3,795
Manitoba	3,466	3,221
Saskatchewan	3,121	2,932
British Columbia	1,842	1,832
New Brunswick	1,548	1,522
Alberta	1,494	1,488
Nova Scotia	1,354	1,351
Prince Edward Island	269	269
Yukon Territory	102	91

Total 25,400 24,731

The total capital liability was \$1,528,689,201, of which \$749,207,687 represented capital stock, and \$779,481,514 funded debt. This is an increase of \$61,650,300 in stocks, and \$56,741,214 of funded debt, a total of \$118,391,514 for the year. After making deductions for duplication of stocks and bonds owing to amalgamations, etc., and the situation with respect to Government lines, the capital liability is shown to be \$55,829 a mile. The total amount paid in dividends on the capital stock was \$30,577,740, or at the rate of 4.08%, against an average of 3.16% paid on the \$687,557,337 of capital stock for 1909-10. The net earnings—the difference between operating income and operating expenses, was \$57,698,709 against \$53,550,777 or 7.70% on the capital stock, against 7.78% on the capital stock in 1909-10.

The cash aid given during the year totalled \$1,426,192, of which \$1,284,892 was paid by the Dominion Government, \$82,000 by the provinces, and \$59,000 by municipalities. These figures bring the amount paid in aid of railway construction by the Dominion Government to \$148,217,072; by the Provincial Governments to \$35,919,360, and by municipalities to \$18,042,823, making a total of \$202,179,255. In addition land grants by the Dominion and Provincial Governments have aggregated 55,256,429 acres, and outstanding guarantees on June 30, 1911, reached \$148,336,357.

The earnings from all sources aggregated \$188,733,494, an increase of \$14,777,277 in the year, the sources of revenue being as follows:—

	1910-11.	1909-10.
Passengers	\$ 50,566,893.98	\$ 46,018,879.56
Mails	1,869,413.89	1,799,887.80
Express	4,674,135.27	4,143,837.52
Baggage, parlor cars, etc.	1,207,555.31	993,613.63
Freight	120,570,533.52	117,497,604.03
Station and train privileges	826,251.92	679,061.12
Telegraphs, rents, etc.	3,018,709.92	2,823,333.47

The operating expenses increased \$10,629,344.53, the comparative distribution being:—

	1910-11.	1909-10.
Way and structures	\$ 29,245,093.22	\$ 27,035,603.46
Equipment	26,127,638.12	26,002,301.30
Traffic expenses	4,831,744.50	4,366,176.92
Transportation	66,343,269.58	58,928,170.74
General expenses	4,487,039.53	4,073,188.00

\$131,034,784.95 \$120,405,440.42

The railways carried 37,097,713 passengers and 79,884,282 tons of freight, an increase of 1,203,143 passengers and 5,401,416 tons of freight over 1909-10. The following tables give general statistics regarding traffic:—

	1910-11.	1909-10.
Number of passengers	37,097,713	35,894,675
Passengers carried one mile	2,605,968,924	2,466,729,664

Passengers one mile per mile of line	102,597	99,742
Passengers per mile of line	1,460	1,451
Average passenger journey (miles)	70	69
Average number of passengers per train	60	59
Passenger train mileage	36,985,911	35,022,541
Mixed train mileage	6,277,468	6,441,440
Earnings from ticket sales	\$50,566,894	\$46,018,880
Earnings from passenger service	\$58,317,998	\$52,956,219
Average receipts per passenger	\$1.360	\$1.282
Average receipts per passenger per mile (cents)	1.944	1.866
FREIGHT TRAFFIC. 1910-11. 1909-10.		
Tons hauled	79,884,282	74,482,866
Tons hauled one mile	16,048,478,295	15,712,127,701
Tons hauled one mile per mile of line	631,829	635,321
Average haul, miles	200	211
Freight train mileage	52,498,866	50,184,108
Mixed train mileage	6,277,468	6,441,440
Revenue from freight	\$124,743,015	\$116,229,894
Average tons per train	305	311
Average cars per train	18.03	18.15
Average tons per car	16.91	17.13
Average receipts per ton per mile (cents)	.777	.739

The freight business was distributed among the following classes:

Products of agriculture	13,809,536	12,891,351
Products of animals	3,190,702	2,765,006
Products of mines	28,652,236	26,152,022
Products of forest	13,238,347	13,068,940
Manufactures	13,575,987	10,014,279
Merchandise	2,438,089	2,518,190
Miscellaneous	4,981,385	7,073,078

Totals Tons 79,884,282 74,482,866

Further details of earnings and operating expenses are as follows:

Gross earnings	\$188,733,494	\$173,956,217
Net earnings	57,698,709	53,550,776
Gross earnings per mile	7,430.45	7,033.93
Net earnings per mile	2,271.60	2,165.83
Earnings per passenger	1.363	1.282
Earnings per ton	1.561	1.560
Earnings per passenger train mile	1.348	1.277
Earnings per freight train mile	2.376	2.316
Earnings per train mile, all trains	2.103	2.036
Operating expenses	131,034,785	120,405,440
Operating expenses per mile	5,158.85	4,868.60
Cost of running trains one mile	1.460	1.409
TRAIN MILEAGE. 1910-11. 1909-10.		
Passenger trains	36,985,911	35,022,541
Freight trains	46,220,813	43,742,668
Mixed trains	6,277,468	6,441,440
Special trains	232,341	202,592

Total	89,716,533	85,409,241
FREIGHT CAR MILEAGE. 1910-11. 1909-10.		
Loaded freight cars	946,946,917	910,558,711
Empty freight cars	311,984,866	280,255,329
Caboose cars	47,834,318	45,367,459

Total 1,306,766,101 1,236,481,499

There were 4,219 locomotives, 4,513 passenger cars, 127,153 freight cars, and 9,578 cars in the service of the several companies, against 4,079 locomotives, 4,320 passenger cars, 119,713 freight cars, and 8,648 cars on June 30, 1910.

The returns of accidents show that 493 persons were killed and 3,329 injured, a decrease of 120 in the number killed, but an increase of 1,190 in the number injured as compared with 1909-10. There were 465 persons killed and 1,906 injured by the movement of trains, distributed as follows:—

	Killed.	Injured.
Passengers	28	288
Employees	202	1,314
Trespassers	185	154
Non-trespassers	48	135
Postal clerks, etc.	2	15

One passenger in every 1,324,919 was killed and one in every 124,489 injured. Accidents at highway crossings resulted in the killing of 36 persons, against 63, and in the injuring of 108 against 155 as compared with 1909-10.

The number of railway employees on June 30, 1911, was 141,224, against 129,768 on June 30, 1910. The aggregate of salaries and wages paid was \$74,613,738, an increase of \$7,445,945.

Birthdays of Transportation Men in March.

Many happy returns of the day to:—

W. G. Annable, General Passenger Agent, C.P.R. Atlantic Steamship Lines, Montreal, born at Ottawa, Mar. 3, 1875.

P. S. Archibald, M. Can. Soc. C.E., Commissioner New Brunswick Coal and Ry. Co.'s Railway, and General Manager, Elgin and Havelock Ry., Moncton, N.B., born at Truro, N.S., Mar. 21, 1848.

George Bury, Vice President and General Manager, C.P.R. Western Lines, Winnipeg, born at Montreal, Mar. 6, 1866.

Allan Cameron, General Traffic Agent, C.P.R., New York, born near Owen Sound, Ont., Mar. 14, 1864.

F. G. J. Comeau, General Freight Agent, Dominion Atlantic Ry., Halifax, N.S., born at Meteghan River, N.S., Mar. 10, 1859.

A. E. Cox, Storekeeper, Canadian Northern Ry., Winnipeg, born at Huddersfield, Eng., Mar. 12, 1863.

N. Curry, President, Canadian Car and Foundry Co., Ltd., Montreal, born in King's county, N.S., Mar. 26, 1851.

Patrick Dubee, Secretary, Montreal Tramways Co., Montreal, born there, Mar. 4, 1876.

G. R. Fairhead, District Freight Agent, Canadian Northern Ry., Hamilton, Ont., born at Toronto, Mar. 6, 1882.

C. Forrester, Trainmaster, G.T.R., Stratford, Ont., born at Wanstead, Ont., Mar. 5, 1876.

C. O. Foss, District Engineer, National Transcontinental Ry., St. John, N.B., born at Wentworth, N.H., Mar. 20, 1852.

H. M. Gain, Passenger Trainmaster, Eastern Division G.T.R., Montreal, born at Lindsay, Ont., Mar. 21, 1879.

R. A. Gamble, Car Service and Fuel Agent, C.P.R., Moose Jaw, Sask., born at Dublin, Ireland, Mar. 1, 1876.

H. W. Gays, General Manager, Ottawa and New York Ry., Ottawa, Ont., born at Brant, Erie Co., N.Y., Mar. 21, 1848.

J. Halstead, Division Freight Agent, C.P.R., Calgary, Alta., born at Bracebridge, Ont., Mar. 2, 1877.

R. M. Hannaford, M. Can. Soc. C.E., Chief Engineer, Montreal Tramways Co., Montreal, born there, Mar. 22, 1865.

C. A. Hayes, Freight Traffic Manager, G.T.R., Montreal, born at West Springfield, Mass., Mar. 10, 1865.

H. T. Hazen, Chief Engineer, Duluth, Winnipeg and Pacific Ry., and District Engineer of Construction, Canadian Northern Ontario Ry., Port Arthur, Ont., born at Truro, N.S., Mar. 14, 1870.

Joseph Hobson, M. Can. Soc. C.E., Consulting Engineer, G.T.R., Hamilton, Ont., born at Guelph, Ont., Mar. 1834.

N. J. Holden, President, The Holden Co., Ltd., Montreal, born at Nobelton, Ont., Mar. 22, 1866.

A. R. Holtby, Master of Bridges and Buildings, Mountain Division, G.T.P.R., Prince Rupert, B.C., born at Rawdon, Que., Mar. 23, 1859.

Frank Lee, M. Can. Soc. C.E., Division Engineer, C.P.R., Winnipeg, born at Chicago, Ill., Mar. 7, 1873.

R. W. Long, Division Freight Agent, G.T.R., Hamilton, Ont., born at Appin, Ont., Mar. 20, 1873.

T. W. Lowe, General Boiler Inspector, C.P.R. Western Lines, Winnipeg, born at Montreal, Mar. 30, 1858.

J. M. McKay, Trainmaster, C.P.R., Winnipeg, born at Tiverton, Ont., Mar. 13, 1868.

Owen McKay, M. Can. Soc. C.E., Chief Engineer, Essex Terminal Ry., Walkerville, Ont., born in Ross tp., Renfrew co., Ont., Mar. 13, 1848.

Col. H. H. McLean, K.C., M.P., Vice President, St. John Ry., St. John, N.B., born at Fredericton, N.B., Mar. 22, 1855.

Sir Donald D. Mann, Vice President, Mackenzie, Mann & Co., Ltd., and First Vice President, Canadian Northern Ry.,

Toronto, born at Acton, Ont., Mar. 23, 1853.

D. J. Murphy, Jr., Superintendent of Transportation, Dominion Atlantic Ry., Kentville, N.S., born at Caledonia, Ont., Mar. 3, 1874.

R. Patterson, Master Mechanic, G.T.R., Stratford, Ont., born at Brantford, Ont., Mar. 13, 1860.

F. W. Peters, Assistant to Vice President, C.P.R., Winnipeg, born Mar. 25, 1860.

E. H. Sewell, City Passenger Agent, C.P.R., Sherbrooke, Que., born at Quebec, Mar. 17, 1875.

C. J. Smith, General Manager, Richelieu and Ontario Navigation Co., Montreal, born at Hamilton, Ont., Mar. 10, 1862.

G. Somerville, agent, Merchants Line Steamers, Toronto, born at Kingston, Ont., Mar. 21, 1855.

W. Y. Soper, director, Ottawa Electric Ry. Co., Ottawa, Ont., born at Oldtown, Me., Mar. 9, 1854.

W. C. Starke, Travelling Car Service Agent, G.T.R., Montreal, born there, Mar. 9, 1867.

W. F. Tye, President, Canadian Society of Civil Engineers, ex-Chief Engineer, C.P.R., consulting engineer, Toronto, born at Haysville, Ont., Mar. 5, 1861.

G. W. Vaux, Canadian Passenger Agent, Union Pacific Rd., Toronto, born at Montreal, Mar. 21, 1866.

A. T. Weldon, General Freight and Passenger Agent, Black Diamond Steamship Line, Montreal, born at Dorchester, N.B., Mar. 6, 1876.

D. O. Wood, General Freight Agent for Ontario, Allan Line Steamships, Toronto, born at Kleinburg, Ont., Mar. 16, 1864.

Dominion Government Aid to the Grand Trunk Pacific Railway.

A resolution was passed by the House of Commons Feb. 2 authorizing the payment out of the consolidated revenue fund such sums as may be sufficient to discharge the obligations of the Dominion to the Grand Trunk Pacific Ry. Co. under the provisions of par. 5 of the schedule attached to chap. 54 of the statutes of 1904, in accordance with the interpretation of the paragraph by the judgment of the Imperial Privy Council, Nov. 2, 1911. The Minister of Finance, in moving the resolution, stated that the agreement between the Government and the G.T.P. Ry. was made July 29, 1903, and under it the Government was to guarantee the company's bonds up to \$13,000 a mile for the prairie section, and \$30,000 a mile for the mountain section, the rate of interest to be 3%; the G.T.R. to guarantee the bonds to the extent of the remaining 25%. A supplementary agreement was made in the following year, under which the guarantee of the bonds in respect of the mountain section was to be 75% of the actual cost, and the guarantee in respect of the bonds of the prairie section 75% of the cost, but not to an amount in excess of \$13,000 a mile, and paragraph 5 of the agreement, which was attached as a schedule to the Act of 1904, contained the words: "the Government may and shall . . . implement . . . its guarantee." In 1905 a trust mortgage was executed over the entire line from Winnipeg to Prince Rupert, securing a bond issue of £14,000,000 of bonds to be guaranteed by the Government.

A difference arose between the company and the Government as to the meaning to be placed on the words implementing the guarantee. The Government contended that the words mean that the G.T.P. Ry. would issue its bonds to an amount which would realize \$13,000 a mile on the prairie section, and pay for the amount of bonds required to pay

75% on the cost of the mountain section. The company contended that the Dominion should implement or make up the difference between the net selling price of the bonds, and par, and that there was no obligation on it to issue its bonds further than to the amount of \$13,000 a mile for the prairie section or of 75% of the cost of the mountain section, no matter what they realized. The case went to the courts and the judgment of the Privy Council sustained the company and reversed the decision of the Supreme Court. A memorandum had been prepared showing the liability of the Dominion to the company under this judgment. In 1905 there were sold £3,200,000 of bonds at 92½; in 1909, there were sold £2,000,000 of bonds at 80, and in 1910, a further £2,000,000 of bonds at £80 3s. 9d. In respect of these bonds the Dominion has to pay under the judgment \$4,900,000. On the basis of the estimated cost of the construction of the mountain section as made by the consulting engineer for the Government, there are yet unsold £5,515,220 of these bonds to make up the 75 per cent. upon which there is the Government guarantee, and upon which the Government will be called upon to make up in cash whatever difference there may be between the total amount issued and the amount realized for them.

A bill giving effect to this resolution was subsequently introduced in the House of Commons.

The Making of a Great Canadian Railway is the title of a volume of 350 pages by F. A. Talbot, published by Seeley, Service and Co., London, Eng., and by the Musson Book Co., Toronto. The great Canadian railway referred to is the National Transcontinental, which is being built by the Dominion Government between Moncton, N.B., and Winnipeg, and by the Grand Trunk Pacific Ry. between Winnipeg and the Pacific coast, and which will be operated by the G.T.P.R. In the opening chapter, which deals with the birth of the project, reference is made to the coming to Canada as General Manager of the G.T.R. of C. M. Hays, who is now President, both of the G.T.R. and the G.T.P.R., and by a most unaccountable error it is stated Mr. Hays "first set foot in Canada in 1899," and again "His mission to Canada in 1899 was somewhat curious." As a fact, Mr. Hays was appointed General Manager of the G.T.R. in 1896, following the reconstruction of the company under the presidency of Sir C. Rivers Wilson. The various chapters deal with the making of surveys, and the work of construction from end to end of the line, and are filled with stories of adventure by mountain, field and flood, of difficulties faced and conquered, and of the wonderful development that has sprung up in the country as section after section of the line was built and opened for traffic. The romance rather than the science of the work is dealt with and a very interesting and readable book has been written. Mr. Talbot spent the greater part of 1910 in going over the route gathering the materials for the book, which is embellished by 43 illustrations made from photographs. The price of the volume is \$2.50.

The Dominion Transfer Co. has been incorporated under the Manitoba Companies Act to transport by land or water or through the air by means of vehicles, cars, ships or other methods, and whether propelled by horse, gas, steam, electricity or other power, passengers, goods, wares and merchandise of all sorts and descriptions, both within and without the province of Manitoba, and to charge and collect therefor, and other incidental business. The capital is fixed at \$50,000; the office is at Winnipeg, and the following are provisional directors:—A. T. Bowes, J. A. Dack, C. Dowling, Winnipeg, and Jos. Wood, Brandon.

The Mond Nickel Company's Railway.

The Mond Nickel Co., which has for some years been located at Victoria Mines, Ont., on the C.P.R. Sault Ste. Marie branch, where it operates a smelter plant, is building a large and more extensive smelter, with all the accessories, about eight miles east of Sudbury, where the company has secured a tract of land most advantageously situated, lying in the triangle bounded by the C.P.R. main line, the C.P.R. Toronto-Montreal line, and the Canadian Northern Ry. The natural physical shape of the property has been most carefully taken advantage of in locating the different portions of the plant, giving great facilities for obtaining and handling the ore from the mines until the products leave for market. The shape of the ground affords a site for smelter, ore bins, rock houses, slag dump, track scales, shops, etc., where the ore can be handled at a minimum of cost.

The company built last year a standard gauge railway laid with 80 lb. rails, connecting the C.P.R. and the Canadian Northern Ry., running cars, its property, with spur lines and switchbacks reaching every part of the plant. The grading and bridging work is on C.P.R. specifications, cuttings 22 ft. wide, embankments 16 ft. Curvature and gradients are as light as can be secured in reaching the various elevations of the different part of the plant, and the lines were located after exhaustive surveys. The roasting yards are situated on a level bench adjoining the Canadian Northern Ry., branching off from two parallel sidings on the company's main line, where it leaves the C.N.R. The yard is half a mile long by 350 ft. wide, with six tracks in pairs and three beds.

The property is all timbered, which gives the necessary fuel sufficient to last a long time. At the junction with the C.P.R. the latter company has laid long sidings, and is building a station with loading platform, etc. Water supply for the smelter works is obtained from the Wanapitei River, where the company has installed a pump house and laid a pipe line of about two miles to the works. The electrical power is obtained from the Wanapitei Light and Power Co., whose plant is situated a short distance from the junction of the Mond Nickel Co.'s main line with the C.P.R.

During the past summer all the railway sidings, amounting to about 10 miles, were completed by Angus Sinclair, C.E., contractor, and at present the smelter building of concrete is being built, the work being carried on successfully during the winter months by the use of hot water for cement.

The whole work is under the charge of C. V. Corless, Manager of the Victoria Mine, and J. F. Robertson, Chief Engineer for the company, and it is expected the new plant will be in operation towards the end of this year.

A Mallet Locomotive of large size recently built for the Pennsylvania Rd. by the American Locomotive Co., has the special feature of being a simple instead of a compound engine. It has 16 driving wheels of 56 ins. diameter, which are arranged in two groups, with a pair of 27 x 28-in. cylinders to each group. The weight of engine and tender is about 335 tons, which is 136 tons heavier than the largest freight engines now in service on this road. The total heating surface is 7723 sq. ft., and the steam pressure is only 160 lb. The total length over engine and tender is 98 ft. 4 in. The locomotive has been built largely as an experiment, and will be tried in freight service on the steep grades of the line in western Pennsylvania.

Uniform Specifications for Railway Roadbed and Ballasting.

At the Canadian Society of Civil Engineers' annual meeting in Montreal recently a report was submitted from the committee on roadbed and ballasting, of which J. G. Sullivan, Chief Engineer, Western Lines, C.P.R., is chairman, recommending for consideration specifications under the following headings:—General, clearing, grubbing, grading, excavations and embankments, borrow pits, side ditches, etc., classification, price and measurement of grading, alternate optional overhaul clause, foundations, tunnel excavations, timber structures, piling, sheet piling, frame trestles, log and timber culverts, concrete culverts and culvert pipes, rip-rapping, paving, revision of existing line or widening for additional track, track, general provisions and conditions.

W. B. Mackenzie, Chief Engineer, Intercolonial Ry., said he heard nothing of the proposed specifications until about a month before the meeting. He spent a couple of days going over it and sent a memo of his views on certain portions to the chairman of the committee, but the report had been presented as originally prepared, without any change. He expressed himself in favor of the Association adopting standard specifications and proceeded to discuss the specifications as submitted in detail, pointing out numerous paragraphs which he thought should be revised.

After considerable discussion by other members, including G. A. Mountain, Chief Engineer, Board of Railway Commissioners; S. B. Clement, Chief Engineer, Temiskaming and Northern Ontario Ry.; G. H. Duggan, Chief Engineer, Dominion Bridge Co., and others, and the proposal of a motion and several amendments it was decided to refer the report to the society's various branches for discussion and report, that members who cannot attend the meetings be asked to send in their opinions or suggestions by March 1; that the committee consider the same and ask for a letter ballot of the members on the final report by June 1.

Telephone Train Dispatching on the Canadian Pacific Railway.

In our January issue we gave complete details of the C.P.R. telephone train dispatching circuits, showing a total of 3,932 miles so equipped, with 516 stations. We are officially advised that appropriations have been made for the equipment of the following additional circuits:—

	Miles.
Kamloops to North Bend, B.C.	121
North Bend to Vancouver, B.C.	129
Medicine Hat to Lethbridge, Alta.	116
Moose Jaw to North Portal, Sask.	167
Guelph Jct., Goderich and Listowel Branch, Ont.	112
Grand Mere and St. Gabriel branch, Que. ...	56

Total 701

The following equipment will be used on the different sections:—

Between Vancouver and Kamloops, selector and Kellogg telephone equipment.

Medicine Hat to Lethbridge, Gill selector and Northern Electric & Mfg. Co.'s telephone equipment.

Moose Jaw to North Portal, Sandwich selector and Kellogg telephone equipment.

Goderich and Listowel branches, Gill selector and Northern Electric and Mfg. Co.'s telephone equipment.

Grand Mere and St. Gabriel branches, Gill selector and Northern Electric and Mfg. Co.'s telephone equipment.

Railways and Canals Department's Expenditures, Etc.

The total expenditure of the Railways and Canals Department for the year ended Dec. 31, 1911, was \$40,180,326.81, of which \$2,369.52 was expenditure common to both branches. The total income was \$10,470,532.87. The total expenditure on railways and canals prior to and since Confederation is \$606,502,600.32, of which \$812,727.84 is on general account common to both branches. The total revenues collected are \$171,784,079.86.

The total railway expenditure for the year was \$36,301,979.24, of which \$24,760,029.58 was charged to capital, \$1,503,070.89 to income, and \$10,038,878.77 to revenue. The expenditure on capital account included \$23,488,208.40 for the eastern division of the National Transcontinental Ry.; \$184,149.81 for the railway to Hudson Bay, and \$227,563.40 for the Quebec bridge. The income account included \$1,284,892.04 paid as subsidies to railways; \$164,392.32 for the Board of Railway Commissioners, and \$21,619.34 for inspection of the Grand Trunk Pacific Ry.

The expenditure on the Intercolonial Ry. included the working expenses of \$9,595,976.79 charged to revenue account, and \$762,869.06 charged to capital account; while \$17,797.98 was charged to revenue account for the maintenance of the Windsor branch. Of the expenditure on the Prince Edward Island Ry., \$424,104 was charged to revenue account and \$94,320.56 to capital account.

The total expenditure prior to and since Confederation amounts to \$261,414,694.87 on capital account; \$214,073,844.19 covering the operation of the Government lines; \$42,735,008.32 subsidies to railways other than the C.P.R. main line, making a total of \$475,489,401.56. The expenditure prior to Confederation amounted to \$13,881,460.65 on portions of what is now the Intercolonial Ry. and the Prince Edward Island Ry.

The total expenditure on canals for the year was \$3,875,978.05, of which \$2,349,474.49 was charged to capital account; \$440,269.03 to income account; \$595,894.79 for staff and \$490,339.74 for repairs, these two amounts being charged to revenue account. Since June 22, 1905, when the tolls for the passage of vessels and goods along the canals were abolished, the revenues for the canal branch have arisen from hydraulic rents and miscellaneous sources. The amount received during the year was \$221,138.49, of which \$187,908.53 accrued from hydraulic rents. The total expenditure on canals prior to and since Confederation amounts to \$99,331,923.86 on capital account, and \$30,868,547.06 from the consolidated funds for operation, maintenance and repairs. The expenditure prior to Confederation was \$20,593,866.13. The total revenue collected amounts to \$14,377,492.63.

Canadian Northern Ry. Tie Preservation.—A press report recently stated that at the plant which is being established at Fort Frances, Ont., for treating Canadian Northern Ry. ties, poplar ties were to be treated instead of those of other woods usually used. We are officially advised that this is incorrect, as ties made from all woods in the vicinity of the Rainy River will be treated, including pitch pine, red pine or Norway, and tamarack, also probably some spruce.

Toronto Mail and Empire—"Fifty millions for railway extensions in the Canadian West this year! That is equivalent to \$25 for every inhabitant. It is not surprising that the West experiences a few growing pains."

Orders by the Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers, are those on which the hearing took place, and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

15815. Jan. 19.—Extending to Mar. 1 time for execution of commissions and for report to the Board in connection with examination of witnesses in Dawson Board of Trade vs. White Pass and Yukon Route, as provided by order 15719, Jan. 2.

15816. Jan. 17.—Authorizing G.T.P. Branch Lines Co. to build spur from its Mountain Park coal branch for Yellowhead Pass Coal and Coke Co., Alberta.

15817. Jan. 18.—Approving C.N.O.R. location through Springer, Field, Badgerow, Gibbons and Crerar tps., Nipissing district, mileage 366 to 386 from Montreal.

15818. Jan. 18.—Authorizing town of Leamington, Ont., to carry street over M.C.R. right of way.

15819. Jan. 18.—General order re less than carload freight to be carried in heated cars. This order is given in full on another page.

15820. Jan. 20.—Amending order 15741, Jan. 3, by providing that C.P.R. install cover plates where tracks pass through the sidewalk, in connection with spur for Swift Canadian Co., Winnipeg.

15821. Jan. 19.—Approving Maine Central Rd. bylaw authorizing W. K. Sanderson, G.F.A., H. D. Waldron, G.P.A., and F. S. Davis, Chief of Train Bureau, to issue tariffs.

15822. Jan. 18.—Authorizing International Bridge and Terminal Co. to build its bridge and railway across Church St., Fort Frances, Ont., crossing to be protected by gates.

15823. Jan. 19.—Authorizing C.P.R. to build its Lacombe Easterly branch of Calgary and Edmonton Ry. across 10 highways, divert same, and close up portions of diversions, mileage 129.47 to 139.22, Alta.

15824. Jan. 20.—Authorizing Vancouver, Victoria and Eastern Ry. (G.N.R.) to build portion of tram track on Front St., Vancouver, B.C.

15825. Jan. 19.—Approving location of C.P.R. station at Fitzhugh, Alta.

15826. Jan. 22.—Approving location of C.N.O.R. station grounds at Portland, Ont.

15827. Jan. 20.—Authorizing C.N.O.R. to cross public road on lot 8, between cons. 2 and 3, Dorion tp., Thunder Bay District.

15828. Jan. 23.—Authorizing Brooke tp., Ont., to build McDougall drain under Canada Southern Ry.

15829. Jan. 23.—Approving location of C.N.O.R. station grounds at Dwyer Hill.

15830. Jan. 24.—Extending to Feb. 15, time for erection of gates by G.T.K. at John St., Toronto.

15831. Jan. 24.—Extending to June 30 time for building subway at Elizabeth St., West Toronto, Ont.

15832. Jan. 24.—Authorizing city of Strathcona, Alta., to build level crossing over Calgary and Edmonton Ry. (C.P.R.) at Third Ave North.

15833. Jan. 24.—Authorizing C.P.R. to divert highway between secs. 9 and 4, Naples station, mileage 85.3, Nipinka subdivision.

15834 to 15836. Jan. 24.—Dismissing applications of city of Strathcona, Alta., for level crossings over Calgary and Edmonton Ry. (C.P.R.) at three points.

15837. Jan. 25.—Approving C.P.R. proposed addition to bridge and change of grade across Mountain St., Montreal.

15838. Jan. 24.—Authorizing G.T.R. to rebuild swing bridge over Rideau canal at Ottawa.

15839. Jan. 24.—Relieving G.T.R. from further protection at Adelaide St., Mount Bridges, Ont.

15840. Jan. 24.—Authorizing British Columbia Government to build highway crossing over C.P.R. one mile north of Okanagan Landing.

15841, 15842. Jan. 23.—Authorizing C.N.O.R. to cross public road in lot 8, between cons. 1 and G, Medora tp., Muskoka District, and to cross Jane St., York tp., and build bridge to carry highway over track.

15843. Jan. 23.—Extending to Apr. 9, time for installation of bell by C.P.R. near St. Basile, Que.

15844. Jan. 27.—Disallowing G.T.R. and C.P.R. tariffs on rope, etc., until further order.

15845. Jan. 26.—Authorizing C.P.R. to build its Pheasant Hills branch across 31 highways, mileage 202.00 to 252.92, Man.

15846. Jan. 27.—Adding Halton county as party to application of Nelson tp. for protection of G.T.R. Plains Road crossing west of Burlington Jct., Ont.

15847. Jan. 25.—Authorizing G.T.R. to rebuild bridge 236 over Chateaugay River, mileage 43.82, at Brysons, Que.

15848. Jan. 25.—Amending order 15498, Nov. 28, 1911, re C.P.R. spur to ballast pit at Elson, Alta.

15849, 15850. Jan. 25.—Authorizing C.P.R. to build spurs for Redcliffe Realty Co., Redcliffe Brick and Coal Co., and Quinlan Carter Co. in Alberta.

15851. Jan. 25.—Ordering C.N.R. within six weeks to provide farm undercrossing for A. J. Hunter, Sleeman, Ont.

15852. Jan. 25.—Approving plans of Mordean drain to be built under M.C.R. in Aldborough tp., Ont.

15853. Jan. 31.—Amending order 15802, Jan. 11, re Canadian Copper Co.'s spur.

15854. Jan. 31.—Naming express collection and delivery limits for Magog, Que.

15855. Feb. 8.—Extending for three weeks time for filing plans for C.P.R. interlocker at Woodstock, Ont., as required by order 15451, Nov. 7, 1911.

15856. Jan. 31.—Authorizing Smart Turner Machine Co. to erect travelling crane across G.T.R. siding at Hamilton, Ont.

15857. Jan. 31.—Ordering that cost of gates at M.C.R. crossing east of Welland station, Ont., as provided by order 10668, Feb. 20, 1910, be borne, 15% by town of Welland, 10% by Crowland tp., and remainder by M.C.R.

15858. Feb. 1.—Disallowing Supplement 1 to Boston and Maine Rd. joint and proportional class rate and commodity tariff C.R.C. 1219.

15859. Feb. 1.—Authorizing T.H. and B.R. to build siding for Armstrong Supply Co., Hamilton, Ont., and rescinding order 15145, Jan. 23.

15860. Jan. 31.—Approving revised location of G.T.P. Branch Lines Co. Cutknife Branch, mileage 31.86 to 53.84, Sask.

15861. Jan. 31.—Ordering that town of Simcoe, Ont., pay G.T.R. 15% of cost of protection of crossing at Norfolk St., required by order 15387, Nov. 15, 1911.

15862. Feb. 1.—Authorizing G.T.R. to build siding for Watrous Engine Works, Brantford, Ont., and rescinding order 15255, Oct. 11, 1911.

15863. Feb. 2.—Authorizing G.T.R. to rebuild swing bridge over Richeileu River, mileage 8.15, District 13, Que.

15864, 15865. Feb. 1.—Authorizing C.P.R. to open for traffic its Moose Jaw Southwestern branch from near Moose Jaw, to mileage 27.4, and its Swift Current Southeastern branch from near Swift Current to Neville, Sask., mileage 27.4, speed of trains limited to 15 miles an hour.

15866. Feb. 1.—Authorizing T.H. and B.R. to cross at grade Newport St., Brantford, Ont.

15867 to 15869. Jan. 29, Feb. 1.—Approving C.N.R. location through tps. 10-11, r. 3-4, mileage 69.78 to 77.27; through tp. 11, r. 26-30, w. 3 m., Sask., mileage 25.38 to 51.08; and through tps. 5-6, r. 26-28, w. 4 m., Alta., mileage 120.27 to 141.09.

15870. Feb. 1.—Approving location of C.N.O.R. station grounds at Richmond.

15871, 15872. Jan. 27, 29.—Authorizing C.N.R. to cross 13 highways with its Calgary southerly line, Alta., and 10 highways on its Swift Current line, Sask.

15873. Jan. 30.—Authorizing C.P.R. and Montreal St. Ry. to use crossing at Papineau Ave., Montreal, without coming to stop, interlocker being completed.

15874, 15875. Jan. 27, 31.—Authorizing C.P.R. to build spurs for McGillivray Creek Coal and Coke Co., near Coleman, Alta., and for Nicola Valley Pine Lumber Co., near Canford, B.C.

15876. Jan. 30.—Authorizing C.N.R. to open for traffic its Rosburn extension from hamton to the main line east of Canora, 15 miles, Sask.

15877. Feb. 1.—Approving location of C.N.O.R. station grounds at Newburgh.

15878, 15879. Jan. 27.—Approving C.N.R. location through tps. 9-6, r. 25, mileage 106.37 to 120.27, and tp. 52, r. 24, w. 4 m., mileage 44.40 to 45.97, Alta.

15880, 15881. Jan. 31, 29.—Authorizing C.N.R. to cross with its Grosse Isle branch 15 highways and 9 highways in Woodlands and Rockwood rural municipalities, Man., respectively.

15882. Jan. 26.—Authorizing C.N. Pacific Ry. to use C.P.R. Mission branch crossing for construction purposes only until June 30, under condition that all trains be brought to a stop, subject to terms of order 14577.

15883. Jan. 27.—Approving location of C.P.R. standard portable station on Yahk branch, 5 miles north of Kingsgate, B.C.

15884. Jan. 27.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to build farm crossing, mileage 25, lot 3, con. 6, South Orillia tp., Ont.

15885. Feb. 1.—Relieving C.P.R. from further protection at crossing in Blind River, Ont.

15886, 15887. Feb. 1.—Approving change in location of C.P.R. stations at Ste. Rose and St. Martin Jct., Que.

15888. Feb. 2.—Authorizing C.P.R. to build spur for Construction and Paving Co., North Toronto, Ont.

15889, 15890. Jan. 30.—Authorizing C.P.R. to use bridge over Scugog River, near Lindsay, and to use 10 bridges between mileage 20.64 and 81.13, all on Georgian Bay and Seaboard Ry., Ont.

15891. Jan. 30.—Authorizing C.P.R. to operate trains under bridge 4.37, Walkerton subdivision, Ont.

15892. Jan. 27.—Authorizing C.P.R. and G.T.P.R. to use crossing in s.w. ¼ sec. 33, tp. 34, r. 27, w. 2 m., Sask., interlocker being completed.

15893. Jan. 27.—Certifying correction to G.T.P. Branch Lines Co.'s location plan of its Toftield-Calgary branch.

15894. Jan. 29.—Authorizing G.T.P. Branch Lines Co. and C.N.R. to use interlocking plant at crossing in n.e. ¼ sec. 20, tp. 38, r. 26, w. 2 m., at Dana, Sask.

15895. Jan. 29.—Ordering Pere Marquette Rd. to erect fences in middle part of lot 14, con. 2, Colchester South, Ont.

15896. Jan. 31.—Authorizing Gloucester tp., Ont., to continue Queen Mary St. over C.P.R.

15897. Feb. 2.—Authorizing C.P.R. to open for traffic its second track from Romford Jct. to Crete, Ont.

15898. Feb. 3.—Approving Lake Erie and Northern Ry. location from Grand River, Brantford, to Port Dover, Ont.

15899, 15900. Feb. 1.—Approving standard clearance of G.T.P.R. coal chutes, also for ice house on side tracks.

15901. Jan. 1.—Relieving C.N.R. from further protection of crossing between mileposts 475 and 476, east of Aberdeen, Sask.

15902. Jan. 30.—Amending order 15692, Dec. 27, 1911, by providing that bell at C.P.R. crossing, 1¼ miles east of Ivanhoe station, Ont., be installed before June 29.

15903. Feb. 5.—Extending to Mar. 15 time for installation by G.T.R. of interlocking plant at C.P.R. crossing, Nipissing Jct., Ont., to connection with T. and N.O.R.

15904. Feb. 6.—Approving C.N.O.R. revised location through Loughborough tp., mileage 164.59 to 164.76.

15905, 15906. Jan. 27.—Authorizing C.N.R. to cross two public roads on its Grosse Isle branch, Rockwood rural municipality, Man.

15907. Feb. 5.—Authorizing C.N.R. to cross with its Strathcona-Camrose branch, seven highways in Alberta.

15908. Feb. 6.—Further extending to June 30 time for Hull Electric Co. to complete equipment of cars with power brakes, as required by order 10462, May 3, 1910.

15909. Feb. 6.—Authorizing C.N.R. to build spur on its Vegreville-Calgary line for Rose Deer Coal Mining Co.

15910. Feb. 7.—Amending order 15709, Dec. 29, 1911, by authorizing C.P.R. to build three spurs, instead of two, for Imperial Oil Co., Winnipeg.

15911. Feb. 5.—Authorizing C.P.R. to build across and divert highway at mileage 210.03 at west boundary of sec. 18, tp. 18, r. 16, w. 3 m., Sask.

15912. Feb. 7.—Authorizing C.P.R. to build spur for Saskatchewan Flour Mills Co., Moose Jaw.

15913. Feb. 6.—Amending order 15816, Jan. 17, re G.T.P.R. spur for Yellowhead Pass Coal and Coke Co.

15914. Feb. 6.—Authorizing V.V.E.R. and N. Co. and Vancouver, Fraser Valley and Southern Ry. to use crossing near Ardley, B.C., interlocker being completed.

15915. Feb. 5.—Dismissing application of city of St. Thomas, Ont., to continue Inker-man St. across G.T.R.

15916. Feb. 5.—Removing speed limitation on G.T.P.R. Yorkton branch from Melville to Canora, Sask.

15917. Feb. 8.—Extending to June 1, time for installation of interlocking plant by C.N.R. at C.P.R. crossing near Forward, Sask.

15918. Feb. 8.—Approving location of C.N.R. station at Clyde, Alta.

15919. Feb. 8.—Authorizing C.P.R. to divert streams by 8 ft. concrete culvert at mileage 110.1, Cascade subdivision, B.C.

15920, 15921. Feb. 8.—Authorizing G.T.R. to rebuild bridges over Mud River at milepost 4.87, Rockland branch and, and at milepost 8.06, Hawkesbury branch, Ont.

15922. Feb. 8.—Relieving C.P.R. from erecting fences, gates and cattle guards, on Laggan subdivision, B.C.

15923. Feb. 6.—Authorizing village of Luseland, Sask., to build highway across C.P.R. at mileage 15.95.

15924. Feb. 10.—Authorizing C.P.R. to use five bridges on its Havelock and Toronto subdivision, Ont.

15925. Feb. 10.—Authorizing Lake Erie and Detroit River Ry. (P.M.R.) to remove derrails and signals from connection with C.P.R.; and re-arrange interlocking in tower so that towerman can give freight trains a through route to and from the C.P.R. Windsor yard, Ont.

15926. Feb. 5.—Approving Lake Erie and Northern Ry. overhead crossing of T.H. & B. R. and M.C.R. at Waterford, Ont.

15927. Feb. 6.—Authorizing Lachine, Jacques Cartier and Maisonneuve Ry. (G.T.R.) to cross C.P.R. in Montreal, at entrance to Angus shops and near Nolan St., and to take C.P.R. lands. C.P.R. to re-arrange its spurs into Angus shops, compensation to be fixed by agreement.

15928. Feb. 12.—Rescinding order 15254, Oct. 11, 1911, re G.T.R. spur near Jex St., Brantford, Ont.

15929. Feb. 12.—Authorizing C.P.R. to cross with its Pheasant Hills branch, 25 highways, mileage 296.11 to 317.15, Sask.

15930. Feb. 10.—Authorizing C.N.R. to cross with its Calgary Southerly line, 20 highways in Alberta.

15931. Feb. 13.—Approving Kettle Valley Ry. location from mileage 28 to 52 from Hope, B.C.

15932. Feb. 12.—Authorizing C.P.R. to open for traffic portion of railway near Steel siding, mileage 92 to 95, Thunder Bay District, Ont.

15933. Feb. 13.—Approving location of Algoma Central and Hudson Bay Ry. station at Tagana, Ont.

15934, 15935. Feb. 12.—Authorizing C.P.R. to build spurs for Canadian Lumber Yards, Winnipeg, Man., and Crow's Nest Pass Lumber Co., near Wardner, B.C.

15936. Feb. 12.—Authorizing C.N.O.R. to cross road between cons. 1 and 2, lot 8, South Crosby tp.

15937. Feb. 12.—Dismissing application of Canadian Fraternal Association, for order prohibiting G.T.R., G.T.P.R., C.N.R. and M.C.R. from collecting 25c. from delegates attending conventions for certifying their certificates.

15938. Feb. 6.—Authorizing Lachine, Jacques Cartier and Maisonneuve Ry. (G.T.R.) to cross overhead, Rachael, Hogan, Bercy and Sherbrooke Sts. Montreal.

15939. Feb. 12.—Authorizing C.N.O.R. to cross 11 highways in Markham tp., mileage 14.9 to 25.69 northerly from new union station site, Toronto.

15940. Feb. 13.—Authorizing C.N.O.R. to open for freight traffic its line from Belleville to Deseronto, 16½ miles.

15841. Feb. 3.—Authorizing British Columbia Ry. (C.P.R.) to build spur from Waldo branch to Baynes Lake across G.N.R., at mileage 1.4, lot 1899 E.K.D., semaphore protection to be provided.

15942. Feb. 13.—Authorizing N.Y.C. & H.R.R. to rebuild bridge A38 on its Adirondack Division, 0.3 miles north of Athelstan.

15943. Feb. 12.—Approving Edmonton, Dunvegan and British Columbia Ry. location through tps. 53-56, w. 4 m. Alta.

15944 to 15946. Feb. 3, 10.—Authorizing C.P.R. to build spur with three sub-spurs, in Swift Current, Sask.; spur for Frontenac Breweries, Mile End, Que., and spur for D. D. Wood, Winnipeg, Man.

15947. Feb. 12.—General order re rules and regulations for inspection of locomotive boilers, etc.

15948. Feb. 5.—Approving location of G.T.P.R. station site at Stony Plains, Alta.

15949. Feb. 12.—Authorizing G. H. Shaw, G.T.M. Niagara, St. Catharines and Toronto Ry. to prepare and issue tariffs of tolls.

15950. Feb. 8.—Ordering C.P.R. before July 1 to install electric bells at crossing in Coldwater, Ont., 20% to be paid from railway grade crossing fund.

15951, 15952. Feb. 12.—Authorizing C.N.O.R. to cross Ford St., Toronto, and Toronto Suburban Ry., overhead, and to cross seven highways in Etobicoke tp.

15953. Feb. 12.—Ordering Bell Telephone Co. to amend supplement 42, C.R.C. 1708, and providing certain changes in rates to subscribers between Toronto city and island.

15954. Feb. 9.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to cross St. Patrick and Dermot Sts., Ops tp., Ont., at mileage 72.21, and to take certain lands of W. B. Fee for road diversion.

15955. Feb. 6.—Approving location of C.N.O.R. station at Brockville Jct.

15956. Feb. 12.—Ordering Grand Valley Ry. Co. to pay T.H. & B.R. \$200 for old diamond at crossing on South Market St., Brantford, Ont.

15957. Feb. 9.—Authorizing C.P.R. to cross with its double track, McTavish St., Fort William, Ont.

15958, 15959. Feb. 9.—Authorizing C.N.O.R. to connect with G.T.R. at Cobourg, and to cross Russell Road, at Junction Gore.

15960. Feb. 14.—Ordering that G.T.R. crossing near Kettle Creek Bridge, St. Thomas, Ont., be protected day and night by watchmen, 15% to be paid by Yarmouth tp., and 15% by city of St. Thomas.

15961. Feb. 15.—General order re freight rates, west of Port Arthur, adding British Columbia to enquiry.

15962. Feb. 15.—Ordering G.T.R. to install within 90 days, electric bell at crossing of Grande Ile Ave., Valleyfield, Que.

15963, 15964. Feb. 14.—Correcting errors in G.T.P. Branch Lines Co.'s location of Biggar-Calgary branch.

15965. Feb. 12.—Relieving C.P.R. from erecting fences, gates, and cattle guards on portions of Atlantic, Eastern Ontario and Lake Superior Divisions.

15966. Feb. 15.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to use bridges at mileage 20.64, 23.4 and 24.3 at Couchiching Narrows, Ont.

15967. Feb. 3.—Authorizing C.P.R. to build spur for A. Bowerman, Saskatoon, Sask.

15968. an. 31.—Authorizing C.N.R. to cross with its Grosse Isle branch, 12 highways in Woodlands municipality, Man.

15969. Feb. 13.—Amending order 15667, Dec. 15, 1911, by substituting new plans re spur for St. Marys Portland Cement Co. and Horse Shoe Quarry, Blanchard tp., Ont.

15970. Feb. 15.—Extending to July 1, time for completion of C.N.R. spur in Hudson Bay Reserve, Edmonton, Alta.

15971. Feb. 15.—Approving coal chute clearances of G.T.P.R.

15972. Feb. 14.—Authorizing Edmonton, Dunvegan and British Columbia Ry. to cross highways from mileage 0 to 30, Alta.

15973. Feb. 15.—Adding Bentinck tp., Ont., to application re protection of Walkerton and Lucknow Ry. (C.P.R.) crossing.

15974. Feb. 14.—Approving new plan and rescinding order 14066, June 24, 1911, which approved plan for installation of block signals by T.H. & B.R. between Hamilton and Vine-mont, Ont.

15975. Feb. 15.—Correcting errors in G.T.P. Branch Lines Co.'s location plan of its Biggar-Calgary branch.

15976. Feb. 16.—Regulating connection between G.T.R. and C.P.R. trains at Brockville, Ont.

15977. Feb. 15.—Approving location of C.N.O.R. station grounds at St. Joseph, Que.

15978. Feb. 14.—Authorizing C.N.O.R. to cross C.P.R. overhead, on lot 11, con. 2, Nepean tp.

15979. Feb. 16.—Correcting errors in G.T.P. Branch Lines Co.'s location of its Biggar-Calgary branch.

15980. Feb. 15.—Authorizing C.N.R. to build spur to Round Hill Collieries, Alta.

15981. Feb. 16.—Approving T.H. & B.R. bylaw authorizing F. F. Backus, G.F. & P.A., and G. C. Martin, A.G.F. & P.A., to prepare and issue tariffs of tolls.

15982. Feb. 14.—Authorizing York tp., Ont., to build bridge over G.T.R. belt line, east of Yonge St., Toronto, and to open up new highway.

15983. Feb. 15.—Authorizing G.T.P.R. to operate spur for P. Burns & Co., Edmonton, Alta.

15984, 15985. Feb. 16.—Approving revised location of C.P.R. Virden-McAuley branch from mileage 14 to 36.27, Man. and Sask., and revised location of Kerrobert northeasterly branch from mileage 0 to 20.2, Sask.

15986. Feb. 16.—Authorizing C.N.O.R. to cross three highways in Nepean tp.

15987. Feb. 16.—Rescinding order 14379, July 22, 1911, and authorizing C.P.R. to divert public road between cons. 7 and 8, Eldon tp., and to cross diversion at mileage 56.4, by overhead bridge, also to compensate J. McArthur for any damages sustained by close-highway.

15988. Feb. 17.—General order re ash pans on locomotives.

15989. Feb. 16.—Authorizing G.T.P.R. to cross C.N.R. with its second track at Empire Ave., Fort William, Ont.

15990. Feb. 15.—Authorizing C.P.R. to build spur for Manitoba Bridge and Iron Works, at Higgins Ave., Winnipeg.

15991. Feb. 16.—Approving revised location of James Bay and Eastern Ry. (C.N.R.) through Demeules tp., Que.

15992. Feb. 16.—Ordering C.N.R. under penalty of \$10 a day, to provide farm crossing for E. K. Glidden, Vermilion, Alta., before May 15.

15993. Feb. 15.—Dismissing application of Dominion Sugar Co., Wallaceburg, Ont., re re-adjustment of rates on sugar in carloads from Wallaceburg to Winnipeg and western points.

15994. Feb. 17.—Naming express delivery and collection limits for Kamloops, B.C.

15995. Feb. 16.—General order respecting fireguards.

15996, 15997. Feb. 17.—Approving C.N.R. standard third and second class station plans.

15998. Feb. 6.—Ordering C.P.R. to place a caretaker at Rutter station, between 7 a.m. and 6 p.m. daily, except Sundays.

15999. Feb. 17.—Authorizing Esquimalt and Nanaimo Ry. to build two sidings near Duncans on Vancouver Island for Island Lumber Co.

16000. Feb. 17.—Authorizing C.P.R. to use bridge 4.3 on its Montreal Terminals subdivision, Eastern Division.

16001 to 16003. Feb. 17.—Approving revised locations of James Bay and Eastern Ry. (C.N.R.) through Demeules and Dufferin tps., mileage 24.2 to 24.8, 26.2 to 28.9, and 29.26 to 30.2.

16004. Feb. 15.—Authorizing C.N.O.R. to cross under C.P.R. at Lambton, Ont.

16005. Feb. 16.—Ordering that Toronto tp. pay G.T.R. 20% of cost of watchman at Stave Bank crossing, near Port Credit, Ont.

Regulations for Fireguards in Alberta and Saskatchewan.

The Board of Railway Commissioners passed the following order 15995, Feb. 16, re order 3245, July 4, 1907, respecting fireguards, and the provisions of 8-9 Edward VII., chap. 32, sec. 10. Upon hearing counsel for the Canadian Pacific, Grand Trunk Pacific, and Canadian Northern Railways, as well as perusing applications and suggestions from various persons and public bodies, it is ordered as follows:—

1. Paragraphs 8, 9, 10, 11, 12 and 14 of order 3245 are rescinded.

2. Every railway company subject to the Board's authority, operating a steam railway in Alberta or Saskatchewan, or both, shall, on or before Aug. 1 in each year, construct, along each side of the right of way, and not less than 300 ft. distant from the centre, a fireguard consisting of a plowed strip of land not less than 16 ft. wide.

3. Every railway company shall, between Aug. 1 and Dec. 1 in each year, keep the said fireguards, and each parcel or section of land between them and the railway, free from dead or dry grass, weeds, or other unnecessary combustible matter.

4. Wherever the owner or occupant of land objects to the construction of fireguards, on the ground that it would involve unreasonable loss or damage to property; or where the owner or occupant refuses to allow the construction and maintenance of such guards before the terms and conditions thereof are considered by the Board, pursuant to 8 and 9 Edward VII., chap. 32, sec. 10—the company, in either case, shall at once refer the matter to the Board, giving full particulars thereof, and shall in the meantime refrain from proceeding with the work.

5. No railway company shall permit its employees, agents, or contractors to enter upon land under cultivation to construct fireguards until it has caused to be given to the owner or occupant of such land at least two weeks notice of its intention so to enter.

6. If the agent, employee, or contractor of any railway company leaves gates open, or cuts or leaves fences down whereby stock or crops are injured, or does any other unnecessary damage to property in connection with the construction of fireguards, every such agent, employee, or contractor, shall, in addition to any civil liability for damages, be subject to a penalty of \$25 for every such offence.

7. Every railway company shall have the right to apply to the Board to be relieved from the terms of this order where the nature of the country would render it either impossible or useless to construct such guards.

8. Every railway company disobeying or failing to comply with the provisions of these regulations, shall, in addition to any pecuniary liability for damages, be further liable to a penalty of \$100 for every disobedience or failure.

RAILWAY DEVELOPMENT.

Projected Lines, Surveys, Construction, Betterments, Etc.

Algoma Central and Hudson Bay Ry.—The junction point of this line with the C.P.R. transcontinental line, about a mile from Hobon, Ont., has been named Franz, after the company's Vice President and General Manager. Several bridges have to be built, and 14 miles of track laid to complete the line through from Sault Ste. Marie, via Hawk Lake Jct., where connection is made with the Michipicoten branch, to Hobon, and it is expected that this work will be finished by Aug. Good progress is reported as being made with the line from Hobon to the National Transcontinental Ry., the junction point with which has been named Grant, and is about 130 miles westerly from Cochrane. (Feb., pg. 67.)

Alberta Central Ry.—See Canadian Pacific Ry. Construction, Betterments, etc., on another page.

Alberta Pacific Ry.—The Alberta Legislature has extended the time within which this projected railway may be built. (Jan., pg. 21.)

Ansley Coal Co.—The Medicine Hat, Alta., council has been asked to extend its industrial spur line to the race track to meet a spur proposed to be built from the company's colliery. The new industries committee was asked to report on the matter.

Argenteuil Ry.—Application is being made to the Quebec Legislature to incorporate a company with this title to build a railway on lot 15, 16 or 17 on the boundary between Harrington and Grandville tps., in range 11, to the Grandville canal, in the first range of Grandville tp. Beique, Beique and Beique, Montreal, are solicitors for applicants.

Bagotville and St. Lawrence Ry.—The Quebec Legislature has incorporated a company with this title to build a railway from St. Alphonse or Grand Bay to Murray Bay, Que. The provisional directors are: Mayor Drouin, G. Tanguay, Quebec; A. Lepage, Bagotville, Que.; J. Tremblay, Ste. Anne, Que.; H. Patton, Albany, N.Y. (Feb., pg. 67.)

Burrard Inlet Tunnel and Bridge Co.—The North Vancouver district council has decided to subscribe for an additional \$150,000 of stock in the company, bringing its interest in stock in the company up to \$400,000, and the North Vancouver town council will at its next meeting consider what further amount of stock it will take. The Shipmasters' Association passed a resolution, Feb. 3, favoring the building of a high level instead of a low level bridge with a swing span as proposed. (Jan., pg. 21.)

Calgary and Fernie Ry.—In the bill before the Dominion Parliament to grant an extension of time for the building of this projected railway, it is also provided that the first section of the act of incorporation, passed in 1906, be amended by substituting of the names of J. R. Lawrey, S. S. Manahan, Victoria, B.C., and A. Mutz, Fernie, B.C., for W. R. Ross, J. S. T. Alexander, I. R. Poole, Fernie, and D. McE. Eberts, Victoria. (Dec., 1911, pg. 1137.)

Central Ry. of Canada.—We are officially advised that a preliminary location has been made from Montreal to Midland, Ont., and from the main line at St. Andrews, Que., to Ste. Agathe, Que. Complete surveys and profile and final location have been made from Montreal to South Indian, via St. Eustache, St. Placide, Oka, St. Andrews, Hawkesbury, McAlpin, Lemieux. A large amount of the right of way has been purchased, including that for a terminal in Montreal. Rails and ties have been

ordered for 50 miles. The bridges over Riviere des Prairies, near Montreal, Riviere des Mille Isles, at St. Eustache, and over the Ottawa River at St. Andrews have been commenced. Other construction will be pushed directly weather permits. C. N. Armstrong, Montreal, is Managing Director; F. Stuart Williamson, Montreal, Chief Engineer, and C. J. Wills and Sons, London, Eng., and Montreal, are the contractors.

Chicago, Milwaukee and St. Paul Ry.—A free right of way is reported to have been offered to the company for a line from Fargo to Grand Forks, N.D., the line to be continued from that point to Winnipeg, Man. (Oct., 1911, pg. 935.)

Cochrane and Alberta Ry.—A company with this title has been incorporated by the Alberta Legislature to build a railway from Cochrane to Bonnie Brae coal mine, and thence southerly to the international boundary, about 20 miles. In passing through the house the name of the company was changed from that proposed—the Moose Mountain Ry.—to the C. and A. Ry. Co., and the route was more clearly defined than in the original notice. (See Moose Mountain Ry., Feb., pg. 68.)

Delaware and Hudson Co.—We are officially advised that the Quebec, Montreal and Southern Ry., which, with the Napierville Jct. Ry. form the D. and H. Co.'s lines in Canada, is not building a new bridge over the Yamaska River at Sorel, Que., as stated in press reports. The ice moved one of the piers of the existing bridge in the spring of 1911, and the work being done consists in the tearing down of the old pier, the strengthening of the foundation, and the rebuilding of the pier on the old lines. The only change made has been in the foundation work. F. D. Anthony is Chief Engineer. (Jan., pg. 21.)

Dominion Atlantic Ry.—We are officially advised that the revised location in the vicinity of Allen's Creek, Annapolis, N.S., is being made to secure a better alignment, and for more economical working in connection with the construction of the piers for the new bridge. The present bridge is a wood structure consisting of a Howe truss of 80 ft. span on piers of three braced trestles, each with 39 spans on the east and 20 spans on the west side. The new structure is made up of one 150 ft. through truss steel span with two 80 ft. half deck plate girder flanking spans on concrete piers and abutments. In connection with this there is also to be about 350 ft. of timber trestle, which will afterwards be filled in with earthwork.

Application is being made to the Nova Scotia Legislature to extend the time within which the projected North Mountain extension may be built, in accordance with the conditions prescribed in chap. 156 of the statutes of 1910, and the filing of plans with the Dominion Government. (Feb., pg. 67.)

Dominion Pacific Ry.—The provisional directors named in the application to the Dominion Parliament for the incorporation of a company with this title are:—J. E. Askwith, J. O. Carss, W. R. Askwith, O. E. Culbert, Ottawa; H. McL. McCallum, Regina, Sask. The line proposed to be built would start at the international boundary south of Pincher Creek, Alta., and pass through Calgary and Edmonton to Fort St. John, B.C., with a branch along the Old Man River to the boundary between Alberta and British Columbia. (Dec., 1911, pg. 1137.)

Edmonton, Dunvegan and British Col-

umbia Ry.—In introducing the Alberta Government's legislation for the building of railways in the province, Feb. 6, the Premier said the proposals covered the guaranteeing of the bonds of the E.D. and B.C. Ry. for \$20,000 a mile for 350 miles. This line is to be built by a separate company under an agreement with the G.T. Pacific Ry., satisfactory to both companies, and entered into for the more speedy construction of the line. Construction is to be started at once, 100 miles to be completed by the end of 1912.

Press reports state that J. D. McArthur, of Winnipeg, who controls the charter, has purchased 140 acres west of Bronx, lying east of the St. Albert Road, and 13 acres lying north of the G.T. Pacific tracks for terminal purposes. (Feb., pg. 67.)

Esquimalt and Nanaimo Ry.—The extension of the line to Cowichan Lake, B.C., about 18 miles, is expected to be completed and ready for traffic by May 1. The branch leaves the main line about a mile north of Duncan.

The right of way for the proposed extension from McBride Jct. to Union Bay is being cleared. The work is being prosecuted from the Union Bay end, and was reported to have reached beyond Oyster River, Jan. 31.

Plans have been filed with the Provincial Minister of Railways for an extension of the line now terminating at Port Alberni, by way of Sproat River and Sproat Lake to Great Central Lake. (Feb., pg. 67.)

Glengarry and Stormont Ry.—The Ontario Legislature is being asked to incorporate a company with this title to build a railway from the C.P.R. in Lancaster tp., Glengarry county, near the eastern boundary of the province, southerly and westerly to the St. Lawrence River, then westerly to Cornwall, Ont., with branch lines. C. L. Hervey, civil engineer, is interested in the promotion of the company.

Green Bay to Bay of Islands, Nfld.—The Quebec board of trade has been informed that the Newfoundland Legislature proposes to vote a subsidy of \$75,000 a year to a London, Eng., syndicate, which plans to build a railway from Green Bay to Bay of Islands, Nfld., and to operate a car ferry from the latter point to Gaspé, Que., or Dalhousie, N.B. Green Bay is proposed as the terminus of a fast line of steamships running from England or Ireland.

High River, Saskatchewan and Hudson Bay Ry.—The provisional directors named in the bill now before the Dominion Parliament asking for the incorporation of a company with this title are:—H. N. Sheppard, F. Crandall, T. E. Le Claire, C. A. Glogot, G. T. Stanley, High River, Alta. (Feb., pg. 67.)

Hudson Bay, Peace River and Pacific Ry.—A special general meeting of shareholders has been called to be held in Winnipeg, Mar. 12, to authorize the issue of bonds, debentures and other securities. H. W. Adcock, Winnipeg, is Secretary. (Feb., pg. 67.)

Intercolonial Ry.—In connection with the project to build a branch line from Sunnybrae to Guysborough and Country Harbor, for which a contract was let by the late Government to the Nova Scotia Construction Co., at an estimated cost of \$1,057,122.19, and for which an appropriation of \$1,000,000 was voted in 1911, the Minister of Railways said in the House of Commons Feb. 1:—"Surveys of the whole of the railway had not been completed before tenders were invited. The first location of the line was from Sunnybrae easterly along the east branch of the St. Marys river through the county of Pictou, thence southeasterly to Melrose in Guysborough county. Another location which was urged was one from Sunnybrae

southerly following Barren Brook to the west branch of St. Marys river, thence easterly through Guysborough county to Melrose, a common point to both locations. The last mentioned location was examined only in a preliminary way. The question as to which of these routes should be adopted had not been settled. No reliable estimate of the cost of the work had been made. There not being at hand sufficient information to show that there was justification for the building of the line and the incurring of the outlay, it was thought well to cancel the contract and abandon the proceedings until complete and reliable data and information could be obtained, and the Minister satisfied that, before committing the country to the expenditure, the same is justified. The Government had acquired the line known as the Sunnysbrae branch from the Nova Scotia Steel and Coal Co. for \$100,000. The remarks as to the obtaining of reliable data and information which would justify the building of the line, applied to the proposed line between Dartmouth and Dean's Settlement, N.S.

We are officially advised that no tenders have been accepted by the Department of Railways for the building of the branch line from Alba to Baddeck, N.S. The papers with regard to this proposed line are by order of the House of Commons, Feb. 5, to be laid on the table. The Minister of Railways in a statement said the two tenders submitted averaged \$69,000 a mile, and as only \$200,000 had been voted on account of the work, he could not see his way clear to allow it to go on. The proposed line is 22 miles long, and the engineer's estimate of the cost was \$1,485,000. The Minister added that it was the intention of the Government to investigate the matter and see if a cheaper route could be got. The member who asked for the papers stated that it was a level country and easy to build a railway through, yet the estimated cost, according to the tenders submitted, was \$69,000 a mile.

A press report, Feb. 12, states that M. P. and J. T. Davis have started work near Dartmouth, N.S., on the line from Dartmouth to Dean's Settlement. (Feb., pg. 67.)

Kaslo and Slocan Ry.—It is said that an agreement has been arrived at between the company and the British Columbia Government for putting in operating condition the remaining section of the K. and S. Ry., and that the agreement will be submitted to the Legislature for confirmation. Later reports state that an arrangement has been made by which the line will be taken over by the C.P.R. (Nov., 1911, pg. 1035.)

Kettle Valley Lines.—Press reports state that a spur line will be built to Skaha Lake, and that the Okanagan River will be dredged so as to permit of the operation of steamboats in connection with the spur line.

Application will be made to the Board of Railway Commissioners in Ottawa, Mar. 5, for authority to build with the Vancouver, Victoria and Eastern Ry. of a joint track from the summit of the Hope Mountains, down the Coquihalla Valley, 26 miles, to Hope. The valley, it is stated, will only permit of the building of one line, and the maximum gradient will be 2%.

Lac Seul, Rat Portage and Keewatin Ry.—Application is being made to the Ontario Legislature for an extension of time within which the line authorized to be built by chap. 128 of the statutes of 1908 may be built. J. F. McGillivray, Kenora, Ont., is solicitor for applicants. (June, 1910, pg. 449.)

Lindsay and Minden Ry.—Application is being made to the Ontario Legislature to incorporate a company with this

title to build a railway, to be operated by steam, electricity or other motive power, from Lindsay to Minden Lake, in Minden tp., or to Bexley, or such other point as may be necessary to connect the same with other railways, and to build branch lines. J. H. Delemere, Minden, Ont., is solicitor for applicants.

Magrath Coal Co.—Application is being made to the Alberta Legislature to authorize the Magrath Coal Co. to build a railway, to be operated by electricity or other power, from its colliery in sec. 2, tp. 7, range 22, west 4th meridian southerly to Magrath, Shepherd and Dunlop, Lethbridge, Alta., are the solicitors.

Midland Continental Ry., etc.—Press reports state that the Midland Continental Ry. has secured funds for building its projected railway from Jamestown, N.D., to Winnipeg, Man., and that construction on the first 50 miles out of Jamestown, will be started in April. F. K. Bull, Racine, Wis., is President. (Sept., 1911, pg. 855.)

Minneapolis, St. Paul and Sault Ste. Marie Ry.—An officer is reported by a U.S. paper as saying that the company intends to build during the current year a connecting line from Drake, N.D., northeast to Fordville, 175 miles.

Moncton and Buctouche Ry.—E. G. Evans, Manager, is reported to have stated, Feb. 9, that surveys are being made with the view of extending the line from Buctouche to Richibucto, N.B., and that it is expected to start construction during the summer. Local press reports state that the extension is to be made with a view to establishing a car ferry service between Richibucto and Summerside, P.E.I.

Montreal and Northern Colonization Ry.—Application is being made to the Quebec Legislature to extend the time for the building of the projected railway, to authorize its being built through Joliette and L'Assomption counties; the building of branch lines; its connection with the National Transcontinental Ry., and the securing of an entrance into Montreal by a tunnel. (May, 1911, pg. 411.)

Montreal Tunnel Proposal.—A deputa-tion, headed by Duncan McDonald, General Manager, Montreal Tramways Co., and accompanied by P. Feurot, representing the engineering firm of Jacobs and Davis, New York, waited on members of the Dominion Government, Feb. 12, to discuss the tunnel project. The company's plans include the building of a railway tunnel under the St. Lawrence River from Longueuil or St. Lambert, and under the city, coming out near Jacques Cartier Jct. The tunnel would be large enough for tracks for steam and electric railways, as well as ordinary traffic, and is said to be a new proposal entirely independent of any other previously proposed project. The Government promised to give full consideration to the proposals when they were matured and plans presented.

Northern Territorial Ry.—In the measure before the Dominion Parliament providing for the incorporation of a company with this title to build a railway from Fort Churchill to the Pacific coast at Port Essington, B.C., with a branch to Edmonton, Alta., the following are named provisional directors:—W. T. Stuart, Toronto; L. P. Sherwood, Ottawa; G. E. Hoimes, R. Wilson, Saskatoon, Sask.; H. G. H. Neville, Edmonton, Alta. (Jan., pg. 22.)

Oregon-Washington Rd. and Navigation Co.—J. D. Farrell, President, in a recent interview at Vancouver, B.C., is quoted as saying: "We have decided to extend our line to Vancouver, but just when a start will be made is uncertain owing to the financial situation. The route has been carefully looked over

and we will get right into the heart of the city." During his stay in Vancouver Mr. Farrell and the officials who were with him interviewed the Northern Pacific Ry.'s local officials and visited the water front, where the new Great Northern Ry. terminals are being laid out.

The Pacific Trans-Canada and Hudson Bay Ry. Co., the incorporation of which is before the Dominion Parliament, proposes to build a railway from Edmonton, Alta., to Fort Churchill, on Hudson Bay, with a branch line through Laurier pass to Prince Rupert, B.C. The provisional directors are: G. W. Swaland, M. Kimpe, P. O. Dwyer, Jas. Smith, Edmonton, Alta.; W. Johnston, Ottawa. (Oct., 1911, pg. 937.)

Prince Edward Island Ry.—The Minister of Railways recently stated in the House of Commons that surveys will be made to determine the points on P.E.I. and the mainland between which the proposed carferries will ply, and also as to the other works required, and that as soon as the necessary information is obtained, and the specifications prepared, tenders will be invited and the work gone on with without delay. It is expected to have the work completed within two years. It is intended to widen the P.E.I. Ry. to standard gauge, and this work will be carried on as soon as practicable. (Feb., pg. 68.)

Prince Edward Island Ry.—We are officially advised that no tender has yet been accepted for the building of the proposed branch lines from Clifton Bridge to Stanley Bridge, and from O'Leary to West Point.

A press dispatch from Ottawa states that the estimated cost of the car ferry and the changing of the gauge of the line is \$1,340,000. The cost of the car ferry is put at \$450,000; the changing of the gauge at \$400,000, and the cost of a third rail at \$490,000. This would imply that it is proposed to operate the line as a standard and narrow gauge line, the existing rolling stock being used for local traffic, and the standard gauge rolling stock of the Intercolonial Ry. being used only for through traffic from and to the island. (Feb., pg. 68 and pg. 71.)

Quebec and Saguenay Ry.—The Department of Railways has entered into a contract with the company under the act granting aid to certain railways, for the building of 170 miles of railway from St. Joachim towards Seven Islands, and including branches to Murray Bay and Bale St. Paul, Que. The first section of this line is under construction, and a part of the line from Murray Bay inland for about seven miles has been completed. (Feb., pg. 68.)

Quinze River and Ottawa Ry.—The Dominion Parliament is being asked to incorporate a company with this title, but the bill as introduced does not state between what points it is proposed to build a railway. The provisional directors are: J. A. O'Brien, F. W. Ross, P. L. Smyth, Montreal; S. G. McClenahan, W. Johnston, Ottawa. (Oct., 1911, pg. 937.)

Reid Newfoundland Ry.—W. D. Reid, President, Reid Newfoundland Co., in an interview Feb. 2, is reported to have said it was the company's intention to add 70 miles of line to its system during the year. (Dec., 1911, pg. 1139.)

St. Charles and Huron River Ry.—See Canadian Northern Ry. Construction, Etc., on another page.

St. John and Quebec Ry.—The New Brunswick Legislature is being asked to pass one or more acts respecting "The Valley Railway, so called," which is to be built by the St. J. and Q. Ry. Co. under a contract between the province and the company. The new powers proposed provide for the incorporation of sep-

arate companies, or for conferring special powers on the St. J. and Q. Ry. Co. for the building of bridges, at Andover. The Mistake and Perry's Point; and an additional act confirming an issue of first mortgage bonds up to \$25,000 a mile, and second mortgage bonds up to \$10,000 a mile.

Preliminary surveys have been made for the whole route, and have been approved by the Minister of Railways. The company is now making final location and revision surveys between Fredericton and Woodstock, and from Fredericton southerly towards Gagetown. Three parties are in the field:—no. 1, under L. B. Lincoln, with headquarters at Woodstock; no. 2, under B. M. Hill, and no. 3, under S. B. Wass, the headquarters of parties 2 and 3 being at Fredericton. Ross Thompson is Chief Engineer.

It is probable, we are advised, that one contract will be let for the building of the whole line, but if not the contracts will be for 30 mile sections. Construction will be started as soon as possible. (Feb., pg. 62.)

Seymour Narrows Bridge Proposals.—The Victoria, B.C., city council has appointed a committee to confer with other committees to be appointed with respect to the proposal to build a railway and general traffic bridge across Seymour Narrows, to connect Vancouver Island with the mainland. At a meeting of the committees, representing Vancouver Island, Feb. 1, it was decided to invite the co-operation of the Provincial Legislature and the Dominion Parliament in the project, and to prepare all the statistical information necessary to present the case before the governments. A resolution was passed favoring the building of a bridge across the Narrows at an early date.

Southern Alberta Ry.—The Alberta Legislature is being asked to extend the time within which the company may build the lines authorized by chap. 40 of the statutes of 1909. White and Laidlaw, Lethbridge, Alta., are solicitors for applicants.

Superior Coal Co.—Surveys are reported to have been made for a line from the Coulee, just west of Taber, Alta., through Superior, and northerly to connect with the projected line of the Canadian Northern Ry. The maximum gradient, it is stated, will not exceed 1.5%. B. K. Bullock is representing the company.

Temiskaming and Northern Ontario Ry.—The speech from the throne at the opening of the Ontario Legislature Feb. 9, after a reference to the increase in the net earnings of the railway for the year 1911, to \$593,000 from \$420,000 in the previous year proceeded:—"The branch to Porcupine has been completed, and there is now 300 miles of the railway in operation, while another branch is being located from the main line to Elk Lake. An agreement has been entered into between the T. and N.O.R. Commission and the G.T.R. Co., granting the latter running rights over the T. and N.O.R., in consideration of which the G.T.R., in addition to an equitable share of the general maintenance of the road, agrees to pay \$300,000 a year as rental for such running rights—this sum representing half the interest on the total cost of the construction of the line."

A deputation waited on the Ontario Government Jan. 31, asking that the line be extended from the present end of the Porcupine branch for about 70 miles, to a junction with the Canadian Northern Ry. at Ruel, and that an arrangement be made with that company to run over its tracks from Ruel to Sudbury.

J. L. Englehart, Chairman of the Commission, is reported to have stated in an interview Feb. 13, that tenders would be asked at an early date for the building of the branch into the Elk Lake re-

gion, about 30 miles. The surveys for the branch had been completed.

J. L. Englehart, Chairman, T. and N.O.R. Commission, is reported to have stated at Cobalt, Feb. 21, that the Elk Lake branch will start from the main line at Earlton, 129 miles north of North Bay, and not from Charlton, as first reported. Charlton is the terminus of the Charlton branch, which runs to that point from Englehart, 8 miles.

In connection with the surveys for the projected extension of the line from Cochrane to James Bay, the Ontario Government has authorized the making of a further geological survey along the projected route, and an examination of the shores of James Bay, with a view to securing a suitable terminal. S. C. Ellis is in charge of the survey, which it is expected will be completed by Sept. 30. (Jan., pg. 23.)

Toronto, Hamilton and Buffalo Ry.—Press reports state that a line is being staked out on either side of the tunnel in Hamilton, with the view of securing an additional right of way. (Feb., pg. 68.)

Winnipeg City Power Line.—The Winnipeg city council has decided that for the present the railway from Lac du Bonnet to the city power plant at Point du Bois, shall continue to be operated by J. G. Rossman, Manager of the city's light and power department. (Jan., pg. 24.)

Winnipeg North Eastern Ry.—The Manitoba Legislature is being asked to authorize the company which was incorporated by chap. 116 of the statutes of 1911, to amalgamate with other companies. Mulock, Loftus, Armstrong and Lindsay, Winnipeg, are solicitors for the company. (May, 1911, pg. 413.)

Winnipeg River Ry.—Application is being made to the Manitoba Legislature for an act amending chap. 117 of the statutes of 1911, by authorizing amalgamation with other companies. Mulock, Loftus, Armstrong and Lindsay, Winnipeg, are solicitors for the company. (May, 1911, pg. 413.)

Car Distribution for Grain Transportation.

The Minister of Trade and Commerce introduced a bill into the House of Commons, Feb. 2, providing for an amendment of sub-sec. 99b, sec. 41, chap. 45, of the statutes of 1908, regarding the distribution of cars for the transportation of grain in the discretion of the Grain Commissioner. The section, when amended, will read as follows: "The Commissioner shall have power in his discretion to order cars to be supplied, contrary to the provisions of this Act, to elevators that are in danger of collapse, to places where grain is damp and liable to become damaged, or for the purpose of distributing seed grain to any point in the Western Division, or in cases where the operator of any country elevator or warehouse reports in writing under oath that some portion of the grain in his elevator or warehouse is heated, and that in order to preserve the same it is necessary to ship such heated grain to the terminal elevator for treatment, provided, however, that no relief shall be granted in such last mentioned cases as long as the warehouseman has plenty of room in his building for the re-handling of such grain."

The Victoria Construction Co. has been incorporated under the New Brunswick Companies Act with a capital of \$99,000, and office at Grand Falls, N.B., to carry on a railway and general contracting business. The provisional directors are:—J. L. White, H. M. Dowling, B. A. Puddington, J. J. McLean, Grand Falls; T. J. Carter, Andover, N.B.; E. R. Teed, Woodstock, N.B.; D. A. McDonald, Antigonish, N.B.

Great Northern Railway Lines in Canada.

United States press reports state that the company has in hand ample funds, from the sale of \$25,000,000 of 4½% bonds last year, for the carrying out of its construction programme for that year. The work to be done during the year, it is stated, includes the completion and extension of several of its lines in Canada.

Midland Ry. of Manitoba.—Midland Great Northern Ry.—We are officially advised that the total length of main line from St. James Jct., on the Canadian Northern Ry. Winnipeg-Emerson line, to the new freight house at Winnipeg, is 5.86 miles. The tracks in the yard have also been laid. The figure mentioned in our report of track laid in 1911, eight miles, was based on the company's report that "about eight miles of track" were expected to be laid on the line into Winnipeg.

It was reported in Winnipeg, Feb. 3, that everything was ready for the operation of G.N.R. trains into the company's Winnipeg terminals. The steel work on some of the subways was not fully completed, but it was expected that it would be finished by the end of February.

Vancouver, Victoria and Eastern Ry. and Navigation Co.—W. H. Burns, engineer in charge of surveys in the Hope Mountain district, arrived in Hope, B.C., Feb. 6, and it is said that he is making arrangements for again starting up construction on the section of the line from Princeton to Hope. The question of the route is not yet finally decided, and application will be made to the Board of Railway Commissioners at Ottawa, May 5, for approval of the building of a joint track with the Kettle Valley Ry. from the summit of the Hope Mountains down to Hope. The ground for the application is that there is only room for a single track along the Coquihalla valley for about 26 miles. Part of this line would be on a 2% gradient. It is stated that the negotiations between the two companies are practically completed. From near Hope the company will run over the Canadian Northern Pacific Ry. to near New Westminster.

Vancouver Terminals.—The company's freight and passenger staff have moved into their offices at 314 Hastings St., Vancouver.

The Vancouver city council has passed a resolution urging the company to resume and press forward the reclamation works at False Creek. The work done up to the present has been largely of a preliminary character. Under the agreement the company has until April 9 to begin the real work of reclamation.

The proposed dock, west of the sugar refinery, plans for which are being prepared, will be 1,200 ft. long, and will be built on concrete piling. An approach of about 200 ft. is being built, and the dredging will be done as the dock is being built. (Feb., pg. 70.)

Lists of Locomotives.—The Board of Railway Commissioners issued order 15947, Feb. 12, requiring all railway companies under the Board's jurisdiction to file with the Board's Chief Operating Officer within 30 days a list showing the numbers of all locomotives owned or leased by them; and also to file from time to time with the Chief Operating Officer a list giving the numbers of all additional locomotives that may be purchased, built, or leased.

A. and W. D. Wheaton, railway contractors, Amherst, N.S., who have subscribed to the Railway and Marine World for several years, in renewing their annual subscription, write: "The Railway and Marine World is steadily growing larger and better."

Mainly About Transportation People.

Edwin Hawley, President, Minneapolis and St. Louis Rd., died in New York Feb. 1.

R. W. Reford, steamship agent, etc., has been elected President of the Montreal Board of Trade.

Willis Chipman, B.A.Sc., M. Can. Soc. C.E., has been elected President of the Engineers' Club of Toronto.

W. C. Dodds, of the General Passenger Department, Canadian Northern Ry., Winnipeg, died there Jan. 20.

J. E. Laughlin, station agent, G.T.R., Windsor, Ont., is reported to have resigned after 12 years service there.

Sir Wm., Lady Whyte and Miss Whyte left Winnipeg, Feb. 5, for Augusta, Ga., where they will remain for some time.

J. M. Fotheringham, A.M. Can. Soc. C.E., District Engineer, Grand Trunk Pacific Ry., Quebec, died there, Feb. 6.

Mrs. Lash, wife of Z. A. Lash, K.C., director, and Senior Counsel, Canadian Northern Ry., Toronto, died there, Feb. 13.

H. J. Cambie, Chief Engineer, Esquimalt and Nanaimo Ry., returned to Vancouver, B.C., from a trip to Europe, Feb. 12.

C. E. Ritchie, President, Central Ontario Ry., Akron, Ohio, has been elected Vice President, Trusts and Guarantee Co., Toronto.

W. L. Garland, barrister, Winnipeg, who died there Feb. 23, aged 26, was the younger brother of Mrs. D. B. Hanna, of Toronto.

G. Belanger, agent Quebec Central Ry. at Morisset, has been appointed a justice of the peace for the county of Dorchester, Que.

Sir C. Rivers Wilson, formerly President of the Grand Trunk Ry. Co., has resigned from the British Electric Traction Co.'s board.

J. C. Hickson, K.C., who died in Montreal, Feb. 2, aged 37, was a son of the late Sir Jos. Hickson, at one time General Manager, G.T.R.

Sir Edmund Osler and W. D. Matthews, C.P.R. directors, Toronto, accompanied Sir William Van Horne on his visit to Cuba, Feb. 15.

J. Brownlee, Superintendent, District 1, Manitoba Division, C.P.R., Kenora, Ont., died there, Feb. 26, after a comparatively short illness.

H. W. Brodie, General Passenger Agent, C.P.R., Pacific Division, and Mrs. Brodie, returned to Vancouver, Feb. 15, from a trip to Honolulu.

F. L. Wanklyn, formerly Managing Director, Montreal Street Ry., has resigned his position as a member of the Montreal city board of control.

Lord Strathcona, who has been suffering from influenza, was reported, Feb. 24, to be improving, his physical strength being well maintained.

Mrs. Hogan, wife of M. J. Hogan, contractor for the Port Colborne, Ont., breakwater, died there, Feb. 5, of pneumonia and was buried in Montreal.

G. W. Hardisty, District Passenger and Freight Agent, Northern Pacific Ry., Montreal, died at Chateaugay, Que., Feb. 9. He was formerly in G.T.R. service.

Frank Potter has been appointed General Manager of the Great Western Ry. of England, succeeding the late Sir John Inglis, to whom he was chief assistant.

Geo. Kitchen, who died at Fredericton, N.B., Feb. 9, was a contractor on several important works in the maritime provinces, including bridges and other work on the C.P.R.

In our February issue it was stated

that John Paul, District Freight Agent, Canadian Northern Ry., Winnipeg, was born in 1853. The date should have been given as 1858.

G. Cobb, Chief Dispatcher, Reid Newfoundland Co., St. John's, Nfld., returned to duty, Feb. 8, from Bay of Islands, where he had been recuperating after an operation for appendicitis.

C. G. Washbon, of the C.P.R. engineering staff, was married at Brandon, Man., Feb. 7, to Miss M. Coldwell, daughter of Hon. G. R. Coldwell, Minister of Education for Manitoba.

Colin Rankin, of Mattawa, Ont., formerly chief factor, Hudson's Bay Co., has been appointed a police magistrate for the National Transcontinental Ry., succeeding P. J. Loughrin.

Sir Donald Mann, Vice President, Canadian Northern Ry., returned to Toronto, Feb. 22, from the Pacific coast, where he spent several weeks recuperating after his recent illness.

P255 James Morrison,
Secretary, Niagara Frontier Summer Rate
Committee and Great Lakes and St.
Lawrence River Rate Committee.

T. P. Brennan, who died suddenly in his office in Montreal, Feb. 20, was engaged as a contractor on the St. Lawrence and Adirondack Ry., and on sections of the C.P.R. in the west.

W. F. Buck, M. Am. Soc. M.E., Superintendent of Motive Power, Atchison, Topeka and Santa Fe Ry., died of pneumonia in his private car whilst en route to Los Angeles, Calif., on Jan. 31.

Sir Thos. G. Shaughnessy will, according to press reports, build a 10-story office building on his property at the northeast corner of McGill and St. Paul Streets, Montreal.

Sir Donald Mann was a passenger on a Great Northern Ry. train which ran into a mud and rock slide near Ocean Park, B.C., Jan. 28. Only one passenger on the train received injuries.

Sir Rodolphe Forget has promised \$50,000 to the Notre Dame Hospital, Montreal, if a similar amount is contributed by others, and \$100,000 if 90 subscriptions of \$5,000 each are secured.

Mrs. W. Nickle, who died at Kingston, Ont., Feb. 1, was a sister of B. W.

Folger, Sr., Kingston, and mother of H. C. Nickle, Superintendent Kingston, Portsmouth and Cataract Electric Ry.

E. L. Brown, formerly General Superintendent, Western Division, Great Northern Ry., at Spokane, Wash., has been appointed Vice President and General Manager, Denver and Rio Grande Rd.

A. B. Overland, a construction engineer on the Canadian Northern Ontario Ry. at Pearl, Ont., is reported to be recovering from a severe illness for which he was treated in the hospital at Fort William, Ont.

M. J. Haney, M. Can. Soc. C.E., contractor, who has been confined to his house at Port Credit, near Toronto, since his return from the South, recovering from a bad attack of influenza contracted in Panama, is convalescent.

L. A. Hamilton, ex-Land Commissioner, C.P.R., now living in Toronto, is one of the directors of the Canada Timber and Lands, Ltd., which was incorporated recently under the Dominion Companies Act, with a capital of \$250,000.

Mrs. Carr, wife of C. E. A. Carr, formerly General Manager, Quebec Ry., Light, Heat and Power Co., and now of New Orleans, La., is a daughter of J. S. and Mrs. Williams, who celebrated their golden wedding in Toronto, Feb. 21.

The Directory of Directors, published by Sir Thos. Skinner, director, C.P.R., states that Sir Wm. Van Horne is director of 21 companies, Sir Wm. Mackenzie, Sir H. Montagu Allan and Lord Furness of 20 companies, and Sir Henry M. Pellatt of 18 companies.

A. Butze was presented with a silver loving cup by the headquarter officials of the G.T.R. at a dinner at St. James' Club, Montreal, recently, on his retiring from the company's service, in which for 16 years he was General Purchasing Agent.

C. W. Johnston, Chief Clerk to W. P. Hinton, General Passenger Agent, G.T. Pacific Ry., Winnipeg, was presented with a diamond ring, on his transfer to the G.T.R. passenger department, Montreal. Mrs. Johnston was also presented with some cut glass.

Mrs. Eldridge Stanton, who with her husband was drowned at Niagara Falls, Feb. 4, owing to the breaking away of the ice bridge over the river while they were on it, was a daughter of N. R. Butcher, official stenographer, Board of Railway Commissioners.

Sir William Van Horne visited Cuba in the early part of February, to look after his interests in the Cuba Rd. and other properties. He stated that owing to the general prosperous condition of affairs in Cuba, his visits to the island would be less frequent.

H. J. Cowie, European Freight Agent, and T. Howell, General Immigration Agent, Canadian Northern Ry., arrived in Liverpool, Eng., Feb. 10, the former after a business trip to Canada, and the latter to make arrangements for the forthcoming season's work.

A. M. Nanton, Managing Director, Alberta Ry. and Irrigation Co., Winnipeg, and Mrs. Nanton were among the Canadians who attended the thanksgiving services at St. Paul's Cathedral, London, Eng., Feb. 6, for the safe return of the King and Queen from India.

Major Leonard, Chairman, National Transcontinental Railway Commission, was the principal guest at a dinner given by the Royal Military College Cadets' Club, Montreal, recently, at which he spoke of the importance of the new line from a military point of view.

Capt. Blakeney, R.N., who died at Bath, Eng., recently, was present at the launching of the Beaver in 1834, and was an officer on board the vessel when she was engaged on survey work on the

coast of British Columbia. The Beaver was the first steamship on the Pacific coast of Canada.

Jas. Slatterie, foreman tender department, G.T.R. shops, Stratford, Ont., was presented with an easy chair and a pipe from the men on his retiring after nearly 40 years' service. The presentation was made by R. Patterson, Master Mechanic.

Sir Wm. Mackenzie, President, Canadian Northern Ry., returned to Toronto, Feb. 3, from a trip to the Pacific coast, and subsequently, accompanied by D. B. Hanna, Third Vice President, went to Ottawa, Montreal, Quebec and Halifax, from whence they returned to Toronto, Feb. 9.

C. W. Power, who has been appointed Railway and Bridge Engineer, City Engineer's Department, Toronto, succeeding E. L. Cousins, appointed Engineer to the Toronto Harbor Commission, was formerly Resident Engineer, Middle Division, G.T.R., Toronto, in which position he also succeeded Mr. Cousins.

Gordon H. O'Hara, who has been appointed General Passenger Agent for Ontario, Allan Line, Toronto, was born at Montreal, June 22, 1879, and entered Allan Line service, Feb. 1, 1894, since when he has been in the inward freight, outward freight, passenger, and accounting departments, and has been acting cashier at intervals.

Sir Donald Mann, Vice President, Canadian Northern Ry., Colonel Davidson, Land Commissioner, and T. G. Holt, Executive Agent for British Columbia, were the principal guests at a dinner given by the New Westminster Board of Trade, Feb. 7. Sir Donald left for the east, Feb. 15, stopped over at Winnipeg, and reached Toronto, Feb. 22.

C. F. Cox, Treasurer, Toronto, Hamilton and Buffalo Ry., and of New York Central lines west of Buffalo, who died at Yonkers, N.Y., recently, was born at Staten Island, N.Y., Jan. 16, 1846. He entered the Canada Southern Ry. service in 1869, and was, successively, Accountant, Assistant Treasurer, Secretary, Vice President and President. The whole of his railway service has been with the Vanderbilt lines.

R. G. McMillan, excursion clerk, and M. Hagerty, advertising clerk, District Passenger Agent's office, G.T.R., Toronto, were presented with a correspondence portfolio and a gold locket, respectively, the former on his transfer to a similar position in the General Passenger Agent's office, G.T.P.R., Winnipeg, and the latter on leaving G.T.R. service to take a similar position in the District Passenger Agent's office, C.P.R., Toronto.

James Morrison, whose portrait appears in this issue, and who is chief rate clerk, Passenger Department, C.P.R., Montreal, has been Secretary of the Niagara Frontier Summer Rate Committee, and of the Great Lakes and St. Lawrence River Rate Committee for several years, and was re-elected at the annual meetings held at Detroit, Mich., recently, the appointment for the Niagara Frontier Summer Rate Committee being made a permanent one.

Hon. F. Cochrane, Minister of Railways and Canals, Sir Thos. G. Shaughnessy, President, C.P.R., C. M. Hays, President, G.T.R. and G.T.P.R.; Sir Wm. Mackenzie, and Sir Donald Mann, President and First Vice President, respectively, Canadian Northern Ry., will compose the Military Transport Board, which the Minister of Militia recently announced was being formed in connection with the Militia Department. They will be given the rank of honorary Colonel.

W. D. Reid, President, Reid Newfoundland Co., on behalf of himself and brothers, has offered to the Newfound-

land Government to build and equip in St. John's a tuberculosis hospital at a cost of \$50,000, and a sanitarium in each of the 16 external electoral districts at a cost of \$3,000 each, on sites to be provided by the Government; the hospitals to be managed and controlled by the Government. The Government has accepted the offer, and propose to name the buildings "The Reid Sanitaria."

The following retired employees of the Canadian Government railways have granted the Imperial Service Medal, in recognition of meritorious service:—G. L. Blais, Levis, Que.; baggage master; F. Davison, Truro, N.S., conductor; A. Gifford, baggage master, Moncton, N.B.; H. W. Henderson, track foreman, York, P.E.I.; E. Jobin, Quebec, baggage master; W. Languille, Brookfield, N.S., track foreman; T. Morency, Trois Pistoles, Que., track foreman; J. O'Malley, Halifax, N.S., freight checker; J. O'Rourke, Moncton, N.B., watchman; L. Proulx, Quebec, conductor.

W. J. Meakin, whose appointment as Locomotive Foreman, C.P.R., Castor, Alta., was announced in our last issue,

P 256 W. J. Press,
Mechanical Engineer and Machinery Expert,
National Transcontinental Railway.

was born at Toronto, Aug. 22, 1869, and entered transportation service in 1885, in the navigation of Georgian Bay, eventually obtaining a master's certificate and operating a steam tug for the French River Boom Co., for 13 years. He entered C.P.R. service, Oct. 15, 1908, at Strathcona, Alta., as a laborer, and in the summer of 1909, was given charge of the stationary boiler, pumping and heating plant there. From Dec. 1, 1910, to Jan. 5, 1912, he was shop foreman at Strathcona roundhouse.

A. E. H. Chesley, who has been appointed General Accountant, Dominion Atlantic Ry., Kentville, N.S., was born near Annapolis Royal, N.S., Aug. 27, 1877, and entered railway service, Oct. 23, 1893, since when he has been, to Oct. 4, 1894, agent and telegraph operator, Yarmouth and Annapolis Ry.; Oct. 4, 1894, to Nov. 4, 1895, agent and telegraph operator, Dominion Atlantic Ry.; Nov. 4, 1895, to Aug. 24, 1897, clerk, Traffic Auditor's office; Aug. 24, 1897, to Oct. 1, 1899, clerk in Accountant's office; Oct. 1, 1899, to June 1, 1907, chief clerk, Accountant's office; June 1, 1907,

to Feb. 1, 1912, Assistant Accountant, all with Dominion Atlantic Ry.

W. L. Upson, General Manager of the projected Ottawa, Smiths Falls and Kingston Ry., was born at Canisteo, N.Y., in 1853, and started work in 1869 as water boy on a construction train between Hornellsville and Susquehanna, N.Y., advancing successively to the positions of timekeeper, brakeman and conductor, the latter appointment being received before he was 20. While serving as brakeman and conductor he studied telegraphy, and in 1873 was appointed night operator at Dalton, on the Erie Rd. In 1874 he was appointed freight agent at Main St., Buffalo, and in 1882 construction train conductor, West Shore Rd. Subsequently he became identified with the organization and building of several lines and was General Manager of the Buffalo, Hamburg and Aurora Ry.

D. J. Murphy, Jr., who has been appointed Superintendent of Transportation, Dominion Atlantic Ry., and whose portrait appears in this issue, was born at Caledonia, Ont., Mar. 3, 1874, and entered railway service Apr. 1892, since when he has been, to Mar., 1893, clerk in local freight office, Yarmouth and Annapolis Ry., Yarmouth, N.S.; Mar. to Nov., 1893, assistant agent, same road, Yarmouth, N.S.; Nov., 1893, to May, 1894, relieving agent, same road; May, 1894, to 1896, operator and relieving dispatcher, Dominion Atlantic Ry., Kentville, N.S.; 1896 to 1900, dispatcher, same road; 1900 to 1906, Chief Dispatcher, same road; 1906 to 1908, Trainmaster, same road, with supervision over car service; 1908 to Jan. 31, 1912, Assistant Traffic Superintendent, same road.

John Corbett, who has resigned the position of General Foreign Freight Agent, C.P.R., Montreal, to enter private business, as mentioned in our last issue, was born in Lanarkshire, Scotland, July 19, 1863, and commenced railway service in 1877 with the Caledonian Ry. He came to Canada in 1882, since when he has been, Nov., 1882 to Dec., 1883, in Audit Department, G.T.R., Montreal; Dec., 1883, to May, 1885, in the office of the Blue Line, Montreal; May, 1885, to Mar., 1904, in Foreign Freight Department, C.P.R., Montreal; Mar., 1904, to Jan., 1912, General Foreign Freight Agent, C.P.R., Montreal. He was entertained at luncheon at the Montreal City Club, Feb. 6, by the local transportation men, and at the Canada Club, Montreal, Feb. 8, by the members of the Montreal Corn Exchange.

R. A. Pyne, whose appointment as Superintendent of Shops, C.P.R., Winnipeg, was announced in our last issue, was born at Toronto, Apr. 10, 1874, and entered railway service, July, 1887, since when he has been, to May, 1893, apprentice C.P.R. shops, Winnipeg; May, 1893, to Dec., 1898, fitter and lathe hand, and Dec., 1898, to July, 1899, gang foreman, there; July, 1899, to Mar., 1901, Shop Foreman, Winnipeg roundhouse; Mar., 1901, to July, 1902, Erecting Shop Foreman, Winnipeg repair shop; July, 1902, to Jan., 1903, General Foreman, Calgary, Alta.; Jan., 1903, to Oct., 1906, Locomotive Foreman, Brandon, Man.; Oct., 1906, to Apr., 1909, District Master Mechanic, Moose Jaw, Sask.; Apr., 1909, to Mar., 1910, District Master Mechanic, Nelson, B.C.; Mar., 1910, to Jan., 1912, Master Mechanic, Alberta Division, Calgary.

J. G. Entwistle, who has been appointed acting Superintendent, District 2, Western Division, Canadian Northern Ry., Saskatoon, Sask., was born at Streetsville, Ont., Dec. 1, 1859, and entered railway service in 1877, in the maintenance of way department of the Credit Valley Ry., and subsequently spent six years in the C.P.R. Mechanical

Department in the west, returning to Toronto, where he had charge of the grading and tracklaying on the C.P.R. from the Union station to North Toronto, to 1889, when he was appointed Roadmaster, Erie and Huron Ry., remaining in that position to 1897, when he went to Winnipeg as locomotive driver, Northern Pacific Ry., and on the taking over of that line by the Canadian Northern Ry., transferred to the latter service, and in 1909 was appointed Road Foreman of Locomotives.

J. F. Chapman, who has been appointed Manager, Thousand Islands Ry., and Oshawa Ry., Deseronto, Ont., and whose portrait appears in this issue, was born at Frankford, Ont., Aug. 25, 1863. Having learned telegraphy, he was appointed first agent of the northern extension of the Central Ontario Ry. at Frankford, and as the line was opened up he was moved to other stations, being officially located at Coe Hill Mines, the northern terminus. On the closing down of the mines, he entered the Bay of Quinte Ry. service, being from June, 1886, to Aug., 1890, chief clerk to General Freight and Passenger Agent, Deseronto, Ont.; Aug., 1890, to Jan., 1895, Superintendent, Thousand Islands Ry., Gananoque, Ont.; Jan., 1895, to Jan., 1904, Assistant General Freight and Passenger Agent, Bay of Quinte Ry., Thousand Islands Ry., Oshawa Ry. and Deseronto Navigation Co., Deseronto, Ont.; Jan., 1904, to Jan., 1912, General Freight and Passenger Agent, same lines.

Capt. W. J. Press, whose portrait appears in this issue, was born at Melbourne, Australia, July 3, 1864, and served an apprenticeship of seven years with the South Australia Government Railways, remaining in that service from 1880 until 1899. On the outbreak of the South African war he went to South Africa attached to the Royal Engineers, graded as staff captain. He was appointed Principal Works Manager of the Imperial Military Railways on Aug. 8, 1900, and resigned Jan. 20, 1904, when he came to Canada to gain experience. He was appointed Inspector of Improved Methods of C.P.R. Angus shops, June, 1905, and resigned the latter end of 1907 to take over the management of Musesens, Ltd., machinery department, Montreal. In May, 1910, he was appointed Mechanical Engineer and Machinery Expert, National Transcontinental Ry., since which time he has had complete control of all mechanical equipment along the line, together with the design and construction of locomotive, car and repair shops.

Dr. H. T. Bovey, F.R.S., one of the founders of the Canadian Society of Civil Engineers, died at Eastbourne, Eng., of Bright's disease, Feb. 3. He was for many years resident in Canada, having been appointed Professor of Civil Engineering and Applied Mechanics at McGill University, Montreal, in 1887. At that time the engineering courses in the University were managed as a branch of the Faculty of Arts, and were without buildings or equipment. The following year, however, a department of applied science was constituted with Prof. Bovey as dean, and to his management and advice the science department owes its development. He was Secretary of the Canadian Society of Civil Engineers from 1887 to 1891; also Treasurer in 1887; councillor from 1892 to 1895; Vice President, 1896 and 1897, and President in 1900. He left Canada a few years ago to return to England, and was appointed Rector of the Imperial College of Science and Technology, which position he resigned early in 1910.

Frederick Passmore Gutelius, M.Can. Soc. C.E., who has been appointed one of the commissioners to investigate expenditures and other matters in connection with the construction of the National Transcontinental Ry., as intimated in

our last issue, was born at Mifflinburg, Pa., Dec. 21, 1864, and graduated from Lafayette College as civil engineer in 1887. He entered railway service in 1888, since when he has been, to 1892, Assistant Engineer and Assistant Supervisor, Pennsylvania Rd., Pittsburgh, Pa.; 1885 to 1898, General Superintendent, Columbia and Western Ry.; 1898 to 1900, Superintendent, C.P.R., Nelson, B.C.; 1900 to 1902, in various positions in C.P.R. Engineering Department; 1902 to Mar., 1906, Engineer of Maintenance of Way, C.P.R., Montreal; Mar., 1906, to Sept. 15, 1908, Assistant Chief Engineer, Eastern Lines, C.P.R., Montreal; Sept. 15, 1908, to Dec. 30, 1910, General Superintendent, Lake Superior Division, C.P.R., North Bay, Ont.; Dec. 30, 1910, to Jan., 1912, General Superintendent, Eastern Division, C.P.R., Montreal.

W. E. Mullins, heretofore General Manager, Northern Ry. of Costa Rica, has been appointed General Manager, United Fruit Co. of Costa Rica, with jurisdiction over the banana farms, railways and all of the United Fruit Co.'s interests there, E. R. Hitchcock, heretofore

P257

D. L. Jones,

District Master Mechanic and Trainmaster,
District 2, Atlantic Division, C.P.R.

Manager of the banana lands, having been assigned to other duties. Mr. Mullins was born at Stratford, Ont., Aug. 13, 1870, and entered railway service on the G.T.R., July, 1887, being employed in the freight and passenger departments until 1891, since when he has been, to 1893, in Assistant Mechanical Superintendent's office, London, Ont.; 1893 to 1897, in Assistant Superintendent's office, London, Ont.; 1897 to 1899, chief clerk to Superintendent, Middle Division, G.T.R., Toronto; 1899 to 1902, secretary to Vice President and General Manager, Central Vermont Ry., St. Albans, Vt.; 1902 to May, 1906, Superintendent of Transportation, Central Vermont Ry., St. Albans, Vt.; June, 1906, to Jan., 1912, General Manager, Costa Rica Ry., and Northern Ry. of Costa Rica.

James Osborne, who has been appointed General Superintendent, British Columbia Division, C.P.R., Vancouver, was born at Montreal, Sept. 19, 1861, and entered railway service in 1874, since when he has been, successively, two years and ten months office boy and

chief clerk to Works Manager, G.T.R.; three years chief clerk to Mechanical Superintendent, C.P.R.; fifteen months chief clerk to Vice President, C.P.R., 1890 to Apr., 1896, Superintendent, Car Service, C.P.R., and from 1892 also in charge of the Fuel Department; Apr., 1896, to Apr., 1899, Assistant to President, C.P.R.; Apr., 1899, to May 1, 1901, General Superintendent, Western Division, C.P.R., Winnipeg; May, 1901, to Apr., 1903, General Superintendent, Atlantic Division, C.P.R., St. John, N.B.; Apr., 1903, to Nov., 1904, General Superintendent, Eastern Division, C.P.R., Montreal; Nov., 1904, to Jan., 1912, General Superintendent, Ontario Division, C.P.R., Toronto. This appointment practically completes Mr. Osborne's circuit of the whole C.P.R. system, as he has been General Superintendent of every division except the Lake Superior one.

W. F. Tye, who has been elected President of the Canadian Society of Civil Engineers, was born at Haysville, Ont., Mar. 5, 1861, and educated at Ottawa University, and the School of Practical Science, Toronto. He entered railway service in 1882, since when he has been, successively, rodman, leveller, transitman on location, and assistant engineer of construction, C.P.R.; 1886 to 1887, transitman and assistant engineer, St. Paul, Minneapolis and Manitoba Ry.; 1888, Engineer of Track and Bridges, Tampico Branch, Mexican Central Ry.; 1890, locating engineer, Great Falls and Canada Ry.; 1891 to 1892, engineer in charge of location, and Division Engineer, Great Northern Ry. Pacific extension; 1892 to 1894, engineer in charge of the change of gauge, Alberta Ry. and Coal Co.'s line; 1895 to 1896, Chief Engineer, Kaslo and Slocan Ry.; 1896 to 1900, Chief Engineer, Columbia and Western Ry.; 1900 to June, 1902, Chief Engineer of Construction, C.P.R.; June, 1902, to May, 1904, Assistant Chief Engineer, C.P.R.; May, 1904, to Feb., 1906, Chief Engineer, C.P.R., which position he resigned to take up private practice.

G. H. Davis, who has been appointed Assistant Engineer of Terminals, C.P.R., Toronto, was born there, Feb. 28, 1881, and entered C.P.R. service, Nov. 14, 1905, since when he has been, to Aug., 1906, rodman on preliminary, location and survey work on the Georgian Bay and Seaboard Ry.; Aug., 1906, to Apr., 1907, rodman and assistant draughtsman, preliminary surveys on the line from Tweed to Toronto, via Belleville, Ont.; Apr., 1907, to Dec., 1909, draughtsman and assistant to the Assistant Engineer, on revision and construction of Georgian Bay and Seaboard Ry. from Port McNicoll to Coldwater Jct., Ont.; Dec., 1909, to Apr., 1910, draughtsman and instrumentman, Division Engineer's staff; Apr. to Oct., 1910, in charge of construction of Mimico cut-off and double track work from Lambton to mileage 10, London section, Ont.; Oct., 1910, to Feb. 1, 1912, assistant to Resident Engineer, Toronto.

H. H. Vaughan, who has been elected Vice President, Canadian Society of Civil Engineers, and whose portrait appears in this issue, was born at Forest Hill, Essex, Eng., Dec. 26, 1868, and educated at King's College, London, Eng. He served an apprenticeship with Nasmith, Wilson and Co., Patricroft, Manchester, Eng., going to the U.S. in 1891. He was engaged with various companies as machinist, draughtsman and assistant engineer of tests, and mechanical engineer, including the Great Northern Ry., Philadelphia and Reading Ry., and the Queen and Crescent Route, and after a period of service with a supply house, was appointed Assistant Superintendent of Motive Power, Lake Shore and Michigan Southern Ry., Mar., 1902, remaining until Feb., 1904, when he was appointed Superintendent of Motive Power, C.P.R.

which position he held until his appointment as Assistant to the Vice President, C.P.R., Dec., 1906. He is President of the Engineers' Club of Montreal, and has been a member of the Canadian Society of Civil Engineers since 1906, and a member of the council since 1910.

J. T. Arundel, General Superintendent, Manitoba Division, C.P.R., was presented with a diamond ring, Feb. 15, by the operating department of the division, on his leaving Winnipeg to become General Superintendent of the Ontario Division, Toronto. A gold brooch was presented to Mrs. Arundel on the same day.

W. F. Buck, Superintendent of Motive Power, Atchison, Topeka and Santa Fe Ry., who died on a private car between Albuquerque and Los Angeles, Cal., Jan. 31, of pneumonia, entered railway service as a locomotive engineer on the Intercolonial Ry. His father was a civil engineer on the building of the line in the vicinity of Newcastle, N.B., where W. F. Buck was born.

H. E. Bissell, whose appointment as Right of Way and Claims Agent, Grand Trunk Pacific Ry., Winnipeg, was announced in our last issue, was born near Noyan, Que., Dec. 31, 1867, and entered railway service in Oct., 1887, since when he has been, to May, 1888, baggage master, freight house foreman and manifest clerk, G.T.R., and Delaware and Hudson Co., Rouses Point, N.Y.; May to Nov., 1888, Assistant Yardmaster, Central Vermont Ry. and Ogdensburg and Lake Champlain Rd., Rouses Point, N.Y.; Nov., 1888, to Dec., 1889, billing clerk, same roads, Rouses Point, N.Y.; Dec., 1889, to Nov., 1892, chief clerk and cashier, same roads, Rouses Point, N.Y.; Nov., 1892, to Apr., 1894, station agent, same roads, and Canada Atlantic Ry., Rouses Point, N.Y.; Apr., 1894, to May, 1900, in private business; June, 1900, to May, 1904, in General Auditor's office, Central Vermont Ry., St. Albans, Vt.; May, 1904, to Feb., 1907, chief clerk of general accounts, same road, St. Albans, Vt.; Feb., 1907, to Apr. 1, 1911, chief clerk to Chief Engineer, G.T.P.R., Montreal; Apr. 1, 1911, to Jan. 1, 1912, Assistant Right of Way and Claims Agent, G.T.P.R., Winnipeg.

Duncan MacPherson, M. Can. Soc. C.E., whose portrait appears on another page, was born at Bath, Ontario, in 1858, of U.E. Loyalist parentage. He was educated at Napanee High School and the Royal Military College, Kingston, from which latter he graduated in June, 1880, standing head of the class in civil engineering, taking honors in several other subjects, and winning the Marquis of Lorne's silver medal for general proficiency. This class was the original one of 18 entering at the inception of the College in 1876, and known ever since as the "Old Eighteen." In Nov., 1880, he was employed as rodman on surveys for the extension of the Canada Central Ry., which in 1881 was merged into the C.P.R. He remained on location and construction of C.P.R. for several years, in various capacities, until he was appointed resident engineer on maintenance of way and construction of branch lines, starting with a territory of about 400 miles. Was afterwards promoted to division engineer, and duties and responsibilities continually increased until he had charge of the whole Eastern Division, comprising 1,500 miles of main track. He resigned from the C.P.R. in 1905, after about 25 years service, on his appointment as Assistant Chief Engineer of the National Transcontinental Railway, remaining in that position till Dec., 1911, when was promoted to be Assistant to the Chairman. He holds certificates of Dominion Land Surveyor and Ontario Land Surveyor, is a life member of English Institution of Civil Engineers, charter member of Canadian Society of Civil Engineers and of the American Railway Engineering Associa-

tion, past Vice President, Canadian Society of Civil Engineers, and now a councillor of same, having been elected to that office for the 14th time, which is oftener than any other member of the society has been so elected. He is the inventor of the MacPherson safety switch and frog, which gives a solid continuous main line, and is in use in Canada and the United States.

The Railway to Hudson Bay.

The contractors for the grading of the first section of the Dominion Government railway from Pas Mission to near Split Lake, 185 miles, J. D. McArthur and Co., Winnipeg, are reported to have sublet the work to McMillan Bros., Winnipeg. This latter firm of contractors began Feb. 7, taking in supplies and plant. A. McMillan, in an interview, is reported to have said the work of getting in supplies and plant will be interfered with owing to the lateness of the season, and the congestion of traffic on the railways, but it is ex-

P 258 Rene Dupont,
Traffic Manager, Canada and Gulf Terminal
Railway.

pected to get in sufficient to keep 600 men at work. Camps will be built every ten miles, and the work pushed as fast as possible. The route to be traversed by the line is interspersed with muskegs, and high ridges, with numerous lakes and water courses, but there is very little rock. A good deal of the work will be "wheelbarrow work," the nature of the ground preventing the use of horses and scrapers, so that progress will not be so fast as on the prairies. Horses and scrapers will be used where possible.

J. P. Gordon, who has been on location work for the past two years, has been appointed Assistant Chief Engineer.

We are officially advised that the matter of awarding contracts for track materials for the line is still in abeyance.

The Naval Department's Hydrographic Branch is said to be preparing a chart showing the results of the most recent surveys made at the mouth of the Nelson River. The chart will, it is said, show a wide channel from 20 to 60 ft. deep, with few shoals, to the point in the river where terminals have been provisionally located, and will demonstrate that with a protection wall for the

roadstead, Port Nelson would be a suitable terminus for the line. However, the question of the navigation of the bay and straits is of importance, and a further survey, in charge of Captains Bernier and Bartlett, is to be made during this year. A further examination will also be made of the land terminals at Port Nelson and Fort Churchill, and engineers were expected to be sent from Ottawa for this purpose by Mar. 1.

London, Eng., press dispatches, Feb. 15, stated that a contract had been let to Pethick Bros., Plymouth, Eng., for the building of docks and grain elevators at Fort Churchill, at a cost of about \$17,500,000. Ottawa officials state that tenders have not been asked for any such work, and that nothing will be done in that direction until the question of whether Port Nelson or Fort Churchill is to be the terminus has been settled. The story probably originated in the fact that an English company is endeavoring to finance the building of a railway from Fort Churchill to Prince Albert and Edmonton, and Pethick Bros. have been associated with some of the people behind that project in contracts in England and elsewhere. (Feb., pg. 79.)

Railway Route Plans Approved.

The following route plans have been approved by the Minister of Railways in addition to those mentioned on pg. 62:—

CANADIAN NORTHERN ONTARIO RY.—Dec. 22, 1911. From Chisholm tp., Nipissing district, on the Montreal-Georgian Bay line, to Capreol tp., Sudbury district, on the Toronto-Sudbury line, about 100 miles.

Feb. 13. Revision of North Bay-Capreol route, about 18 miles.

CANADIAN NORTHERN RY.—Dec. 22, 1911. Strathcona-Calgary line. Revision from Strathcona, via Lacombe, to just south of Red Deer, about 95 miles.

Feb. 9. From near Portage la Prairie southeasterly through Morris to near Stuartburn, 90 miles.

Feb. 9. Chamberlain to MacRorie, Sask., about 75 miles.

Feb. 9. From tp. 26, r. 8, w. 3rd m. to tp. 28, r. 1, w. 4th mer., part of Regina-Red Deer route, about 138 miles.

Feb. 9. From tp. 28, r. 29, w. 3rd mer. to Camrose, about 165 miles.

Jan. 11. Strathcona-Calgary line. Revision from just south of Red Deer to east side of Bow River near Calgary, about 95 miles.

CANADIAN PACIFIC RY.—Feb. 9. Revision of former approval from Lake Johnston to the Weyburn-Lethbridge branch, 30 miles.

GRAND TRUNK PACIFIC BRANCH LINES Co.—Jan. 13. Biggar-Calgary branch, from 4th meridian to tp. 32, range 18, west 4th meridian, about 105 miles.

Jan. 13. Cutknife branch. Revision from tp. 43, range 21, to tp. 44, range 25; west 3rd meridian, about 24 miles.

Jan. 13. From Cedoux southerly and easterly to International boundary in tp. 1, range 11, west 2nd meridian, about 70 miles.

HA HA BAY RY.—Jan. 13. From near St. Dominique village to Government wharf at Bagotville, with branches to St. Alexis, Lake Kenogami and Chicoutimi, Que., about 36 miles.

ST. JOHN AND QUEBEC RY.—Jan. 17. From Rothesay, on the Intercolonial Ry., along the St. John River, to Andover, about 160 miles.

Temiskaming and Northern Ontario Ry.—Revenue for Nov., 1911, \$169,482.55; expenditure, \$113,986.57; net revenue, \$55,495.98; less hire of equipment, etc., \$3,038.61, and outside operations, \$304.71; net result, \$52,152.66.

Canadian Pacific Railway Construction, Betterments, Etc.

The C.P.R. is applying to the Dominion Parliament for authority to appropriate any easement, right of way, or other privileges enjoyed in, to, or over, or in respect of any lands required for the purpose of its railway or any railway controlled or operated by it.

St. John Freight Sheds.—The new freight sheds and warehouses at St. John, N.B., are reported to have been completed. Up to the present the C.P.R. has made an extensive use of the Intercolonial Ry. freight sheds.

Terminal Points on Atlantic Division.—With respect to the reported probable removal of the terminals from Megantic, Que., to Lowelltown or some other point nearer the International boundary, we are officially advised that while the question of the relocation of divisional points on the Atlantic Division has been talked of, nothing definite has been arranged.

Windsor St. Station, Montreal.—Application is being made by the C.P.R. exercising the rights and franchises of the Ontario and Quebec Ry. to the Board of Railway Commissioners, for the right to take additional lands for the purpose of securing the efficient operation of its lines in connection with the enlargement of the Windsor St. terminals, Montreal.

The outer stone work at the new section of the station is reported completed, and the interior work is being pushed ahead as fast as possible. The work of joining up the new building with the old has yet to be done. It is proposed to move the main entrance to the building from its present position on Osborne St. right on to the corner of Windsor and Osborne Streets. There will be two other entrances to the block, one at the foot of the tower and a second at the corner of Windsor St. and St. Antoine St. Nothing definite has been announced as to the train shed which is to be built over the new tracks which are to be laid.

Proposed Tunnel at Ottawa.—D. McNicoll, Vice President, is reported as having said, Feb. 8, that the company is prepared to build a tunnel under the city of Ottawa as soon as the Government gives the necessary permission. An Ottawa dispatch, Feb. 15, states that the matter will be dealt with by the Government at an early date, and that the engineers to whom the plans were referred report favorably. The cost of the work is stated to be about \$3,000,000.

At a hearing before the Board of Railway Commissioners at Ottawa, Feb. 6, it was settled that the basis on which the C.P.R. shall pay the G.T.R. for the use of the Central Station shall be the rental value, not the cost, and evidence will be heard, Mar. 5, as to this point.

Georgian Bay and Seaboard Ry.—Local press reports state that C.P.R. engineers are making surveys for a line from Bethany Jct. through Bethany and Millbrook to the proposed line of the Campbellford, Lake Ontario and Western Ry., in the vicinity of Cobourg or Colborne, Ont. G. H. Garden is in charge.

Grain Elevator at Port McNicoll.—We are advised that a contract has been let to the John S. Metcalf Co., Montreal, for building a reinforced concrete addition to the elevator at Port McNicoll, Ont. The capacity of the additional storage will be 2,000,000 bush., and the estimated cost, together with the additions to the wharf to enable the travelling marine towers to reach the new storage, is approximately \$350,000. The original elevator, which has a capacity of 2,000,000 bush., with a working

house, was built by the John S. Metcalf Co. about a year ago.

Government House Property, Toronto.—We are officially advised that the plans for the development of this property are still under consideration, and that until definite approval has been given nothing can be said as to the layout of the proposed new yards. Under the agreement the Crown gives up possession of the property June 1.

West Toronto Yards, Etc.—The steel work of the new bridge across the tracks at Weston road, West Toronto, is being erected. Several new tracks have been laid at this point, but the principal work in progress is the laying of the tracks in the addition to the yards near Lambton. The subways at Jane St. and Elizabeth St. are being completed, and a large number of tracks are being laid and will be connected up just as soon as the steel work at the subways has been completed.

Cooksville, Etc.—The Board of Railway Commissioners has approved of plans for a new station building at Cooksville, Ont., and it is reported that the work will be started at once. The question of the building of a second track from near Islington through there to Streetsville and other points west has been under discussion for a long time. Several surveys have been made, not only for a second track, but for an entirely new track starting from east of Cooksville station, which would cut out some curvature and reduce the gradients. An engineering party has been going over a route from Cooksville, south of Dundas St., westerly.

Entrance to Stratford, Ont.—The Stratford city council has arranged to submit a bylaw to the taxpayers approving of what is known as the South River route for the company's projected line through the town.

Interchange Track at Goderich.—The Board of Railway Commissioners has directed the C.P.R. to provide an interchange track with the G.T.R. at Goderich, Ont., by June 15.

Collingwood Southern Ry.—We are officially advised that surveys are being made by C.P.R. engineers for a line from near Baxter, on the Toronto-Sudbury line, into Collingwood, Ont., but it is not known whether any construction will be done this season or not.

H. D. Lumsden, M. Can. Soc. C.E., was in Collingwood, Feb. 1 and Feb. 6, in consultation with the town council and the Board of Trade in regard to the projected line. It is proposed to place the passenger station and freight yards on Maple St., and to build a wharf extending out from between Maple and Birch Streets. Mr. Lumsden is reported to have told the committee, Feb. 6, that if all the arrangements could be completed it was expected that construction would be started on May 1.

North Bay Yards, Shops, Etc.—Application is being made to the Ontario Crown Lands Department for a grant of water lots on Lake Nipissing, fronting the company's property at North Bay, Ont., for 3,000 ft. and extending 900 ft. into the Lake. It is proposed to fill in these lots and utilize the area for new repair shops, extensions to the existing works, and additions to the yards. General plans have been submitted to the town council for a six track repair shop to cost about \$250,000. These have been approved, and the council has also consented to the water lots being transferred to the company.

Romford Jct. to Crete, Ont.—The Board of Railway Commissioners has authorized the opening for traffic of the second track from Romford Jct. to Crete, Ont., on the Cartier subdivision.

Fort William Tracks, Etc.—The Board of Railway Commissioners has authorized the company to build a second main

line track across McTavish St., and a double track across Pacific Ave., Fort William, Ont. A contract is reported to have been let to the Canada Foundry Co., Toronto, for the building of a double deck lifting bridge across the Mission River at Fort William.

Winnipeg Freight Yards, Etc.—In order to relieve the congestion in the freight yards at Winnipeg, two plans are under consideration. The first is the remodelling of the present yards and the provision of an additional yard east or west of the city, and the second is the building of a cut-off from East Selkirk to Reaburn, on what was the original survey for the line before it was determined to pass through Winnipeg. If this plan is adopted a sorting yard will have to be provided either at Reaburn or in its vicinity. Plans are being made for this work, but are not yet complete, and in fact it has not been decided what will be done. The accommodation which has to be provided in the yard wherever it is located will be for not less than 5,000 cars, and the question of \$1,000,000 more or less in the cost of carrying out the plans, whatever may be decided upon, scarcely enters into the question. These are the principal statements reported to have been made by George Bury, V.P. and G.M., in reply to a deputation from Selkirk and Stonewall citizens, which waited on him in connection with the newspaper reports as to the route of the projected Selkirk-Reaburn line, which stories, Mr. Bury said, "are absolutely without foundation or authority."

Red River Bridge.—Tenders are under consideration for the building of piers for a new bridge over the Red River, south of the Louise Bridge, Winnipeg. The new bridge is to be built in connection with the proposal to facilitate traffic to and from the station and yards.

Minnedosa.—A local press report states that a new bridge is to be built across the Little Saskatchewan river at Minnedosa, Man., to carry a second track, and that additions are to be made during the current year to the round-house and workshops.

Saskatchewan Buildings.—Tenders were received to Feb. 20 for the erection of the following buildings in the division:—Express building, outward freight shed, and extension to receiving freight shed at Saskatoon; express building, extension to freight shed, six-stall extension to engine house at Swift Current; six-stall addition to engine house at Regina; six-stall new engine house at Wilkie; standard no. 1 brick house, and six-stall engine and boiler house at Outlook; rooming house for dining car department at Moose Jaw; class A2 station buildings at Griffin, Springside, Drake and Dysart.

Weyburn-Lethbridge Line.—The Saskatchewan Minister of Railways informed the Legislature, Feb. 1, that he had been advised by the President of the C.P.R. that this line would be built to 175 miles west of Weyburn, Sask., during this year, and that a further 100 miles would be built in 1913. According to a statement credited to George Bury, V.P. and G.M., the starting point for construction this year will be at Viceroy, Sask., and 100 miles will be graded. The construction programme also includes about 25 miles in Alberta, which will be at the Lethbridge end.

Asquith to Battleford, Sask.—We are officially advised that nothing definite has been arranged in regard to the reported early building of a branch from Asquith to Battleford, Sask. It was reported that the building of this line would have been included in the construction programme for the current year, but it was held over.

Moose Jaw Southwesterly.—The Board

of Railway Commissioners has authorized the opening for traffic of the branch from Moose Jaw southwesterly for 27.4 miles.

Swift Current Branches, Etc.—The Board of Railway Commissioners has authorized the opening for traffic of the branch from Swift Current southeasterly to Neville, 27.4 miles. The work outlined for the current year includes the grading of a further distance of 85 miles on the line started last year northwesterly from Swift Current, and additions to the terminal facilities at Swift Current.

Bridge at Medicine Hat.—We are officially advised that nothing has been finally decided as to the enlargement of the bridge over the Saskatchewan River at Medicine Hat, Sask. The plans are being prepared for the work, but have not yet been completed and approved.

Alberta Division Buildings.—Tenders have been received for the concrete substructure, excavation, etc., for overhead bridges and subway at Edmonton; for the erection of Western lines class A station buildings, at Webb, Namaka, Seven Persons, Winnifred, Dunmore, Clive, Nevis, Lougheed, Aldersyde, Jaffray, Burmis and Galloway, and a Western Lines standard no. 5 station at Yahk; and for an office building in Edmonton six stories and basement, of steel construction, faced with brick and stone, with tile partitions and arches.

Lethbridge to Coaldale.—Local press reports state that surveys have been completed for changing the location of the line between Lethbridge and Coaldale, Alta., to reduce the heavy gradient, and that the new route will give a line about 20 ft. lower than the present one, but as it passes through Henderson Park the citizens are opposing it.

Calgary Shops.—W. L. Murray, of Westinghouse, Church, Kerr Co., general contractors, in an interview Feb. 1, is reported to have stated that construction would be started at the earliest possible moment, and that it was expected to get most of the work done by the end of the year. A U.S. paper recently stated that a contract has been placed there for 3,500 tons of the structural steel required, but George Bury subsequently stated that the order had been placed with a Canadian firm. The construction will be in general charge of T. H. Gilmore, Railway Shop and Equipment Engineer for Westinghouse, Church, Kerr and Co., and F. E. Caldwell, of the same company, will be the superintendent in charge.

Alberta Central Ry.—We are officially advised that the C.P.R. has acquired control of this company's charter. The company originally had power to build a line from Red Deer into the Brazeau coal fields, and subsequently obtained power to extend it through the Peace River district and the Pine River Pass to the Pacific coast, and easterly from Red Deer to Moose Jaw. The company has done some grading westerly from Red Deer, and has laid seven miles of track.

In the course of the discussion on the railway bills in the Alberta Legislature recently the Premier said he had an interview with C.P.R. officials following a letter from George Bury, Vice President, on the subject of building lines in the province. The C.P.R., it was stated, was desirous of building lines without Government aid, and wished for information as to the Government plans in order that there might be no duplication of lines, and that the settled parts of the province might be more quickly given railway facilities. The interview was a satisfactory one. (Feb., pg. 67.)

Kootenai Central Ry.—H. G. Parson, M.P.P., in an interview Feb. 7, said he had been informed by J. S. Dennis, Assistant to the President, that the C.P.R. expected that track would be laid on the

K.C.R. from Golden to Spallumcheen, within four or five months.

Second Track Work in British Columbia.—The construction programme for the year covers the building of a second track from Hammond to Vancouver, 24.1 miles. Press reports stated recently that the section from Hope to Spence's Bridge, 88.9 miles, would also be double tracked, but we are officially advised it is not included in the work for which appropriations had been made for this year.

Coquitlam Yards.—The first part of the plans for the extensive yards to be located at this point will be placed under contract at an early date. A considerable sum having been provided in the appropriations for this year. The work proposed to be done this year includes, it is stated, two subways at the eastern end of the property on the Dewdney trunk road under an agreement with the municipality; the laying of 25 miles of track for yard purposes; a 12-stall roundhouse, and a coaling plant; water service. The tracks will be laid so as to form the nucleus of the complete yards.

New Westminster Wharf.—Tenders were received to Feb. 20 for the building of a wharf at New Westminster, B.C., parallel to that of the British Columbia Electric Ry. The wharf will run out to deep water.

Railway to the North Shore.—The British Columbia Minister of Railways had before him Feb. 9 the plan proposed by the C.P.R. for a line along the north shore of Burrard Inlet. The North Vancouver city and municipal authorities, and the Vancouver, Westminster and Yukon Ry., and the Burrard Inlet Tunnel and Bridge Co., which are jointly interested in a railway and bridge project along practically the same route, appeared to protect their interests. The C.P.R. made its application for the approval of its plans under its general powers as to branch lines. After hearing all the parties the Minister intimated that the company's plans would be approved with the proviso that the rights of the municipalities along the waterfront would be protected, and that the company first building would give the other companies running rights. (Feb., pg. 72.)

Toronto Union Station Plans.

The question of the plans for the proposed new union station in Toronto came before the Board of Railway Commissioners in Toronto Feb. 10. When the matter was previously before the commission the C.P.R. was directed to submit plans which would be satisfactory to it. This was submitted, Feb. 10, but proved unacceptable to the G.T.R. The Board favors the G.T.R. plans for the station building, and decided that York St. be kept open. The Chief Commissioner stated that there were some matters which the commission desired to discuss with its engineering and operating officers, and upon these being decided the necessary orders would be made as speedily as possible. J. W. Leonard, Assistant to the Vice President, C.P.R., was subsequently reported as stating that that company could not work under the G.T.R. plans and sooner than do it would erect a separate station.

G. Ruel, Chief Solicitor, Canadian Northern Ry., was reported on Feb. 22 as having stated that the C.N.R. and the C.P.R. would build a union station at North Toronto, at the southeast corner of the junction of the present C.P.R. tracks and Yonge St.

The Grand Trunk Pacific Ry., during Dec., 1911, patented land grants amounting to 140.84 acres.

British Columbia's Railway Construction Policy.

The Premier of British Columbia made a statement in the Legislature, Feb. 20, as to the railway legislation to be submitted for approval.

The Canadian Pacific Ry. is to be authorized to take over under a lease the Esquimalt and Nanaimo Ry., so that the line may be used as its Vancouver Island division, and will be aided in extending the line from Parksville to Comox. On the mainland an arrangement has been completed by which the Kaslo and Slocan Ry. will be taken over by the C.P.R., the rights of the Great Northern Ry. being acquired for \$400,000. During the past year the line was operated for some miles by a local syndicate. The entire line is to be brought up to standard, and for this purpose the C.P.R. is to receive \$100,000 as aid from the province.

The Kettle Valley Ry. is to be aided \$10,000 a mile for the building of a line from Coldwater Jct. to Hope, 50 miles. The Vancouver, Victoria and Eastern Ry. is to be given running powers over this section of the line on terms to be arranged. Two hundred thousand dollars is also to be granted in aid of the building of a bridge across the Fraser River at Hope, for the purpose of connecting up this line with the C.P.R. This will give a short line between the Kootenay district and Vancouver over the C.P.R., and a route via the V.V. and E. Ry. This line will reach Vancouver from Hope over the Canadian Northern Pacific Ry., and its own line through New Westminster.

The Canadian Northern Pacific Ry. is to be aided in building a line from Kamloops via Grand Prairie and Vernon to Kelowna, with a branch to Lumley, a distance of 145 miles, and will also be given a grant of \$35,000 a mile for a line from Campbell River to Hardy Bay on Vancouver Island, about 150 miles.

The Pacific and Great Eastern Ry. will be given a guarantee of bonds on the same basis as the guarantee to the Canadian Northern Pacific Ry. for the building of its line on the mainland, for the building of a line from Fort George to North Vancouver, and on by way of the Second Narrows bridge into Vancouver and New Westminster. Provision is to be made for the operation of a car ferry service to Victoria. This is the first section of the projected line from Vancouver to the Peace River country. The contract for the building of this line, press reports state, has been arranged with Foley, Welch and Stewart.

Car Building at Port Arthur.—A tentative agreement was entered into Feb. 16 between the city of Port Arthur, Ont., and the promoters of a company for the location of a car building plant there. The city is asked to provide a site of 125 acres at Bare Point, upon which it is proposed to erect buildings and put in a plant at a cost of \$1,350,000. The city is to guarantee the company bonds for \$500,000. The bylaw confirming the agreement will be submitted to the taxpayers at an early date. This project, press reports state, is independent of the proposition that the Canadian Car and Foundry Co. locate a branch plant in Port Arthur.

The Canadian Forestry Convention, which met at Ottawa in February, discussed the attitude of railways to forest fires, the discussion being led by E. A. Stirling, Forester, Pennsylvania Rd.

F. Atherton, purser on the C.P.R. s.s. Empress of Britain, was charged in London, Eng., Feb. 20th, with defrauding the C.P.R. and the Dominion Express Co. of some \$15,000.

Douglas Fir for Car Building.

In a bulletin on "Wood-using Indus-
tries, 1910," issued recently by the In-
terior Department's Forestry Branch, a
comparison of the mechanical and phys-
ical properties of Douglas fir and yel-
low pine is given, which, it is claimed,
shows "that, in addition to the physical
qualities which render Douglas fir as
easily worked, as readily polished, and
as suitable for finish as yellow pine,
Douglas fir possesses the mechanical
qualities which render yellow pine
adaptable for car building and for use
in situations where durability, strength
and resistance to compression are re-
quired."

It is also stated that "Douglas fir is
a splendid wood for car building, the
use for which the greater part of the
21,000,000 ft. of yellow pine was im-
ported in 1910. It is strong, hard, stiff,
large and clear enough for car frames.
is suitable for car sidings and ceilings,
and is beautiful enough for the interior
finish of passenger cars. It has been
used for the interior finish of private
cars in the U.S."

We submitted the above to the prin-
cipal Canadian car building companies
and asked for opinions. The following
replies have been received:

Canadian Car and Foundry Co., Ltd.

N. CURRY, President, writes: "Most of
the railways prefer Douglas fir for pas-
senger car sills, chiefly on account of its
straight grain and freedom from knots
and cross grained wood, and most of
them will permit the use of Douglas fir
for box car framing instead of southern
pine, but the rail freight makes this
wood considerably higher for this pur-
pose than the southern wood. We have
been using large quantities of Douglas
fir for carbuilding and other purposes for
25 years, and it has always given good
results. There will never be any trouble
about the Douglas fir competing with the
southern wood at the same prices; in
fact, in many cases we pay from \$1 to
\$4 per thousand feet more for the Dou-
glas fir than for the southern wood."

Preston Car and Coach Co., Ltd.

D. M. CAMPBELL, General Manager,
writes: "Douglas fir is used by us instead
of yellow pine quite freely. The only
reason that we do not use more of it, is
because we can get yellow pine cheaper
than we can get Douglas fir, on account
of the long haul. But with all deference
to the opinion of other experts, we con-
sider that yellow pine is fully as durable
as Douglas fir."

R. W. Burnett, General Master Car
Builder, C.P.R., writes:—"We have used
considerable Douglass fir and with very
good results."

Extensions to Canadian Pacific Railway Hotel System.

Extensive additions, etc., are to be
made to a number of the C.P.R. hotels
this year, involving the expenditure of
several millions of dollars. The com-
pany's hotel system, which was com-
menced in 1886 by the erection of moun-
tain chalets at Field, Glacier and North
Bend, B.C., has been extended as the
demands of travel required until now the
company is the largest hotel proprietor
in Canada and one of the largest in the
world.

The Banff Springs Hotel at Banff,
Alta., was started in 1887 and has been
repeatedly added to. This year a fire-
proof wing, a swimming pool, bath
houses, etc., will be built at an approxi-
mate cost of \$500,000.

The Hotel Vancouver, at Vancouver,
B.C., was the third of the series to be
built. The several additions which have

been made having proved inadequate for
the demands, very extensive alterations,
amounting to a rebuilding of the old part,
including new public rooms, are to be
carried out, which will place the hotel
in the front rank of the system.

The chalet at Lake Louise, near Lag-
gan, Alta., was only a log cabin when
originally built in 1890. In 1892 it was
burnt down and in 1893 a small frame
structure, to accommodate a dozen
guests, was built. At present there are
165 rooms. A fireproof wing is to be
added with 100 rooms, and three large
cottages containing 100 rooms in all,
which will bring the total room accom-
modation up to 365. The approximate
cost is \$500,000.

The Chateau Frontenac, Quebec, built
in 1892, has already been twice added
to. A scheme is in hand which, when
approved and carried out, will almost
double the capacity.

The Place Viger, Montreal, built in
1898, has recently had an addition com-
pleted and another addition is planned.

The Royal Alexandra, Winnipeg, built
in 1906, is already too small and an ad-
dition is contemplated.

The Empress, Victoria, B.C., built in
1907, is being added to for the second
time, the new wing containing large gen-
eral rooms and 80 bedrooms.

The Algonquin, St. Andrews, N.B.,
built in 1905, was largely added to in
1910. A large wing is being added to
provide enlarged kitchen accommoda-
tion and additional bedrooms.

The smaller hotels at McAdam, N.B.,
Field, Glacier, Sicamous and Revelstoke,
B.C., have all been largely added to since
they were first built.

At Calgary, B.C., construction has
started on an hotel which will cost over
\$1,000,000.

The company's hotels, with their
present capacity, can accommodate
4,500 guests. The present dining room
capacity is 3,247, which gives but a
slight idea of the service rendered. The
number of meals served last year was
approximately 2,871,922.

gust.

Canadian Northern Railway Earnings, Expenses, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net	Net Increase
July \$1,475,900	\$1,114,300	\$361,600	\$13,400
Aug. 1,420,600	1,105,900	314,700	51,700
Sept. 1,576,400	1,157,000	419,400	38,200
Oct. 2,028,900	1,348,500	680,400	99,900
Nov. 2,001,500	1,336,300	665,200	106,300
Dec. 1,831,400	1,327,000	503,800	144,600

\$10,344,700	\$7,389,600	\$2,945,100	\$154,100
Inc. \$ 2,288,100	\$1,834,000	\$ 454,100	
Approximate earnings for Jan., \$1,228,100, against \$822,600 for Jan., 1911.			

Canadian Pacific Railway Earnings, Expenses, Etc.

Gross earnings, working expenses, net profits, increases or decreases, compared with those for 1910-11, from July 1, 1911:—

Earnings.	Expenses.	Net Profits.	Increases.
July \$ 9,661,818.14	\$5,958,789.81	\$3,703,028.33	\$218,408.74
Aug. 10,421,904.42	6,346,333.41	4,075,571.01	383,898.68
Sept. 10,040,084.97	6,131,638.17	3,917,446.80	5,847.16
Oct. 11,207,991.99	6,526,887.24	4,681,104.75	175,944.23
Nov. 10,570,694.80	6,584,328.31	3,987,366.49	250,214.23
Dec. 10,651,871.67	6,549,141.41	4,102,730.26	819,196.37

\$62,566,365.99	\$38,090,118.35	\$24,476,247.64	\$1,853,530.41
Inc. 6,778,713.35	\$ 4,925,173.94	\$ 1,853,539.41	

Approximate earnings for Jan., \$7,201,000, against \$5,650,000 for Jan., 1911.

Grand Trunk Railway Earnings, Expenses, Etc.

Subject to audit, the accounts for the half-year to Dec. 31, 1911, show the following results:—

Gross receipts	\$4,135,800
Working expenses	3,110,900

Net receipts	\$1,024,900
Income from rentals, outside operations, and car mileage balances	11,700

Total net revenue	\$1,036,600
Net revenue charges for the half-year, less credits	530,800

Balance	\$ 505,800
Deduct, Canada Atlantic Ry. deficiency for the half year	\$32,300

Detroit, Grand Haven and Milwaukee deficiency for the half year	6,600
.....	38,900

Surplus	\$ 466,900
---------------	------------

This surplus of \$466,900 added to the balance of \$11,690 from June, 1911, makes a total of \$478,500 available for dividend, which will admit of the payment of the dividend for the half year on the 4% guaranteed stock, and first and second preference stocks, and a dividend of 1½% for the year on the third preference stock, leaving a balance of about \$6,800 to be carried forward.

The accounts of the Grand Trunk Western Ry. for the half year, after providing for the deficit of \$31,461 at June 30, 1911, show a surplus of \$12,500, which amount is carried forward to the current half year.

Approximate earnings for Jan., \$3,422,296, against \$3,381,239 for Jan., 1911.

CANADIAN PACIFIC RAILWAY

NOTICE.—The Canadian Pacific Railway Company will apply to the Parliament of Canada, at its present session, for an Act authorizing and empowering it to expropriate any easement, right of way or other privilege enjoyed in, to or over, or in respect of any lands and required for the purpose of its railways, or any railway controlled or operated by it, and for other purposes.

Dated at Montreal this 8th day of February, 1912.

WALTER R. BAKER,
Secretary.

Pringle, Thompson & Burgess,
Ottawa Agents.

Traffic Orders by the Board of Railway Commissioners.

The dates given for orders are those on which the hearings took place, and not those on which the orders were issued:—

Heated Cars for Mineral Waters, Etc.

15819. Jan. 18.—Re application of Sanitaris, Limited, Arnprior, Ont., for an order directing railway companies to furnish, during cold weather, heated cars for the carriage of mineral water, ginger ale, and other bottled beverages, in quantities aggregating not less than carload lots, from one shipper to one or more consignees and destinations. Upon the hearing of the application on Jan. 4 last, and hearing what was alleged on behalf of the railway companies and the applicant, and judgment being withheld for further information; and upon its now appearing that railway companies had in practice systems of carrying way freight in heated cars, and upon the complaint of the Sudbury Brewing and Malting Co. that such systems had been abandoned, and upon its appearing that

P259
H. H. Vaughan,
Vice President, Canadian Society of Civil Engineers.

at a meeting of the Canadian Freight Association, held on Nov. 23, 1911, as alleged in a circular sent to the Sudbury Brewing and Malting Company by the C.P.R. local freight agent at Sudbury, that it was resolved that shipments in less than carload lots in heated cars should be discontinued, and its appearing that no notice of the withdrawal of such privilege had been given to shippers, and such withdrawal has worked hardship, it is ordered that all railway companies subject to the Board's jurisdiction shall forthwith re-establish the system or system in practice by them of carrying less than carload lots in heated cars during the winter of 1910-1911, and shall forthwith grant to all shippers the rights and privileges of such shipping facilities in respect to such traffic as were in force upon their various lines during the said winter, until further order, or until the reasonableness of the withdrawal of such facilities can be passed upon by the Board.

Boston and Maine Rd. Tariffs.

15858. Feb. 1.—Re supplement no. 1 to Boston and Maine Rd. Joint and Pro-

portional Class-rate and Commodity Tariff C.R.C. 1219: Whereas the said tariff was issued by the railroad company on May 24, 1911, to take effect on June 28, 1911, but was not filed with the Board until Jan. 4, 1912, and whereas, under the provisions of the Railway Act, any special tariff advancing the toll previously authorized to be charged shall be filed by the company with the Board at least 30 days previously to the date on which such tariff is intended to take effect, it is ordered that the said Supplement no. 1 be disallowed.

Freight Rates in British Columbia.

15961. Feb. 15.—The complaint of the Vancouver Board of Trade, alleging discrimination in freight rates by the railway companies operating in British Columbia having been fully heard and the Board having, during the progress and before the completion of that case, undertaken a general enquiry into freight rates in Alberta, Saskatchewan, Manitoba and Ontario west of Port Arthur, and it appearing that the questions arising in the Vancouver Board of Trade case are so intimately related with the rates now under enquiry in the other provinces above mentioned that this matter cannot be satisfactorily disposed of separately. It is ordered that the Province of British Columbia be added to those above mentioned and that the said general enquiry shall extend to and cover all the freight and passenger rates in that province; that all the evidence and exhibits as well as the argument shall form part of the record in said enquiry; that any interested party may supplement as he may desire to the said evidence and argument.

Joint Tariffs Less Than Local Rates.

At a meeting of the Board in Ottawa, April 16, railway companies under Dominion authority will be required to show cause why an order should not issue calling for the publication and filing of joint tariffs between points in Canada (where such have not already been published and filed) less than the combination of the local rates of the several companies to and from the junction point or points; also to state their views as to the extent to which the said local rates might be reduced on joint traffic.

Canadian Society of Civil Engineers' Officers.

Following are the officers for the current year, as changed by the elections at the annual meeting in Montreal recently:—

PRESIDENT—W. F. Tye, Toronto. VICE PRESIDENTS—H. Holgate, Montreal; J. G. Sullivan, Winnipeg; H. H. Vaughan, Montreal. TREASURER—E. Marceau, Montreal. SECRETARY—C. H. McLeod, Montreal. COUNCILLORS—P. S. Archibald, Moncton, N.B.; E. E. Brydone-Jack, Winnipeg; C. E. Cartwright, Vancouver; C. R. Coutlee, Ottawa; J. S. Dennis, Calgary; A. E. Doucet, Quebec; G. H. Duggan, Montreal; C. L. Fellowes, Toronto; H. E. T. Haultain, Toronto; L. A. Herdt, Montreal; J. A. Hesketh, Winnipeg; H. M. Jaquays, Montreal; P. Johnson, Montreal; J. C. Kennedy, Vancouver; J. G. LeGrand, Winnipeg; W. B. Mackenzie, Moncton, N.B.; D. MacPherson, Ottawa; C. N. Monsarrat, Montreal; R. McCall, Halifax; J. T. Morkill, Sherbrooke; P. E. Parent, Quebec; J. M. Shanly, Montreal; A. F. Stewart, Toronto; W. J. Stewart, Ottawa.

J. W. Harkom, M. Can. Soc. C.E., consulting engineer, Melbourne, Que., read a paper on "Locomotive boilers, their development and troubles; some reflections and suggestions," before the Canadian Railway Club in Montreal Feb. 13.

Railway Rolling Stock Notes.

Five of the locomotives which are being built by the Montreal Locomotive Works for the C.P.R. will be changed to burn oil fuel on the British Columbia Division after they have been delivered.

The 2,000 steel frame box cars, which the C.P.R. recently ordered in the U.S., as mentioned in a previous issue, will be C.P.R. standard, 80,000 lbs. capacity, 36 ft. long inside, with steel underframes and superstructures, etc.

The 200 stone cars, which the C.P.R. is having built at the Nova Scotia Car Works, Halifax, as mentioned in our last issue, will be of steel, 41 ft. long, with wooden sides, and of 80,000 lbs. capacity. They are to be practically standard steel underframe cars.

The three Lidgerwood flat cars which were built by the Canadian Car and Foundry Co., Montreal, for the Dominion Equipment and Supply Co., Winnipeg, as mentioned in our last issue, have been forwarded to Mackenzie, Mann and Co., Winnipeg.

The Central Vermont Ry. has purchased four Pacific type locomotives, from the Baldwin Locomotive Works, Philadelphia, Pa., three switching locomotives from the Lima Locomotive Co., Lima, O., and six passenger, one dining, two baggage and two parlor cars, from the American Car and Foundry Co., St. Charles, Mo.

The 90 tank cars, which the C.P.R. is having built in the U.S., mention of which has already been made, will have a capacity of 40 tons, and tank capacity of 8,393 imperial gallons, or 10,075 U.S. gallons. They will be equipped with steel under frames and friction draft gear, and fitted with safety valves and steam heating pipes to assist the loads to be discharged.

The Northern Construction Co. and Foley Bros. have ordered one special Rodger double plough distributing car, 30 tons capacity, from the Hart-Otis Car Co. It will be built by the Canadian Car and Foundry Co. Following are the principal dimensions:—

Length over end sills 32 ft.
Width over side sills 8 ft. 9 ins.
Height from rail to floor 4 ft. 1 1/4 ins.
Truck centres 23 ft. 8 ins.
Wheel base of truck 5 ft. 2 ins.

In our last issue in referring to the order given by the G.T.P.R. to the Canadian Locomotive Co., Kingston, Ont., for 15 consolidation locomotives with Schmidt superheaters, it was stated that it was in addition to the 25 already on order with the company. We are advised that the order is not an additional one, the order for 25, details of which we gave in our Jan. issue, has been reduced to 15, owing to the company not being able to make the delivery required.

The ten sleeping cars, which the C.P.R. is having built in the U.S., and which were mentioned in our Jan. issue, will be practically duplicates of the company's present type, and will be equipped with Tower couplers, Westinghouse air brakes L.N. 1612, cast steel body bolsters, Safety Car Heating and Lighting Co. lamps, Canadian Gold Car Heating and Lighting Co., hot water heating with Frumveller heater, with circulation controlled by C.P.R. standard heat controller.

The Quebec Central Ry. has ordered two mogul freight and two 10-wheel passenger locomotives from the Canadian Locomotive Co., Kingston, Ont. Following are the chief particulars:—

Mogul.	10 Wheel.
Weight in working order.....144,000 lbs.	155,000 lbs.
Weight on drivers 122,000 lbs.	123,000 lbs.
Cylinders, diameter and stroke 20 by 26 ins.	20 by 26 ins.
Driving wheels, diar. 57 ins.	63 ins.
Driving journals 8 1/2 by 12 ins.	9 by 12 ins.
Boiler pressure 200 lbs.	200 lbs.
Tender, weight 104,000 lbs.	114,000 lbs.
Brake equipment Westinghouse E.T. 6	

The Winnipeg board of control has under consideration tenders for the supply and delivery in that city a 44 or 45 ton steam shovel, equipped with a dipper of at least 1 1/4 yard capacity, and having a clear lift from rail to bottom of dipper door when open of not less

Hart-Otis Dump Cars for British Columbia Electric Ry.

than 16 ft. The city is also considering tenders for a standard gauge locomotive having a haulage capacity of at least 350 tons on a 1% gradient, and equipped both back and front with attachment for coupling to standard 80,000 lb. capacity freight cars.

The illustrations on this page show Hart-Otis dump cars, of which the British Columbia Electric Ry. ordered 16,

Hart-Otis Dump Cars for British Columbia Electric Ry.

of 60,000 lbs. capacity, from the Hart-Otis Car Co., Ltd., Montreal, which have been built by the Canadian Car and Foundry Co. Following are the principal dimensions: Length inside, 25 ft.; length over buffers, 28 ft. 2 1/2 ins.; width inside, 7 1/2 ft.; width over all, 8 ft.; height inside, 4 ft.; height over all, 8 ft.

4 1/2 ins.; doors on each side, 5; angle of door opening 30 degrees. They are equipped with Simplex bolsters and brake beams.

Following are chief details of the 410 Otis semi-composite general service cars, which the C.P.R. is having built by the Canadian Car and Foundry Co., under license from the Hart-Otis Car Co:—
Length over end sills 38 ft. 9 ins.
Length inside 36 ft. 5 ins.
Width over all 9 ft. 11 1/4 ins.
Width inside 9 ft. 7 ins.
Height inside 5 ft.
Height from rail to top 9 ft. 4 3/4 ins.
Height from rail to floor 4 ft. 4 3/4 ins.
Truck centres 26 ft.
Wheel base of truck 5 ft. 6 ins.
Number of doors on each side 6
Width of door opening 2 ft. 2 ins.
Length of door opening 36 ft. 5 ins.

The Canadian Car and Foundry Co., between Jan. 15 and Feb. 15, made the following deliveries—24 Otis all steel cars to the Algoma Steel Co.; three first class cars, one sleeper, 221 ballast cars, 242 box cars, 382 steel under frame flat cars and one snow plough to the Canadian Northern Ry.; 13 steel under frame flat cars to the Canadian Pacific Ry.; one first class car, 143 steel frame box cars and 20 steel under frame flat cars to the Intercolonial Ry.; three tourist cars to the Grand Trunk Pacific Ry.; 31 steel frame box cars to the Grand Trunk Ry.; and four pay-as-you-enter composite street cars to the Montreal Tramways Co.

The Canadian Northern Ry., between Jan. 15 and Feb. 15, received the following additions to rolling stock—355 flat cars, four first class cars, one snow plough and 230 box cars, from the Canadian Car and Foundry Co., Montreal; one rotary snow plough from the Montreal Locomotive Works; 10 switching locomotives from the Canadian Locomotive Co., Kingston, Ont.; six second class cars and 30 box cars from the Crossen Car Co., Cobourg, Ont.; 188 Hart cars from the Hart-Otis Car Co., Montreal; one consolidation locomotive from the Canada Foundry Co., Toronto, and 110 box cars from the Nova Scotia Car Works, Halifax, N.S.

Following are chief details of the two G2 locomotives which the C.P.R. is building at its Angus shops, Montreal, as mentioned in our last issue:—
Weight on drivers 142,000 lbs.

Weight of engine 224,000 lbs.
Heating surface, tubes 2,730 sq. ft.
Heating surface, firebox 175 sq. ft.
Heating surface, total 2,905 sq. ft.
Superheater heating surface 539 sq. ft.
Grate area 45.6 sq. ft.
Cylinders, diar. and stroke 22 1/2 by 28 ins.
Driving wheels, diar. 69 ins.
Brake equipment Westinghouse ET 6

Lubricator	Detroit 22
Valve gear	Walschaert
Superheater	Vaughan and Horsey
Boiler pressure	200 lbs.
Tender, weight loaded	140,000 lbs.
Capacity, water	5,000 imp. gals.
Capacity, coal	12 tons

O'Brien, McDougall and O'Gorman have ordered 100 forty-ton Hart convertible ballast and construction cars, 1912 design, from the Hart-Otis Car Co. These will be built by the Canadian Car and Foundry Co. Following are the principal dimensions:—

Length over end sills	36 ft. 8 ins.
Width over side sills	8 ft. 10 ins.
Length inside as hopper	20 ft. 10 ins.
Length inside as gondola	34 ft. 8 ins.
Width inside	8 ft. 8 ins.
Width over all	10 ft. 2½ ins.
Width at top	9 ft. 10 ins.
Height from rail to floor	4 ft. 4½ ins.
Height from rail to top	8 ft. 13½ ins.
Height inside	3 ft. 9¼ ins.
Truck centres	26 ft. 8 ins.
Wheel base of truck	5 ft. 4 ins.
Length of hopper door opening	16 ft. 8½ ins.
Width of hopper door opening	2 ft.

Following are the chief details of the 300 forty ton steel under frame Hart convertible cars, which the G.T.P.R. recently ordered from the Hart-Otis Car Co., Montreal, as announced in our last issue:—

Length between end sills	36 ft. 10 ins.
Width over side sills	8 ft. 9 ins.
Length inside as hopper car	22 ft. 4 ins.
Length inside as gondola car	34 ft. 8 ins.
Width inside	8 ft. 8 ins.
Width overall	10 ft. 2½ ins.
Width at top	9 ft. 10 ins.
Height from rail to top of floor	4 ft. 4½ ins.
Height from rail to top of car	8 ft. 2 ins.
Height inside	3 ft. 9¼ ins.
Truck centres	27 ft. 10 ins.
Wheel base of truck	5 ft. 4 ins.
Total wheel base of car	33 ft. 2 ins.
Length of hopper door opening	17 ft. 8½ ins.
Width of hopper door opening	1 ft. 10 ins.

The C.P.R. stock cars, 308 of which are being built at its Angus shops, Montreal, as mentioned in our last issue, will have capacity for 60,000 lbs., and be 36 ft. long, 8 ft. 3¾ ins. wide by 7 ft. 5 in. high, inside measurements. They will have steel centre sills and draft gear connections, four hay racks and four water troughs, extending from centre doors to ends of cars, the flooring will be extra heavy, of special quality, and the ends will have steel posts and thick lining to provide for carrying rails, etc. Two side doors will be provided, each 5 ft. wide by 6 ft. 9½ ins. high, and the end doors will be 2 ft. wide by 14 ins. high, about 5 ft. above the floor, at one end, and 8 ins. wide by 8 ins. high, 18 ins. above the floor, at the other end.

Following are chief details of the U3d locomotives which the C.P.R. is building at its Angus shops, Montreal:—	
Weight in working order	137,000 lbs.
Boiler, type	Straight top, radial stayed
Boiler pressure	200 lbs.
Wheel base, driving	11 ft. 6 ins.
Cylinders, diar. and stroke	18 by 26 ins.
Boiler tubes, no. and diar.	232 2 ins.
Heating surface, tubes	1,406 sq. ft.
Heating surface, firebox	138 sq. ft.
Heating surface, total	1,544 sq. ft.
Grate area	29 sq. ft.
Valves	11 ins. piston
Valve gear	Walschaert
Driving wheels, diar.	52 ins.
Brake equipment	Westinghouse ET 6
Lubricator	Detroit 22
Weight of tender loaded	90,000 lbs.
Weight of tender light	44,000 lbs.
Capacity, water	3,500 imp. gals.
Capacity, coal	10 tons

Following are the chief details of the 25 consolidation locomotives which the G.T.P.R. is having built by the Montreal Locomotive Works, as mentioned in our last issue:—

Cylinders, diar. and stroke	23 by 30 ins.
Driving wheels, diar.	63 ins.
Boiler pressure	180 lbs.
Boiler, outside diar. at front end	68¾ ins.
Firebox	96¾ by 75¼ ins.
Grate area	50.62 sq. ft.
Wheel base, driving	17 ft.
Wheel base, total engine	25 ft. 9 ins.
Wheel base, engine and tender	57 ft. 3½ ins.
Weight on leading truck	26,400 lbs.
Weight on drivers	184,800 lbs.

Weight total of engine	211,200 lbs.
Weight of tender	144,660 lbs.
Tender capacity, water	8,000 gals.
Tender, coal capacity	10 tons
Superheater	Schmidt
Fire doors	Franklin automatic
Valve gear	Walschaert
Brake equipment	Westinghouse E.T. for engine and tender, with cross compound pump

Following are chief details of the 400 steel underframe flat cars, 40 tons capacity, which the C.P.R. is having built by the Canadian Car and Foundry Co., Montreal, as mentioned in our last issue:—

Length over end sills	36 ft. 4 ins.
Centre to centre of trucks	26 ft. 5¾ ins.
Length over dead woods	37 ft. 5¾ ins.
Length over floor	36 ft. 10 ins.
Width over floor	9 ft.
Width over side sills	8 ft. 10 ins.
Width over stake pockets	9 ft. 7½ ins.
Height top of rail to top of floor	4 ft. 2¾ ins.
Top of rail to centre of drawbar	2 ft. 10½ ins.
Draft springs	M.C.B. Class G
Couplers	Simplex
Air brakes	Westinghouse K.C. 812
Wheels	Cast iron, C.P.R. standard for 40-ton cars
Axles	M.C.B. 5 by 9 ins.
Journal bearings	Canadian Bronze Co.
Journal boxes	McCord mail. iron
Truck springs	C.P.R. standard
Brakebeams and bolsters	Simplex
Side bearings	Susmihl
Journal bearing wedges	Drop forged
Brake shoes	Steel back

The Grand Trunk Ry. has ordered 250 thirty-ton all wood refrigerator cars from the Canadian Car and Foundry Co. Following are the chief particulars:—

Length over end sills	40 ft.
Length over buffers	41 ft.
Length inside, clear	34 ft. 3¼ in.
Width over side sills	9 ft. ¾ in.
Width at eaves	9 ft. 6½ ins.
Width in clear	8 ft. 1¾ ins.
Height top of rail to top of running board	12 ft. 8¾ ins.
Clear height top of floor to under side of ceiling	7 ft. 2½ ins.
Draft springs	M.C.B. 6¼ by 8 ins.
Couplers	R. E. Janney
Body bolsters	Simplex
Air brakes	Westinghouse K.C. 1012
Truck, type	G.T.R. standard arch bar 30-ton
Brake beams and truck bolsters	Simplex
Truck springs	M.C.B. Class A
Wheels	33 ins. cast iron
Axles	Steel
Journal bearings	M.C.B.
Journal boxes	Cast iron

Following are chief details of the 75 ten-wheel simple superheater locomotives, class D 10, which the C.P.R. is having built by the Montreal Locomotive Works, as already reported:—

Weight on drivers	149,000 lbs.
Weight of engine	198,500 lbs.
Weight of tender	134,000 lbs.
Wheel base, driving	14 ft. 10 ins.
Wheel base, total, engine	26 ft. 1 in.
Wheel base, engine and tender	55 ft. ¾ in.
Boiler, type	Wagon top
Boiler pressure	200 lbs.
Heating surface, tubes	2,229 sq. ft.
Heating surface, firebox	180 sq. ft.
Heating surface, total	2,409 sq. ft.
Heating surface, superheater	408 sq. ft.
Grate area	49 sq. ft.
Tubes, no. and diar.	239 2 ins. and 24 5 ins.
Cylinders, diar. and stroke	21 by 28 ins.
Driving wheels, outside diar.	63 ins.
Capacity, water	5,000 imp. gals.
Capacity, coal	12 tons
Axles	main 9½ by 12 ins., others 9 by 12 ins.
Brakes	Westinghouse E.T. 6
Headlight	Pyle National Electric
Valve gear	Walschaert
Superheater	Vaughan and Horsey

Following are the chief details of the four Pacific type locomotives which the Central Vermont Ry. has ordered from the Baldwin Locomotive Works, as reported in our last issue:—

Cylinders	22 by 28 ins.
Valves	Balanced slide
Boiler, type	Straight, radial stayed
Boiler, diameter	70½ ins.
Boiler, pressure	200 lbs.
Firebox	96¾ by 75¼ ins.
Tubes, no. and diar.	305 2 ins.
Heating surface, firebox	70 sq. ft.
Tubes, length	20 ft. 7 ins.
Heating surface, tubes	3,274 sq. ft.
Heating surface, firebrick tubes	28 sq. ft.
Heating surface, total	3,472 sq. ft.
Grate area	50.6 sq. ft.
Driving wheels, diar. outside	73 ins.
Journals	9½ by 12 ins.
Engine truck wheels, diar.	31 and 49 ins.
Journals	Front, 6½ by 10½, and 8 by 14 ins.

Wheel base, driving	13 ft. 4 ins.
Wheel base, total engine	33 ft. 2 ins.
Wheel base, engine and tender	62 ft. 3½ ins.
Weight on drivers	140,000 lbs.
Weight on front truck	38,000 lbs.
Weight on back truck	37,000 lbs.

O'Brien, McDougall and O'Gorman have ordered seven 10-wheeled freight locomotives, type 460, from the Montreal Locomotive Works for delivery in May. Following are the chief dimensions, etc.:—

Cylinders, diar. and stroke	18 by 24 ins.
Driving wheels, diar.	50 ins.
Boiler pressure	160 lbs.
Firebox	90 by 33¾ ins.
Tubes, no. and diar.	198 2 ins.
Tubes, length	12 ft. 3 ins.
Wheel base, driving	10 ft. 6 ins.
Wheel base, engine total	20 ft. 8 ins.
Wheel base, engine and tender	47 ft. 6 ins.
Weight on leading truck	26,000 lbs.
Weight on drivers	83,000 lbs.
Weight, total, engine	109,000 lbs.
Weight of tender	87,000 lbs.
Heating surfaces, tubes	1,261 sq. ft.
Heating surface, firebox	115 sq. ft.
Heating surface, total	1,376 sq. ft.
Grate area	21 sq. ft.
Tractive power	21,150 lbs.
Adhesion factor	3.92
Tender	Eight wheel type
Capacity, water	4,000 gals.
Capacity, coal	8 tons

Following are chief details of the eight ten-wheel locomotives which the C.P.R. is having built by the Montreal Locomotive Works, as mentioned in our last issue:—

Cylinders, diar. and stroke	19 by 24 ins.
Driving wheels, diar.	62 ins.
Boiler, diar. front end	54¾ ins.
Boiler pressure	180 lbs.
Firebox	96¾ by 41¾ ins.
Tubes, no. and diar.	117 2 ins. and 18 5 ins.
Tubes, length	11 ft.
Wheel base, driving	11 ft. 10 ins.
Wheel base, engine	22 ft. 1 in.
Wheel base, engine and tender	49 ft. 5¾ ins.
Weight on leading truck	38,500 lbs.
Weight on drivers	103,000 lbs.
Weight, engine, total	141,500 lbs.
Weight, tender	106,000 lbs.
Heating surface, tubes	926 sq. ft.
Heating surface, firebox	146 sq. ft.
Heating surface, total	1,072 sq. ft.
Grate area	28 sq. ft.
Maximum tractive power	21,380 lbs.
Factor of adhesion	4.82
Tender, type	8-wheel
Capacity, water	4,000 imp. gals.
Capacity, coal	10 tons
Weight, total engine	215,000 lbs.
Weight, engine and tender	350,000 lbs.
Tender wheels, diar.	34 ins.
Capacity, water	7,000 gals.
Capacity, coal	10 tons
Bell ringer	G.T.R. standard
Brakes	Westinghouse American E.T.
Steam heating	Gold system
Driving tires, springs and engine truck wheels	Standard Steel Works Co.
Superheater	Vaughan and Horsey
Headlight	Oil

Rutland Rd.—The Public Service Commission of the State of New York is being asked to sanction the transfer of the control of the Rutland Rd. from the New York Central and Hudson River Rd., to the New York, New Haven and Hartford Rd. The Rutland Rd. owns the Rutland and Noyan Ry. in Canada.

Manitoba and Northwestern Ry.—The Dominion Parliament is being asked to increase the company's bonding powers. The M. and N.W. Ry. is now owned by the C.P.R.

N. Curry, President, Canada Car Co., and Mrs. Curry, left Montreal, Feb. 9, for Jamaica, B.W.I.

J. L. Blaikie, who died in Toronto, Feb. 19, aged 88, was for some years a director of the old Northern Ry.

H. E. Grant, of the British Columbia Electric Ry., addressed the Vancouver branch of the National Electric Light Association, Feb. 7, on "Some Notes on Opportunity."

The American Railway Engineering Association's annual convention will be held at Chicago, Ill., Mar. 19 to 21, when the committee reports will be received and discussed. The speakers at the annual dinner will include Hon. F. D. Monk, Dominion Minister of Public Works.

Transportation Appointments Throughout Canada.

The information under this head, which is almost entirely gathered from official sources, is compiled with the greatest care, so as to ensure absolute accuracy. Anyone who may notice any error in our announcements will confer a favor by advising us.

Allan Line Steamship Co.—H. F. Bradley, heretofore General Passenger Agent for Ontario, Toronto, has been appointed Assistant Passenger Manager, Montreal.

G. H. O'Hara, heretofore in the auditing department, Montreal, has been appointed General Passenger Agent for Ontario, vice H. F. Bradley, promoted. Office, Toronto.

F. S. MacGregor, heretofore Travelling Agent for Ontario, has been appointed Assistant General Passenger Agent for Ontario. Office, Toronto.

Canadian Northern Ry.—W. A. Trenholm, heretofore in the General Passenger Department, Intercolonial Ry., Moncton, N.B., has been appointed chief passenger rate clerk in Assistant General Passenger Agent's office, C.N.R., Toronto.

A. Shields, General Master Mechanic, Winnipeg, is reported to have resigned to look after his private business.

H. Moore has been appointed Freight Overcharge Adjuster, with jurisdiction over all overcharge and station relief claims. Office, Winnipeg.

B. R. Marsales, heretofore City Freight Agent, Edmonton, Alta., has been appointed Contracting Freight Agent, Brandon, Man., vice T. J. Pettersen, resigned.

J. G. Entwistle, heretofore locomotive engineer, Edmonton, Alta., has been appointed acting Superintendent, District 2, Western Division, vice C. D. Fisher, resigned. Office, Saskatoon, Sask.

Canadian Pacific Ry.—C. F. Reed, heretofore station agent, Greenville, Me., has been appointed Travelling Freight Agent, Atlantic Division, St. John, N.B., vice C. K. Howard, resigned to enter St. John and Quebec Ry. service.

The unsold portion of the company's land grants and any lands acquired through other companies in Manitoba, Saskatchewan and Alberta, the British Columbia Southern, the Columbia and Western and the Columbia and Kootenay land grants, the company's town-site properties west of Lake Superior excepting Vancouver, Kamloops and those on Vancouver Island, the company's coal lands and coal rights in Canada, as well as the mines at Lethbridge, Bankhead and Hosmer, the company's tie and timber operations in British Columbia, the company's irrigation works, and everything connected with the sale, development or investigation of any of these properties and works have been vested in a department to be known as the Department of Natural Resources.

J. S. Dennis, heretofore Manager of Irrigation and Land Interests in Alberta and British Columbia, has been appointed Assistant to the President. He will have charge of the Department of Natural Resources, and will perform such other duties as may be assigned to him by the President from time to time. All officers and employees of the several branches of the department will be under his supervision and direction. Offices, Windsor St. station, Montreal, and Calgary, Alta.

A Calgary, Alta., press dispatch says J. S. Dennis arrived there from Montreal, Feb. 22, and announced a number of appointments.

P. L. Nasmith, heretofore General Manager, Alberta Railway and Coal Co., Lethbridge, is reported to have been appointed Manager, Department of Natural Resources. Office, Calgary.

Thos. Heeney, heretofore Chief Accountant and Treasurer, Irrigation, Alberta and British Columbia Land Department, is reported to have been ap-

pointed Assistant Manager, Department of Natural Resources and head of the treasury and accounting branch. Office, Calgary.

A. S. Dawson, heretofore Chief Engineer, Irrigation Department, is reported to have been appointed Chief Engineer, Department of Natural Resources. Office, Calgary.

F. Stockett, heretofore General Manager, C.P.R. collieries at Bankhead and Hosmer, B.C., is reported to have been appointed General Superintendent, Coal Mining Branch, Department of Natural Resources. Office, Calgary.

Allan Cameron, heretofore General Traffic Agent, New York, is reported to have been appointed Superintendent, Land Branch, Department of Natural Resources.

F. W. Russell, heretofore Chief Clerk, Land Department, Winnipeg, is reported to have been appointed Land Agent there.

F. T. Griffin, heretofore Land Com-

P260 James Osborne,
General Superintendent, British Columbia
Division, Canadian Pacific Railway.

missioner, Winnipeg, will, it is said, remain there in an advisory capacity.

A branch office for the sale of lands in Saskatchewan will, it is said, be opened at Saskatoon, in charge of W. G. Gerrow, from the Land Department, Winnipeg.

G. Hodge, heretofore Superintendent, District 2, Ontario Division, London, has been appointed General Superintendent, Eastern Division, vice F. P. Gutelius, resigned. Office, Montreal.

Consequent on the resignation of John Corbett, as announced in our last issue, the position of General Foreign Freight Agent has been abolished and the duties merged in those of W. T. Marlow and F. G. Frieser, Import and Export Freight Agents, respectively.

T. Hunter, heretofore clerk arranging diversions, has been appointed chief rate clerk, Import Freight Agent's office, Montreal, vice J. G. Galley, appointed Contracting Import Freight Agent, Atlantic Steamship Lines, as announced in our last issue.

G. H. Bull, H. M. Haas and F. L. Jones, of the International Correspondence School, Scranton, Pa., have been appointed Apprentice Instructors on the

Eastern Lines. They will also give advice on questions connected with maintenance and operation of cars and locomotives. The headquarters of the first named are at Toronto, and of the other two at Montreal.

J. T. Arundel, heretofore General Superintendent, Manitoba Division, Winnipeg, has been appointed General Superintendent, Ontario Division, vice Jas. Osborne, transferred. Office, Toronto.

H. C. Grout, heretofore Assistant Superintendent, District 1, Ontario Division, Havelock, has been appointed Superintendent, District 1, Ontario Division, vice R. King, transferred. Office, Toronto.

G. H. Davis, heretofore transitman, District 4, Ontario Division, Toronto, has been appointed Assistant Engineer, Toronto Terminals.

J. J. Brignall, Travelling Passenger Agent, Toronto, is acting chief clerk to District Passenger Agent, Toronto, vice J. J. Rose, resigned.

R. King, heretofore Superintendent, District 1, Ontario Division, Toronto, has been appointed Superintendent, District 2, Ontario Division, vice G. Hodge, promoted. Office, London, Ont.

J. Simpson has been appointed Night Locomotive Foreman at Ignace, Ont.

John McLaughlin, heretofore Electrician at Fort William, Ont., has been appointed Resident Electrician there, vice T. Doust, resigned.

T. Spence, heretofore Car Foreman at Brandon, Man., has been appointed Car Foreman at Fort William, Ont., vice J. J. Corner, transferred to Brandon, Man.

F. Baird has been appointed Erecting Shop Foreman at Fort William, Ont.

D. C. Coleman, heretofore Superintendent of Car Service, Western Lines, Winnipeg, has been appointed acting General Superintendent, Manitoba Division, vice J. T. Arundel, General Superintendent, transferred to Ontario Division. Office, Winnipeg.

A. Hatton has been appointed acting Superintendent of Car Service, Western Lines, vice D. C. Coleman, appointed acting General Superintendent, Manitoba Division. Office, Winnipeg.

W. K. McLeod has been appointed acting Locomotive Foreman, Winnipeg, vice — Webster on sick leave.

J. J. Corner, heretofore Car Foreman at Fort William, Ont., has been appointed Car Foreman at Brandon, Man., vice T. Spence, transferred to Fort William, Ont.

T. Jones has been appointed Night Locomotive Foreman at Brandon, Man.

W. T. Daniel has been appointed Resident Engineer, District 2, Saskatchewan Division. Office, Regina.

F. J. Gage, Night Locomotive Foreman at Regina, Sask., has resigned.

F. Hill has been appointed Car Foreman at Sutherland, Sask.

C. H. Zerbach has been appointed Car Foreman at Moose Jaw, Sask.

R. Cooper has been appointed Assistant Car Foreman at Moose Jaw, Sask.

W. Jordan has been appointed Locomotive Foreman at Moose Jaw, Sask., vice G. Motta assigned to other duties.

C. W. Leggett has been appointed Car Foreman at Swift Current, Sask.

T. Bell has been appointed Locomotive Foreman at Outlook, Sask.

G. Benedict, agent at Harriston, Ont., is reported to have been appointed Supervisor of Agencies, Calgary, Alta.

R. Taylor has been appointed Locomotive Foreman at Dunmore, Alta.

C. A. Cotterell, heretofore Chief Dispatcher, District 1, British Columbia Division, has been appointed acting Superintendent, District 1, British Columbia Division, vice T. Kilpatrick on sick leave. Office, Revelstoke.

W. McKinty, heretofore Bridge and Building Master, Calgary, Alta., has been appointed Bridge and Building Inspector. Headquarters, Cranbrook, B.C.

J. A. MacDonald has been appointed District Passenger Agent, Nelson, B.C., vice W. J. Wells, resigned.

Jas. Osborne, heretofore General Superintendent, Ontario Division, Toronto, has been appointed General Superintendent, British Columbia Division, vice F. F. Busted, at present on sick leave, but who, it is reported, will be appointed General Superintendent, Manitoba Division, Winnipeg.

Dominion Atlantic Ry.—Owing to increase in work in connection with the engineering and mechanical departments, Wm. Yould, heretofore Engineer and Mechanical Superintendent, has asked to be relieved of the duties of Engineer, and has been appointed Mechanical Superintendent. Office, Kentville, N.S.

M. A. Fullington, heretofore Resident Engineer, District 4, Ontario Division, C.P.R., Toronto, has been appointed Resident Engineer, D.A.R. Office, Kentville, N.S.

D. J. Murphy, Jr., heretofore Trainmaster and Assistant Traffic Superintendent, has been appointed Superintendent of Transportation, with which latter position the Trainmaster's duties are incorporated. Office, Kentville, N.S.

A. E. H. Chesley, heretofore Assistant Accountant, has been appointed General Accountant and Chief of Accounting Department. Office, Kentville, N.S. The position of Assistant Accountant has been abolished.

The offices of Accountant and Traffic Superintendent are abolished by the retirement of H. A. Prat and Wm. Fraser from the service.

G. A. Parker, heretofore Auditor, has been appointed Traffic Auditor. Office, Kentville, N.S.

G. Sterling, heretofore in the Paymaster's office, has been appointed Paymaster. Office, Kentville, N.S.

Grand Trunk Pacific Ry.—H. A. Woods, Assistant Chief Engineer, has transferred his office from Montreal to Winnipeg.

E. C. Ferguson has been appointed Car Foreman at Rivers, Man.

A. J. Roberts, heretofore General Foreman, Temiskaming and Northern Ontario Ry., North Bay, Ont., has been appointed Locomotive Foreman, G.T.P.R., Regina, Sask., vice C. E. Brooks, transferred.

C. E. Brooks, heretofore Locomotive Foreman, Regina, Sask., has been appointed Locomotive Foreman, Wainwright, Alta.

H. Gallagher has been appointed Roadmaster, Mountain Division. Headquarters, Prince Rupert, B.C.

Grand Trunk Ry.—S. J. Roy, heretofore station agent at Ingersoll, Ont., has been appointed Travelling Auditor. Headquarters, Montreal.

J. A. Clancy, heretofore car distributor and chief clerk to Master of Transportation, Durand, Mich., has been appointed Travelling Car Service Agent, Western Division, vice J. C. Talmage, promoted. He will investigate and report on car service conditions generally at all stations and perform such other duties as may be assigned to him from time to time. Office, Durand, Mich.

C. O. Busby has been appointed Master of Bridges and Buildings, Western Division, vice J. A. Sheedy, resigned. Office, Durand, Mich.

E. G. Hewson, heretofore Assistant Resident Engineer, has been appointed Resident Engineer, Middle Division, vice C. W. Power, resigned to enter Toronto city service. Office, Toronto.

Hudson Bay Ry.—J. P. Gordon, Winnipeg, has been appointed Assistant Chief Engineer, as reported in our last issue.

Intercolonial Ry.—D. McDonald, heretofore station ticket agent at Levis, has been appointed Superintendent, Mont-

real and St. Flavie District, vice W. A. Dube. Office, Levis, Que.

Minneapolis, St. Paul and Sault Ste. Marie Ry.—W. R. Sheldon, heretofore General Agent, Helena, Mont., has been

P261 J. F. Chapman,
Manager, Thousand Islands Ry. and
Oshawa Ry.

appointed District Freight and Passenger Agent, Calgary, Alta.

New York Central Lines.—W. V. Lifsey has been appointed General Eastern Passenger Agent, vice E. J.

P262 D. J. Murphy, Jr.,
Superintendent of Transportation, Dominion
Atlantic Railway.

O'Hayer, Jr., resigned. Office, 1216 Broadway, New York.

Niagara, St. Catharines and Toronto Ry.—Consequent on the transfer of John Paul, heretofore Freight and Passenger Agent, to Canadian Northern Ry. service at Winnipeg, the duties of W. Phil-

lips, General Freight Agent, lines east of Port Arthur and west of Ottawa, and R. L. Fairbairn, Assistant General Passenger Agent, lines east of Port Arthur, in Ontario and Quebec, Canadian Northern Ry., Toronto, have been extended to cover the N. St. C. and T. Ry., under the direction of G. H. Shaw, General Traffic Manager, C.N.R.

Pennsylvania Rd.—C. B. Brodie, heretofore chief clerk, District Passenger Agent's office, Washington, D.C., has been appointed Canadian Passenger Agent. Office, Traders Bank Bldg., Toronto.

Quebec Ry., Light, Heat and Power Co.—R. M. Reade has been appointed Superintendent, City Division, vice A. J. McDonald, resigned. Office, Quebec.

Reid Newfoundland Co.—E. P. Hughes has been appointed Travelling Engineer, covering territory between St. John's and Clarendville, including branches.

St. John and Quebec Ry.—S. B. Wass, A.M. Can. Soc. C.E., of Presque Ile, Me., is reported to have been appointed Assistant Chief Engineer with headquarters at Fredericton, N.B.

C. K. Howard, heretofore Travelling Freight Agent, Atlantic Division, C.P.R., St. John, N.B., has been appointed Right of Way Agent, St. J. and Q.R.

Thousand Islands Ry., Oshawa Ry.—J. F. Chapman, heretofore General Freight and Passenger Agent, has been appointed Manager, in charge of the Operating and Traffic Departments. He will continue to act as General Freight and Passenger Agent, Bay of Quinte Ry. Office, Deseronto, Ont.

White Pass and Yukon Route.—We are officially advised that the position of General Manager, left vacant owing to the appointment of O. L. Dickeson as President, as announced in our last issue, will not be filled for the time being at least.

Dump Ash Pans Specified for Locomotives.—The Board of Railway Commissioners passed order 15988, Feb. 17, as follows: "All railway companies subject to the Board's jurisdiction, operating steam locomotives, shall, on or before Dec. 31, 1913, equip such locomotives as may be in use with ash pans that can be dumped or emptied without the necessity of any employe going under such locomotive except in cases of emergency. After the said date it shall be unlawful for any such railway company to use any locomotive not equipped as above provided."

The Guelph Junction Ry. Co. has received from the C.P.R. \$8,794.93, under the terms of the lease for the operation of the line for three months ended Dec. 31, 1911. The amount for the same period in 1910 was \$7,801.07.

White Pass and Yukon Ry.—Gross earnings for 12 months ended Dec. 31, 1911, \$1,067,590, against \$1,199,358 for same period 1910.

G. Parent, son of S. N. Parent, chairman of the National Transcontinental Railway Commission, was married in Quebec, Feb. 16, to Miss K. Grenier.

A Winnipeg press dispatch of Feb. 23 says the C.P.R. Construction Department has let contracts for building 308 miles of line, principally in Saskatchewan.

E. A. Robert, President, Montreal Tramways Co., is reported as having stated, Feb. 17, that orders had been given for 65 new cars, making 100 in all ordered by the company since Jan. 1; that 20 of the first order of cars had been delivered, and that it was expected to have nearly all the cars ordered on the lines by July 1. The cars are being built by the Canadian Car and Foundry Co.

National Transcontinental Railway Construction, Etc.

The amendments to the National Transcontinental Railway Act, rendered necessary by the decision of the Government to place the control of construction, etc., under one commissioner, are two in number. The first substitutes a new section for sec. 9 in the original act, declaring that the work is to be under the charge and control of one commissioner, who shall be a body corporate with the title of the Commissioners of the Transcontinental Railway. The second substitutes a new section for the original sec. 22 and authorizes the Minister of Finance, on the recommendation of the Minister of Railways, to pay claims and accounts approved and certified by the Commissioner, provided that no money shall be so paid until a sufficient appropriation has been made by parliament for the purpose.

G. Lynch Staunton, K.C., of Hamilton, Ont., has been appointed by the Dominion Government as Chairman, and F. P. Gutelius, M. Can. Soc. C.E., who recently resigned the General Superintendency of the Eastern Division, C.P.R., Montreal, as the other member of a commission to investigate all matters bearing on the actual construction of the National Transcontinental Ry., between Moncton and Winnipeg, the expenditures thereon, the system adopted for such construction and the management of the undertaking generally. The commissioners are given power to examine witnesses under oath and to exercise the widest possible powers under the act relating to public enquiries.

In the House of Commons, Feb. 14, the Minister of Railways read a statement showing work done on the line between Moncton and Winnipeg, up to Dec. 31, 1911, and the value of the work required to complete the line, on the basis of the estimated cost, as follows:—

Items.	Value of work done to Dec. 31, 1911.	Value of work required to complete
Grading, contract items, including clearing, excavation, culverts, sub-structures of bridges, tracklaying, ballasting, ties, signals, interlocking appliances, telegraph lines, fencing, water supply, track scales, temporary trestles, and extra work, also pump houses and pumps and substructure of Cap Rouge viaduct	\$ 79,368,700	\$30,510,300
Right of way and expenses	1,964,500	2,231,500
Rails and fastenings	10,214,500	2,985,500
Buildings	985,300	3,971,700
Steel superstructure of bridges, including flooring	4,611,400	1,441,600
Surveys and expenses	4,148,000	22,000
Engineering and expenses	7,681,700	3,850,300
Transcona locomotive shop plant and equipment, including water supply, sewerage system and lighting	2,334,300	602,700
Transcona car shop plant and equipment	171,200	1,129,800
Proposed car ferry at Quebec		650,000
Terminals at Quebec, and line from Quebec bridge to Quebec city	508,500	9,091,500
Rentals of joint terminals at Winnipeg	131,300	118,700
Headquarters — Salaries and expenses	1,732,900	1,267,100
Total	\$113,853,300	\$57,872,700

The Minister went on to state that in addition to the estimated cost of \$171,726,000 represented by the two columns in the above table, it had been calculated that the cost for interest to Dec. 31, 1913, would bring the total cost of the line to \$187,781,128.68. The interest on this amount for seven years would be \$39,434,031; the betterments, unforeseen

and unestimated, \$7,884,840.32; interest charges on this amount estimated at \$900,000, making the capital estimated cost of the line to Jan. 1, 1921, \$236,000,000. If the line was not taken over by the G.T. Pacific Ry. Jan. 1, 1914, there would have to be added another \$4,500,000 for interest, and if the line did not earn 3% in excess of working expenditure for the three years after 1920, there would be \$22,050,000 to be added to the cost for interest.

The engineer's report of progress laid before the House of Commons, Feb. 15, showed that there had been completed 1,587.7 miles or 76.82% of the grading; 1,378.7 miles of main line track, and 278.7 miles of track in sidings had been laid; 982.8 miles of telegraph lines strung, and 82.75% of the bridges built. The work done in the different districts was as follows:—

DISTRICT A.—Moncton to New Brunswick-Quebec boundary, 256.61 miles. Grading completed, 256.4 miles, or 99.5%; track laid, 256.4 miles; telegraph lines strung, 253.1 miles; bridges completed, 99.9%.

DISTRICT B.—New Brunswick-Quebec boundary to east abutment of Megiskaw river bridge, 578.19 miles. Grading completed, 462.6 miles, or 80%; track laid, 445.5 miles; telegraph lines strung, 286.6 miles; bridges completed, 97.5%.

DISTRICT C.—East abutment Megiskaw River bridge to Quebec-Ontario boundary, 121.94 miles. Grading completed, 77.7 miles, or 63.3%; track laid, 77.7 miles; telegraph lines strung, 24.7 miles; bridges completed, 27.2%.

DISTRICT D.—Quebec-Ontario boundary to 204 miles west of Cochrane, 276.11 miles. Grading completed, 264.6 miles, or 95.8%; track laid, 239.4 miles; telegraph lines strung, 144.2 miles; bridges completed, 95.5%.

DISTRICT E.—Mileage 204 west of Cochrane to 125 miles east of Lake Superior Jct., 195.19 miles. Grading completed, 154.8 miles, or 79.3%; no track laying, telegraph line or bridge work done.

DISTRICT F.—From 125 miles east of Lake Superior Jct. to Winnipeg, 375.90 miles. Grading completed, 371.6 miles, or 98.9%; track laid, 359.7 miles; telegraph line strung, 274.2 miles; bridges completed, 91%. (Feb., pg. 82.)

R. W. Leonard, Chairman, N.T.R. Commission, at a dinner given in his honor at Brantford, Ont., Jan. 30, after referring to the inception of the project, stated that the line in the Maritime Provinces went through a splendid agricultural country, and there was also a large area of good agricultural land in Quebec and Ontario, particularly in the clay belt of Ontario. There also was a large area of rocky country, the mineral value of which it was difficult at present to say. The whole country through which the line passed was capable of great development. The building of the line was a work of great magnitude, stretching as it did between two cities 1,804 miles apart, and crossing rivers which necessitated the building of 243 bridges of large size, in addition to the Quebec bridge, which, when completed, would have the longest span of its kind in the world.

Grand Trunk Pacific Railway Construction, Etc.

A deputation from Port Arthur, Ont., waited on the Dominion Government, Jan. 31, to discuss the entrance of the G.T.P.R. into that city. The matter has been under discussion for a long time, and the citizens are anxious that the connection be secured as soon as possible.

A contract has been let for the construction of an additional unit to the

elevator at Fort William, Ont., operated by the Grand Trunk Pacific Terminal Elevator Co., to the John S. Metcalf Co., Montreal. The addition will be of concrete, with 2,500,000 bush. capacity, making the total capacity about 5,750,000 bush. The estimated cost of the addition is \$500,000.

E. J. Chamberlin, Vice President and General Manager, is reported as having stated that a start has been made in laying out the company's yards on the acreage secured at Springfield, outside Winnipeg. It is said to be the intention to run all freight trains through Winnipeg to Springfield on a loop line across from the west, the plans for which will be announced, he expected, shortly. A large amount of work has yet to be done in and around the union station, and as soon as this is finished the present temporary tracks will be done away with, and the space taken up by them will be used for other purposes. It is expected that this work will be finished during the summer.

Replying to questions in the Saskatchewan Legislature, Feb. 2, the Minister of Railways said the G.T.P.R. had completed the grading of 133 miles of the branch line from Regina southerly, and the company's engineer had advised him that rails had been purchased for these lines. The route of the line had been approved to the International boundary near Frobisher.

Application is being made to the Saskatchewan Legislature to incorporate the Grand Trunk Pacific Saskatchewan Ry. Co. to build the following lines:—From tp. 9 or 10, range 13 west of the second meridian to Weyburn, thence southwesterly and westerly to the western boundary of the province between tps. 2 and 5. From tp. 16, range 19, west of 2nd meridian, southwesterly, effecting a junction with the previously mentioned line. From Saskatoon westerly and northwesterly to Battleford. From Watrous southwesterly through Swift Current to the International boundary between ranges 23 and 30, west of the third meridian. From Melville to Watrous. From Saskatoon southeasterly to Regina. From tp. 36, range 8, west of the 3rd meridian, southwesterly and westerly to a junction with the G.T.P. Branch Lines Co.'s Biggar-Calgary branch. The bill also provides that such other lines may be built as are authorized by the Lieut.-Governor in Council.

The Board of Railway Commissioners has approved of revised location plans of the G.T.P. Branch Lines Co. Cutknife branch from mileage 31.86 to 55.84, Sask.

The Premier of Alberta, in laying before the Legislature the Government's railway policy recently, said it included the guaranteeing of G.T. Pacific Branch Lines Co.'s lines for \$20,000 a mile for a line southerly for 58 miles from the G.T.P.R. main line for the purpose of opening up an extensive coal mining area. An extension of time for a year for the completion of the lines under construction, for which the Government had guaranteed the bonds, would be granted by additional legislation.

On the main transcontinental line track has been laid to near Moose Lake at about mileage 28 west of the B.C. boundary, and about 56 miles west of Fitzhugh, Alta., to which point a train service is being operated. Supply trains are being operated to the track end, the freight then being carried overland to Tete Jaune Cache to await the opening of navigation for transshipment on the two steamboats which are being put together on the river. E. J. Chamberlin, V.P. and G.M., returned to Edmonton from a trip of inspection as far as Tete Jaune Cache, Jan. 31, and stated that he expects to see the track laid to that point

early in June. Construction is to be gone on with from Fort George both east and west, and good progress is reported to have been made on the rock work easterly of Kitselas. Track has been laid to the mouth of the tunnel 104 miles east of Prince Rupert, and the work will be resumed as soon as it is possible to get sufficient continuous grading ahead.

A permit has been taken out in Vancouver by the company for an overhead bridge across the C.P.R. tracks at the foot of Main St. to the docks. These docks are rapidly approaching completion, and it is expected that a start will be made early in the spring on the office building.

Capt. Nicholson, Manager, G.T.P. Coast Steamship Co., is reported as having stated in Victoria that plans are ready for the building which the company proposes to erect on Wharf St. in that city for office purposes, and that a contract will be let for its erection as soon as he receives advice from headquarters.

The company is carrying out a policy of building hotels at central points along its system. The work on the Fort Garry Hotel, Winnipeg, is being pushed rapidly; plans are being prepared for an hotel at Edmonton, Alta., and for hotels at Miette Hot Springs and in the vicinity of Mount Robson, in the Rocky Mountains, and contracts are being let for the hotel at Prince Rupert.

The company, in its general operations, proposes to open up during the current year 57 new townsites, and it has been announced through the Transcontinental Townsite Co., that a contract had been entered into for the building of 25 general stores in various towns along the line. (Feb., pg. 82.)

Grand Trunk Pacific Railway Construction Programme for 1912.

We are officially advised of the following construction programme for the current year:—

MAIN LINE.—Grading is proceeding between mileage 29, west of the Yellowhead Pass and Fort George, B.C., 205 miles, and between Hazelton and Fraser Lake, B.C., 200 miles. Grading up to these points, viz.: from Wolf Creek, Alta., westerly to mileage 29, west of the Yellowhead Pass, and from Prince Rupert easterly to Hazelton, B.C., has been completed.

Tracklaying is completed on the Mountain Division from Wolf Creek westerly to mileage 29, west of the Yellowhead Pass, 158 miles, and further work on track is being held up pending the finishing of certain heavy work between mileage 29 and 50 (Tete Jaune Cache). This will be proceeded with in the spring, and it is expected to lay 150 miles. At the Pacific end of the Mountain Division track has been laid from Prince Rupert to mileage 121, and is now proceeding. It is expected to lay continuously to Aldermere, 235 miles east of Prince Rupert. Further tracklaying beyond this point will not be continued until the latter part of this season.

BRANCH LINES.—The following branches under construction last season, are to be completed this:—

Brandon branch from Harte to Brandon, 24 miles.

Regina-Boundary branch from Regina southeasterly, 155 miles.

Regina to Moose Jaw, 40 miles.

Moose Jaw, northwest, 75 miles.

Prince Albert branch from Young to Prince Albert, 111.5 miles, 67 miles already completed.

Battleford branch, from Oban to Battleford, 48 miles.

Cutknife branch, from Battleford westerly, 50 miles.

Biggar-Calgary branch, from Biggar southwesterly, 104 miles.

Tofield-Calgary branch, 202 miles; 107 miles already completed.

Calgary to Lethbridge branch, 111 miles.

Alberta Coal branch, 56 miles, 31 miles already completed.

IMPORTANT WORKS.—Among the most important works to be carried out are an addition to elevators at Fort William, Ont.; freight shed and local freight yards at Edmonton, Alta.; yards and terminals at Fitzhugh, Alta.; Regina, Sask.; Mirror, Sask., and Calgary, Alta.

Railway Finance, Meetings, Etc.

Canadian Pacific Ry.—A dividend of 2% on the preference stock for the half year ended Dec. 31, and a dividend of 2½% on the common stock for the quarter ended Dec. 31, payable April 1 to stockholders of record on Mar. 1, have been declared. The dividend on common stock is payable as to 7% per annum out of revenue, and as to 3% per annum from interest on proceeds of land sales and other extraneous assets.

Notice has been sent to the shareholders subscribing to the issue of \$18,000,000 of common stock, that, in addition to the \$30 a share already paid, payments are due as follows:—\$30 per share on April 12, June 14, Aug. 16, and Oct. 18.

Dominion Atlantic Ry.—Approximate gross earnings for Jan., passenger \$32,300, freight \$54,900, total \$87,200, against \$47,500 total gross earnings for Jan., 1911.

Grand Trunk Ry.—Application is being made to the Dominion Parliament for authority to acquire and deal with bonds and debentures issued or to be issued by the G.T. Western Ry., not exceeding \$30,000,000. Power is also asked to issue \$250,000 of G.T.R. 4% consolidated debenture stock to aid in the financing of any companies now or hereafter to be incorporated, the controlling interest of which is held by the G.T.R. or the G.T. Pacific Ry., or in the name of trustees for either of these companies.

Grand Trunk Pacific Ry.—Application is being made to the Dominion Parliament to authorize a further issue of perpetual or terminable debenture stock not exceeding \$5,000,000, for the purpose of completing the railway, the building of branch lines, the purchase of rolling stock, and the company's general purposes.

Intercolonial Ry.—An Ottawa press dispatch Feb. 9, says the receipts for the current financial year which ends Mar. 31, show to Jan. 31, an increase of \$600,000 in excess of those for the corresponding 10 months of 1909-10. There will be an increase in the expenditure, as it is estimated the increase of wages given the employees will amount to over \$400,000.

Kingston and Pembroke Ry.—Press reports state that the C.P.R. is negotiating with the holders of the minority stock with a view to securing the complete ownership of the line.

Lake Champlain and St. Lawrence Jct. Ry.—A meeting of shareholders will be held in the C.P.R. offices, Montreal, Mar. 4, for the purpose, among other matters, of authorizing the issue of certificates of capital stock to the shareholders.

The Minneapolis, St. Paul and Sault Ste. Marie Ry. has sold to W. A. Read and Co. an issue of \$1,500,000 first consolidated 4% bonds, interest guaranteed by C.P.R. The bonds have been offered to the public at 97½.

New York Central Lines.—A lease and agreement between the Guaranty Trust Co., of New York, and the New York Central and Hudson River Rd., the Lake Shore and Michigan Southern Ry., the Michigan Central Rd., and the Cleveland, Cincinnati, Chicago and St. Louis Rd., has been deposited with the Secretary of State at Ottawa. The Canadian lines affected are the Canada Southern Ry., the Toronto, Hamilton and Buffalo Ry. (as to the interests outside the C.P.R.), and the Ottawa and New York Ry.

Perc Marquette Rd.—The Saginaw board of trade has petitioned the Attorney General of Michigan to take action against the P.M. Rd., in the interest of the shareholders and the public. The petition alleges that the company is insolvent, because of the high rate of interest paid on its obligations, which are said to have increased by \$20,000,000 within the last four years; that the line is not being properly maintained, and that it is unable, therefore, to properly serve the transportation needs of the State.

The P.M. Rd. owns the Lake Erie and Detroit River Ry. in Canada, and runs its train through between St. Thomas, Ont., and Buffalo, over the Michigan Central Ry. It also operates, through the L.E. and D.R. Ry., the London and Port Stanley Ry.

Rutland Rd.—Application is being made to the New York State Public Service Commission in the interests of the minority stockholders of the Rutland Rd. with a view of compelling the New York, New Haven and Hartford Rd. to purchase their stocks at the same price it is paying the New York Central and Hudson River Rd. for the majority stock. The Rutland Rd. Co. owns the Rutland and Noyan Ry. in Canada.

Victoria and Sidney Ry.—The British Columbia Courts, Jan. 30, refused to grant an order, asked for by the Victoria city council, for sequestration. The difficulties between the city and the company are of long standing, and if a settlement is not made in the meantime, the matter will again come before the court in July.

Wabash Rd.—A bill for the foreclosure of a mortgage for \$40,000,000 on the Wabash Rd., held by the Equitable Trust Co., New York, as trustee, was reported to have been filed in Detroit, Mich., Feb. 16. Interest on the mortgage bonds amounting to \$812,000 was due Jan. 1, which indebtedness is admitted by the company. F. A. Delano, W. K. Bixby and E. B. Pryor, St. Louis, were appointed receivers, and were given permission to issue receivers' certificates aggregating \$10,000,000 for the benefit of the property.

Wisconsin Central Ry.—An issue of \$3,500,000 of first and refunding 4% mortgage bonds, due 1959, is being placed on the London, Eng., market at 89. The W.C. Ry. is controlled by the Minneapolis, St. Paul and Sault Ste. Marie Ry., which in its turn is controlled by the C.P.R. It is reported that about 90% of the issue has been taken up by the underwriters.

Alberta and Great Waterways Ry.—The Premier laid before the Alberta Legislature, Feb. 8, a statement of the claims made in connection with the cancellation of the contract for the building of this railway. The filed amount is \$3,190,001.29, of which \$2,500,000 is claimed by the construction company, \$372,648.16 by the Royal Bank, and \$317,353.13 for goods supplied and services rendered, for grading work done, claims against sub-contractors, damages for breach of contract, and for money advanced or promised for special services. A number of the claims are duplicated and this will be thoroughly investigated. No details are given as to how the two largest claims are made up.

Canadian Northern Railway Construction, Betterments, Etc.

The St. Charles and Huron River Ry. Co. has been incorporated by the Quebec Legislature. The route proposed starts from the Quebec and Lake St. John near St. Ambrose de la Jeune Lorette to the Huron River in St. Edmond of Stoneman, about eight miles. The provisional directors are W. S. Barclay, F. M. Spaidal, W. A. Kingsland, and L. A. Cannon. Quebec, the first three of which at least are Canadian Northern Ry. officials. The proposed line is a direct off-shoot of the Quebec and Lake St. John Ry., and is projected to bring traffic to the main line in the shape of summer residents and pulpwood.

It will run up the St. Charles river from Lorette and tap St. Charles and a very pretty country in the Laurentian mountains. The construction will be easy throughout. (Jan., pg. 23.)

Montreal Terminals.—The purchasing of land near Montreal and in the city in connection with the proposed tunnel and terminals, continues. A good deal of this is for C.N.R. purposes. The land not directly required for right of way and terminal purposes has been acquired by syndicates for disposal to industrial concerns, and for residential purposes. Plans have been prepared for laying out the new town at the back of the mountain, and it is stated that development work will be gone on with during the summer.

The general plans for the terminal station are being considered by the Montreal city council.

The financing of the project is reported to have been arranged, and that an issue of \$7,500,000 of bonds having been taken by J. P. Morgan's London, Eng., house.

Montreal-Port Arthur Line.—The work on the line, which is to give a direct route from Montreal to Ottawa, is expected to be finished this year. The line which is being built by J. P. Mullarkey, runs from the portal of the proposed tunnel under Mount Royal to near Hawkesbury, Ont. The cold weather has somewhat delayed bridge construction, but it was reported, Feb. 15, that the piers and abutments of the bridge from St. Eustache to Ile Jesus were practically finished, and that the work on the piers and abutments of the bridge from Ile Jesus to Montreal Island would be started early in the spring.

The line from near Hawkesbury to Ottawa is already in operation. In connection with the question of the entrance of the company's several lines into the centre of Ottawa, Sir Wm. Mackenzie is reported to have said that he had had several conferences with the Dominion Government and city authorities, and that a complete settlement of all the points is expected at an early date.

West of Ottawa J. P. Mullarkey has a contract for building about 90 miles to Pembroke. The route crosses the Ottawa River at Fitzroy harbor, near the Chat Rapids, and follows the river in the province of Quebec as far as Portage du Fort, where it crosses to the Ontario side, and proceeds on to Pembroke. The piers and abutments of the two bridges, 2,600 ft. and 1,200 ft. long respectively, are being built.

Protests are being made by citizens of North Bay against the route of the line through the town which has been approved, and the matter was discussed by the town council, Feb. 15, when the agreement came up for ratification. The council declined to ratify the agreement, and decided to ask the Board of Railway Commissioners to decide as to the route.

The Board of Railway Commissioners has approved of location plans for the line through Nepean, March and Tarbolton tps., mileage 14.3 to 27 from Ottawa; through Ross, Westmeath and Pembroke tps., mileage 67 to 83.45 from Ottawa; through Springer, Field, Badgerow, Gibbons and Crerar tps., mileage 366 to 386 from Montreal, and through unsurveyed territory in Algoma district, mileage 327 to 343.15 from Sudbury Jct., Ont.

Canadian Northern Ontario Ry.—The Board of Railway Commissioners has authorized the company to build a line from Stanley St., Trenton, to the railway bridge across the Trent river, to connect the Central Ontario Ry. with the company's Toronto-Ottawa line. The Commissioners have also authorized the opening for traffic of the line from Harrowsmith to Sydenham, mileage 160.50 to 163.60 from Don Jct., Toronto. From Sydenham to Ottawa the line is under contract, and considerable progress has been made with the grading. It is expected that track will be laid over it by Dec. 31.

The plans for the company's line across North Toronto are being worked out, as also are the plans for the line from Toronto to Hamilton and Buffalo. Several surveys have been made through Hamilton and the Niagara peninsula, and plans have been filed. Those for the line through Hamilton were filed Feb. 22, but have not been approved.

Press reports stated recently that the company was considering plans for a line to Kincardine, Ont. We are officially advised that while at some distant date such a line might be built, the company is not considering it at present.

Canadian Northern Ry.—Speaking in a general way at Winnipeg, Jan. 29, on his way back to Toronto from the Pacific coast, Sir Wm. Mackenzie is reported to have said that the company has in contemplation the spending of \$25,000,000 on construction west of the Great Lakes this year. Work on the branch lines in the prairie provinces will be pushed in all directions as far as men and materials can be got. The building of a second track from Port Arthur to Winnipeg will have to be undertaken very shortly. A large stretch of the main line between Edmonton and Port Mann will be completed during the year. Several miles of steel had been laid at either end, and it is hoped to get steel laid to the Yellowhead Pass from the east, and to Kamloops from the west, by the end of the current year. The main line from Winnipeg to the coast will be completed by the end of 1914.

In connection with the press reports that additional storage facilities are to be provided at Port Arthur in time for handling the crop of the current year, we are officially advised that nothing definite has been decided on.

We are officially advised that the betterments to be undertaken during the current year include the completion of the fill across Rainy Lake, a solid rock bank wide enough to permit of the laying of a double track; the increase of yard accommodation at Port Arthur, Rainy River, Winnipeg, Dauphin, Saskatoon, and Edmonton; building passing tracks at a large number of places along the entire line; the building of station and section houses at various points on the line; a considerable amount of ballasting all along the line; and the replacing with 80 lb. steel of a considerable mileage of the track between Portage la Prairie, Man., and Kamsack, Sask.

In an interview at Winnipeg, Feb. 15, M. H. MacLeod, General Manager and Chief Engineer, is reported to have said that the work of reducing the gradient on the line from Winnipeg to Fort Frances to 0.4% will occupy a lot of attention this year. There is no intention of

double tracking the line as yet, but the bridges on the route will be made ready to carry a second track. The work of grade reduction and general betterment is about completed between Port Arthur and Fort Frances.

In an interview a few days previously Mr. MacLeod is reported as having stated that several miles of tracks would be added to the yards at Fort Rouge, but that nothing definite had been arranged in regard to a suggested new yard east of Winnipeg.

Sir Wm. Mackenzie is reported as saying that a project is under consideration for building a cut-off from Morris to Vita, so as to enable traffic from southern Manitoba to be handled without going through Winnipeg, but that it is still in the future. In connection with this project, press reports state that surveys are being made for a line from near Portage la Prairie, via Culross and Sperling, to Morris, the construction of which would enable through freight from all parts to be hauled to Port Arthur without going into Winnipeg.

The Board of Railway Commissioners has authorized the opening for traffic of the line from Grosse Isle, Man., to the end of track, 31 miles.

Application is being made to the Saskatchewan Legislature to incorporate the Canadian Northern Saskatchewan Ry. Co. to build the following lines of railway:—From Kipling westerly to New Warren; from Lampman northerly to a junction with Brandon-Saskatchewan line of the C.N. Ry.; from Moose Jaw easterly to Regina; from the Delisle branch to the western boundary of the province; from Chamberlin southerly to Moose Jaw; from Craven northeasterly to Hudson Bay Jct., with a branch to near Yorkton on the C.N.R. Rosburn branch; from Humboldt westerly to Saskatoon; from Langham southeasterly to Saskatoon; from Melfort northeasterly, to the eastern boundary of the province; from Hudson Bay Jct. southerly, to near Maryfield, on the C.N.R. Brandon-Regina line, from Swift Current northerly to Battleford; from Chamberlin westerly and north of the North Saskatchewan River to the western boundary of the province; from Prince Albert northeasterly to the eastern boundary of the province; from the C.N.R. Prince Albert-Denholm line to the C.N.R. North Battleford-Jackfish line; from near Moosomin to the southern boundary of the province; and also such other lines as are authorized by the Lieut.-Governor-in-Council.

The Board of Railway Commissioners has authorized the opening for traffic of the Rosburn extension from Hamilton to a connection with the Edmonton line east of Canora, Sask., 15 miles.

Tenders were received to Feb. 23 for building the substructure for a subway under the company's railway on 23rd Street, Saskatoon. The work is being done jointly by the company and the city council.

We are officially advised that the company is not making a survey for a line from Bruderheim to Medicine Hat, Alta., as press reports state.

We are officially advised that the construction programme for the year had not yet been definitely settled. It is expected, however, to grade and have track laid on the main line from Edmonton to Yellowhead Pass by the close of the year, in addition to the work going on in British Columbia, which is referred to further on. It is also expected to complete the line between Vegreville and Calgary, Alta., and the line between Alask and Munson, Alta. This latter will give the company a through line from Saskatoon to Calgary. The line to the Brazeau coal fields, 170 miles, is also expected to be completed this year.

The proposals for aiding railway

building in Alberta, as stated in the Legislature by the Premier recently, provide for the guaranteeing of Canadian Northern Western Ry. and C.N. Ry. bonds for 1,405 miles of line, but as the guarantees in respect of 150 miles are revotes of former votes, the new mileage guaranteed is 1,255. The guarantees are at the rate of \$20,000 a mile in respect of 250 miles; at the rate of \$15,000 a mile in respect of 415 miles (150 miles being revotes of former guarantees); and at the rate of \$13,000 a mile in respect of 640 miles. The lines covered by these guarantees are as follows:—Peace River line from Onoway towards the Peace River, 250 miles; from Athabasca Landing for 100 miles in the direction of Peace River; from Athabasca Landing to Fort McMurray, 175 miles, and a branch line therefrom to Lac la Biche, 40 miles; from north of the Saskatchewan River towards St. Paul de Metis, 100 miles; from south of the Saskatchewan River through Bruderheim to the western boundary of the province, 200 miles; from west of the Calgary and Edmonton Ry. to the west of Pigeon Lake, 100 miles; extension of the Brazeau line southeasterly to the C.N.R. Goose Lake line, 130 miles; extension of the line from Camrose for 80 miles; from Calgary, east of the Calgary and Edmonton Ry., 100 miles. Under the C.N.R. the guarantees will be given for the extension of the Goose Lake line from the eastern boundary of the province to the junction with the Vegreville-Calgary line at the crossing of the Red Deer River, 130 miles. The C.N.R. and its subsidiary companies has under construction in the province 957 miles of railway, including 253 miles of the main line west of Edmonton. Of these lines, 742 miles have been graded, including 150 miles of the main line, and 380 miles of track, including 35 miles on the main line, has been laid. There is therefore about 600 miles graded and ready for tracklaying, and that mileage can be got ready for operation this year. Of the lines on which track has been laid, 207 miles have been placed in operation. It is expected to have the lines already guaranteed and partly constructed, as well as the whole of the lines now to be placed in operation within four years. The company will be given, under extra legislation, an extension of time for the completion of the lines under construction for which the Government has guaranteed the company's bonds. The acts giving effect to the guarantees have been passed by the Legislature.

A press dispatch Feb. 5, stated that track had been laid into Athabasca Landing, and that it would take a month to finish up the work on the branch.

Canadian Northern Pacific Ry.—The British Columbia Minister of Railways informed the Legislature recently that the C.N.P.R. Co. had deposited with the department plans and profiles of its railway, as required, and that the same had been approved. The maximum gradient on the mainland is 0.4%, and on Vancouver Island 1.50%. The maximum curvature is 10 degrees, and the minimum 0.30 of a degree.

Tracklaying on the line from Port Mann easterly was reported to have reached Chilliwack, Feb. 10. The building of the bridge over the Coquihalla River near Hope was started Feb. 1. G. Brant being engineer in charge. The grading and other work on the line easterly from Hope is making rapid progress, and it is expected to have track laid to Kamloops by the end of the year.

Press reports state that engineers are making surveys for a branch line from Kamloops to Vernon, about 80 miles, and that A. E. Ashcroft is in charge of the party working out of Vernon. Mr. Ashcroft is understood to be making

surveys for the Coteau Power Co.'s line, an electric project, which Mackenzie, Mann and Co. have acquired control of.

Vancouver Island—In an interview at Victoria, on the occasion of his recent visit, Sir Wm. Mackenzie is reported as stating that the grading on the first 35 miles of the line out of Victoria is practically completed, and that the work on the rest of the 100 miles is under way. Arrangements are reported as being made to secure ferry terminals on the island as well as on the mainland. (Feb., pg. 74.)

Grand Trunk Railway Betterments, Construction, Etc.

Central Vermont Ry.—E. H. Fitzhugh, President, C.V. Ry., and other officers are named as provisional directors of the Barre Granite Ry., a company incorporated in Vermont State to build a line of 10 miles from Barre, Vt., to a connection with the C.V.R. at Williams-town, Vt.

New England Proposals—The Southern New England Ry., Feb. 8, invited bids for the building of the line from Palmer, Mass., to Providence, R.I. Contractors are asked to submit prices for the completion of everything in connection with the extension of the line, the work to be completed by Dec. 31, 1913. The company is applying to the Massachusetts Legislature for authority to build the following lines:—from Windsor, Vt., to Boston; from Boston to Blackstone, and from a point in Douglas county to Worcester, Mass. The authorities in control of Boston harbor propose to expend \$50,000,000 upon its improvement in order to provide for the increasing business and to facilitate the entrance of the new line.

Lachine, Jacques Cartier and Maisonneuve Ry.—The Board of Railway Commissioners has approved of the location of this line from 40 ft. west of the C.P.R. crossing at Iberville St. to the terminal at St. Catherine St., Montreal, through C.P.R. lands, subject to an agreement between the two companies.

Montreal Grade Revision.—The proposed grade revision in Montreal continues to be discussed by the city board of control, as well as by local representative bodies. Deputations representing St. Henry, Ste. Cunegonde and St. Joseph wards waited on the board of control recently and argued in favor of the depression of the tracks instead of their elevation in the city.

East Toronto Yards.—The company is reported to have purchased a large area of land between Carlaw and Boston Avenues, east of the Don, from the Toronto city council and other owners for yard purposes.

Orillia, Ont.—We are officially advised that the press reports stating that a site had been purchased in Orillia on which to erect an office building, and that a new station would be built opposite the C.P.R. station at Mississauga St. in that town, are without foundation.

West Toronto to Weston.—A press report states that it is proposed to lay a second track from West Toronto to Weston during the present year, and that the possibility of building a second track right through to Sarnia is being considered.

Hamilton, Ont.—Press reports state that there is every reason to believe that the plans for the new station in Hamilton will be submitted to the city council at an early date. The City Engineer states that the plans, when submitted, will provide for a station on Ferguson Ave., between King and Barton Streets.

St. Catharines, Ont.—A deputation from the city council waited on G.T.R.

officers at Montreal, Jan. 30, with regard to the proposed high level traffic bridge over the old Welland canal on the road to the G.T.R. station, and also about the proposed new station at St. Catharines. The cost of the bridge is estimated at \$175,000, and the city is asking the company to contribute \$50,000 towards its construction. The Chief Engineer promised to visit the city and look into the project early in March. The deputation was informed that the company had under consideration a plan for building a spur from the main line to the northern section of the city to connect with the Welland division line.

Port Colborne, Ont.—Press reports state that the company has leased from the Dominion Government all the Government land lying between the G.T.R. Welland line and Welland St., and is purchasing adjoining lands. The land, it is said, will be used for yard and station purposes.

International Bridge.—We are officially advised in connection with the press report that the International bridge at Black Rock was about to be rebuilt; that during 1911 the portion of the bridge over the Black Rock harbor was replaced, owing to improvements being made in the channel by the U.S. Government, and that at present the company is not considering the replacement of the bridge. (Feb., pg. 85.)

Automatic Signals on the Canadian Pacific Railway.

The C.P.R. has placed an order for automatic block signals to equip 192 miles of line, including about 33 miles of double track. This is probably the most extensive installation of automatic signals in Canada. The terminal of the sections to be signalled are as follows:—

St. John, N.B., to Vanceboro, Me., 90.25 miles single track.

Brigham Jct., Que., to Montreal Jct., 34.5 miles single track and 9.5 miles double track.

Place Viger, Montreal, to Ste. Therese, Que., 20 miles double track.

West Toronto to Bolton, Ont., 21.6 miles single track.

Islington to Streetsville, Ont., 12.9 miles single track.

Romford Jct. to Sudbury, Ont., 3.2 miles single track and 3.8 miles double track.

The Hall Signal Co.'s style K top post signals, with the arms working in the upper quadrant and three positions, will be used, and the work of installation will be begun in the spring after the frost is out of the ground. On the C.P.R. the night signal colors are green for proceed, yellow for caution and red for stop. The signals will be arranged to stand "normal danger," and the apparatus and construction will conform to the specifications of the Railway Signal Association.

Papers on Transportation.—Collingwood Schreiber C.M.G., General Consulting Engineer for the Dominion Government and Chief Engineer, National Transcontinental Ry. Western Division, read a paper, "A short sketch of the development of transportation facilities in Canada" before the Canadian Society of Civil Engineers in Montreal, Feb. 8. At the same meeting A. Surveyer read a paper on the cost of transportation by land and water.

Vancouver Branch Canadian Society of Civil Engineers.—At the annual meeting, Feb. 4, the following were elected officers for the current year:—Chairman, C. E. Cartwright; executive committee—J. C. Kennedy, L. G. Robinson, H. P. Archibald; Secretary-Treasurer, W. A. Kennedy. The branch has a membership of over 100.

Electric Railway Department

Steel Body Cars for the Montreal Tramways Company.

The Montreal Tramways Co. is having a series of steel-body cars built to the designs of D. E. Blair, Superintendent of Rolling Stock. The first of these cars, shown in the accompanying fig. 1, was delivered about the beginning of the year by the Canadian Car and Foundry Co.

In general appearance they closely resemble the last series of cars built for the company, the principal point of difference lying in the careful design which has in view the elimination of as much weight as possible without at the same time decreasing the strength. This feature has been successfully accomplished, a considerable saving in car weight being obtained with a stronger and more substantial car.

The elimination of excessive weight in street car design has been made a subject of exhaustive study by Mr. Blair. He partially bases his claims for more attention to weight reduction on the fact that "careful investigation would seem to indicate that the cost of maintenance of car equipment is in direct proportion to the total weight of the car, and there is every reason to believe that the wear and tear of track and roadway increases to an equal ratio. This is especially so if the car weights have increased beyond the capacity of the older roadbeds and rails, and it has been deemed advisable to replace a soft and resilient rail foundation with a hard, unyielding bed of concrete in direct contact with the rail." This subject was thoroughly treated by him in a paper read at the Canadian Street Railway Association's annual meeting in 1910 and published in *The Railway and Marine World* for Sept., 1910, from which the foregoing extract is taken.

He went on further to show from deductions made on other roads that taking the conservative figure of 5 cts. for the operating cost per lb. of car per year, it would be a paying investment for any road to pay \$1,000 for every one-ton reduction in car weight. Under operating conditions not as favorable as that just cited, an even greater premium might profitably be paid for weight reduction. This alone is based on the cost of power as produced, neglecting the fact that all power saved means a greater operating capacity for a given plant, without further power plant additions. This inci-

dentally relieves much capital from being tied up in this manner.

A marked advance in car weight reduction has been accomplished in these cars. The former cars of exactly similar general size and seating capacity—to seat 40—weighed complete 53,000 lbs. The cars of the new 1,200 series here to be described weigh 44,000 lbs., a saving of about 9,000 lbs. So much, in fact, has the body weight been reduced that the truck manufacturers were willing to supply a size lighter truck than those used in the last cars, it being felt that these new cars were sufficiently light to warrant their use as safely as the heavier truck with the old design. Other savings might be had were the equipment-

two being the big desiderata.

manufacturers as interested in weight reductions as the operating companies. More mention will be made of this later.

FRAME.—The main point of design towards weight elimination, lay in the careful and studied design of the car frame, to place the members just where they will do the most good, and at the same time make a careful selection of those shapes which are of such inherent construction as to increase the strength of the general design with the use of less metal. To further quote Mr. Blair:

If a thicker sill plate could be employed, as a natural consequence it would not have to be as deep for a given strength when acting as a beam. What was even more important, narrow plates could be secured from the mill in sheets of such length as to require no splicing. This, combined with the fact that a heavier plate is less subject to injury from side blows, led to the adoption of a shallower but thicker plate, the depth only being about half that used in the former design. This girder is the nar-

Fig 1—Steel Body Cars for the Montreal Tramways Co.

"There has been no limit set to the weight of car, and the builder finds it more convenient, perhaps on account of limited shop facilities and perhaps because it is cheaper, to use standard commercial shapes and dimensions where a lighter shape of better design would have done as well."

The essential part of the design upon which all the rest of the design depends, is that of the girder plate. This new design is shown in fig. 2. In the former

row strip between the two black lines at the bottom of the car body, as seen in fig. 1. The construction of this supporting girder plate is shown in fig. 2, which also shows one of the needle beams.

This girder plate, as fig. 2 shows, is a composite member, built up so as to resemble in qualities an I-beam girder. A $\frac{1}{4}$ -in. web plate, 18 ins. deep, is secured by a single row of rivets to a heavy $4 \times 2 \frac{1}{2} \times \frac{1}{2}$ in. ship channel at 13.6 lbs., in the manner indicated. This forms the tension member of a built-up girder. At the top of the web plate a composite member is built up, composed of a bar section, and a special Carnegie section of such a shape as to have the outside rivets come below the surface. This composite section forms the upper member of the girder. The upper, or compression member, is further reinforced for a distance of 5 ft. from the rear end by the addition of a $3 \times 7-16$ in. plate as shown in the illustration. Such a construction constitutes a strong, light, rigid girder, in various ways superior to the old design. This girder runs the full length of the car body, following the corner curvature at front and rear vestibules, producing a strong corner construction for the withstanding of shocks.

Particular emphasis might be drawn to the fact that while weight reduction was one of the great desiderata, the main factor kept in mind throughout the design was to produce a car both strong and rugged in design, yet light, which would still be proof against the many abnormal bumps and consequent stresses to which large cars are subjected in crowded thoroughfares.

The balance of the frame, of which these side girders are the principal members, is shown in fig. 3. It is 32 ft. 3 ins. long. The $4 \times 2 \frac{1}{2} \times \frac{1}{2}$ in. heavy channel which forms the tension member of the side girders continues along both sides. The ends, joined to the sides by gusset plates, are $6 \times 1-16 \times 3 \times 9-16 \times 7-16$ in. Z-bars at 18.3 lbs. These sections across the ends are each further reinforced by a $2 \times \frac{1}{2}$ in. truss plate supported on a 12-in. length of 6-in. channel, in the manner indicated. This construction is calculated to make the car body uncol-

Fig. 2—Construction of Girder Plate and Needle Beam.

design a long beam was built up of $\frac{1}{4}$ -in. plate, the depth from belt rail to bottom of car body. It being impossible to secure plates of sufficient size to make the side out of one continuous piece, riveted joints had to be resorted to. This new design dispenses with such a construction.

It was felt that while $\frac{1}{4}$ -in. was sufficiently great, as far as strength alone was concerned, it was not sufficient to withstand all the wear and tear to which the side of a car is subjected, especially in narrow, crowded thoroughfares such as exist in Montreal. Simplicity of repair was also a question of equal importance with that of weight elimination, these

two being the big desiderata.

lapsible from any reasonable end impact, the assumption being that the affected vestibule will crush, leaving the body comparatively free from damage. This is in line with the contentions being advanced by many railway car builders to the effect that vestibule construction should be weak as compared with the balance of the car, acting either as a resilient or collapsible body to protect the main structure.

A front vestibule projecting forward a

beams, as at the front, support the floor.

BODY BOLSTER.—The design of body bolster is rather ingenious, from the fact that the arrangement permits of a very low setting of the car body for a given height of truck. The design is illustrated in the accompanying drawing, fig. 4. As will be noticed, it is constructed of two lengths of channel steel, the upper 12 ins. at 20.5 lbs., and the lower 10 ins. at 20 lbs. Both are placed web upwards.

frame are clear of the body bolster, as shown, the whole weight being carried directly from the built-up plate girder on to the ends of the body bolster. The advantage of such a construction lies in the fact that the floor being unsupported from the body bolster, which is carried on the truck bolster, is freed from the vibration that the truck would otherwise transmit. The life of the floor is thereby increased, and the comfort of the passenger provided for.

Fig. 3—Design of Steel Car Frame and Vestibule Construction.

distance of 5 ft. 7 7/8 ins. is carried on two 6-in. channels at 10 lbs., one at each side, supported from the main frame in the manner indicated in the plan and elevation of the end construction. On the outer end of these channels there is a steel bumper, built up of a 6-in. 10.5-lb. channel and 3-16-in. cover plate.

Intermediate to the outside supporting channels, there are two 6-in. 9-lb. angles for the support of the vestibule floor structure. They are carried at the front by the bumper, and at the rear by the body end Z-bars.

The rear vestibule construction required some very careful designing, on account of the great overhanging weight carried by it. This platform projects back 7 ft. 9 3/4 ins., and from the centre of the back truck to the rear of the platform is over 13 ft. This platform construction would seem to be abnormally large, but is considered advisable for the P-A-Y-E system of fare collection. The design here developed is on the assumption of it being possible to concentrate 30 normal individuals on the extreme rear end of the platform. This condition never existing, the design can readily be seen to be strong enough to meet all requirements. Incidentally it may be mentioned that as light a car construction is not possible with such cars as is practicable on cars with shorter vestibules, owing to the heavy reinforcing necessitated.

The back vestibule is carried on a rather ingeniously designed arrangement of channels in the manner indicated, two 4-in. at 6 lbs. being used on each side. As shown in the sectional view, a 10-in. 25 lb. piece of I-beam acts as a separator directly under the end of the car body end Z-bar, with lighter separators at other places. Extra metal had to be introduced into these overhanging beams, on account of the side offset, to allow for the car steps being inside the outside clearance line. This arrangement, it will be noted, has been well designed, resulting in not only a substantial but clean-cut design. A rear-end bumper, built up of channels and plates, is carried on these overhanging beams. Intervening 6-in. 10-lb. channel

The advantage of such an arrangement is that the upper surface may be brought as close as practicable to the car floor, while the truck bolster centre fits up between the flanges of the lower channel, making the distance between truck bolster and floor a minimum, for a maximum distance of the centres of gravity of the channel sections. This is readily seen from an inspection of the drawing. Such a design of body bolster is a decided improvement on existing patterns for this reason.

The centres of the channels are separ-

The construction of the cross floor beams or needle beams shown in the frame illustration, fig. 3, is shown to better advantage in fig. 2. The construction of these needle beams is quite similar to that of the body bolster, only the lower member is a plain 2 3/4 x 1/4 in. plate strap, the forces acting being reversed. The upper member is a 3-in. channel at 4 lbs. This beam is supported on the lower flange of the body ship channel, the longitudinal floor beams resting on the upper surface of the needle beam.

Fig. 4—Construction of Channel-Beam Body Bolsters.

ated by two short pieces of 8-in. channel sections in the manner indicated. The end connections are made by rivetting the webs together with twenty 3/4 in. rivets, which is amply sufficient to withstand horizontal shear.

The construction of sidebearing plates is indicated in the cross-sectional view of a-b. A flanged piece serves the double purpose of distance piece between compression and tension member of the bolster, the flange securing the circular bearing surface. A Z-bar between the flanges of the lower channel provide additional stiffness to the bearing surface.

Instead of the car body being built up on longitudinal sills supported at intervals across the body bolster, the body frame is made in one unit as previously described, and illustrated in fig. 3, this completed unit being attached to the body bolster by the heavy ship channels along the sides in the manner shown by the dotted channel in fig. 4. The floor and end strengthening beams of the body

BODY CONSTRUCTION.—The first point to be considered in the body construction is the design of posts and belt rail. Two cross-sectional views of the body are shown in fig. 5, while fig. 6 shows some of the more important details on a larger scale.

A casual glance at the three sections to the left in fig. 6 will suffice to emphasize the fact that the wall construction is unusually thin—only 3 7/16 ins., giving a clear inside width of 7 ft. 8 1/2 ins., which is somewhat more than is ordinarily found in cars of similar outside dimensions. To obtain this extra width, very careful design was required.

The weak point usually occurs at the juncture of posts and belt rail, both these members requiring to be recessed in order that they may fit into each other with flush surfaces. This weak point usually necessitates much heavier members in order that the place may be of sufficient strength. A simple modification has here been introduced to make

the post and belt rail construction not only thinner but stronger than usual. The belt rail is recessed on its inner face, similar cut-outs on the outer face of the posts fitting into them. These recesses make the belt rail weak on its inner face, and the posts, on their outer face.

tached by wood screws through holes in the brass-rod fittings, engaging the window sash from the inside, drawing the sash inward. No objectionable and unsightly screw holes are thus left visible when the double windows are removed for summer service. Special precautions

This is clearly objectionable, for from the long unsupported length, unless unduly strong, it will tend to sag at the centre from its own weight. Consequently, in this design, no beam construction has been attempted, the whole weight of clerestory and roof being supported on

Fig. 5—Cross-Sectional Views of the Car Body.

To strengthen the belt rail, a 1/8-in. steel band shown under the wooden strip on the left face of the belt rail in "section of window sill," is attached to the rail belt by screws the full length of the car. The belt rail thus becomes a built up girder, the uncut wooden section forming one member, and the steel strip the other, the resulting beam being stronger than the original wooden rail, as the centres of gravity of the beam members are now further apart. A similar method of strengthening the vertical post is resorted to. A rolled section of shape shown on the right face of the post in "section of vertical post above girder plate," is fastened to the post by screws from the girder plate to roof, resulting in a stronger built-up post than the original wooden one. This is also shown in the upper section. The belt rail thus reinforced will stand a very heavy bending moment.

The design of the vertical posts is simplicity itself. Instead of an ornamented post of varying section throughout its length, a rectangular uniform section is used. Ornamentation is supplied by the attached strips shown in the sections through sashes in the upper left-hand corner of fig. 6. These strips serve the double purpose of guides and decoration, for while extremely plain, their neat lines present an ornamental appearance.

The inner windows are made in two sashes, the upper one of which is stationary. The lower one is opened by raising up into an opening in the upper part of the car, shown in "roof corner details." Double windows, which are also provided, are secured in an excellent manner. As shown in the sections showing "roof corner details," the top of this outer window fits under a holding-in strip. The lower end, instead of being secured by wood screws from the outside screwed into the vertical post, are at-

have been taken that these outer windows fit snugly, for when the intervening space is made air tight, no trouble will be experienced from frosted windows.

the carlines. Protection is provided against the weather at the point at which the carline vertically enters the roof, by encasing the exposed section

Fig. 6—Details of Wall and Roof Construction.

The roof structure is supported on carlines bolted to malleable castings on the heads of the vertical posts, the construction being clearly outlined in the sections in fig. 6. It is customary to construct the roof members on which the clerestory rests, from a heavy beam extending from end to end of the car body.

with sheet metal, and rivetting both top and bottom to the clerestory and roof.

The trolley support is indicated in fig. 5. The whole weight is carried over to the clerestory walls by a trolley board, instead of being supported directly on the clerestory roof. The latter construction is decidedly undesirable from the

thundering noise it creates in the car by the trolley vibration being carried down on to the vibratory roof of the clerestory.

The inner wall of the car between floor and belt rail is lined with 3-16-in. agasote, as indicated both in fig. 5, and the lower left-hand section of fig. 6. The post below the belt rail is encased in the manner indicated in this latter section.

As mentioned earlier in this article, the lower part of the car is well protected against side swipes and knocks on account of the heavy $\frac{1}{4}$ -in. plate construction. Between the top of the plate

The rear vestibule arrangement is the same as heretofore used, a large platform being required for the P-A-Y-E system. The rear rail is to separate the platform standers from those entering, while behind the other rail, the conductor stands. Entrance is through a swinging door, and the rear exit through a sliding door, as shown in fig. 5.

The front vestibule embodies a number of changes on former designs. As before, bulkhead partitions are dispensed with, vertical pipes as indicated, serving a similar purpose of end supports for standing passengers. The motorman is

Ventilation is obtained by an exhaust ventilator. Provision is made for the entry of fresh air by placing small tubes through the floor directly beneath the electric heaters attached to each seat. Fresh air is then drawn through the floor and heated, the foul air being carried away by the ventilators in the deck sash.

As before mentioned, the weight of car body is reduced to such a degree that lighter trucks are possible. This is but one step toward the end desired by certain car builders. Makers of equipment have not seen the need of reducing the weights of the parts they supply, and

Fig. 7—Layout of Car Showing Seating and Vestibule Arrangement.

and the belt rail, there is a zone that while freer from injurious blows than the lower zone, is yet liable to a certain degree of injury. It not being considered advisable to have this section made of heavy plate, a design that called for easily replaceable plates was worked up. Referring to the photograph, fig. 1, it will be noticed that each of the small panels above the girder plate are separate sections of 1-16-in. plate. Reference to the two lower left-hand sections of fig. 6 shows the detail construction. In the lower sections, it will be noticed that this 1-16-in. plate is held at the sides under the edges of the vertical reinforcing strip. To put into place, the thin section is buckled up and slipped under these edges. Referring next to the vertical "section of window sill," the plate is held in position by a rectangular bar slipped up under the outer ornamental band of half-round iron. This rectangular bar is held on by round-head screws. The lower edge of the sheet is secured in place by wood screws through the upper projecting strip shown at the top of the plate girder, fig. 4. These sections it is purposed to keep in stock, all painted, so that in the event of one or more sections being crushed in, all that is necessary is to unscrew the lower row of screws, unscrew and draw down the upper retaining strip, buckle up the plate, which can then be removed. Reversing the operation replaces the damaged plate with one all finished for service. The car is thus only kept out of service the length of time required to replace the damaged section.

The car floor is built up in layers. A sheeting of corrugated iron, rivetted to the floor beams, is covered by a layer of sawdust and magnesite composition. This, strong, flexible, and a good heat insulator is covered with special rubber carpet the size of the car floor, laid in on completion of the composition setting. This composition floor is in line with modern steel car construction.

INTERIOR ARRANGEMENT.—The interior layout of this car is shown in the plan view, fig. 7, and the photograph of the forward end of the car, fig. 8. In the earlier designs of cross-seated cars, this company had cross-seats right up to the front door. Each design since that time has had a gradually decreasing number, the present design calling for only 10 such seats, the balance of space being occupied by longitudinal side seats. The cross-seats used this time are of a new design, rattan seats and backs carried on a pressed-steel frame, the seat complete only weighing 35 lbs.

in a partitioned-off section where he cannot be disturbed by passengers. The exit is at the front of the vestibule, instead of at the rear, as heretofore. A swing door, replacing the former sliding door, is operated by a lever located alongside of the motorman's air handle, the door being mounted on a vertical rod, the lower end of which, under the car floor, is connected to the lever rod just mentioned. The lower rod is so located that on shutting, the rods lock

consequently but little reduction was possible in these parts on this series of cars. A step is now being made by the motor manufacturers to build a lighter motor, weighing about 1,000 lbs. less. This, in a four-motor car such as the one under discussion, will mean a saving of no less than 4,000 lbs. Similar savings are to be expected in other parts when similar careful analysis of the design is dealt with.

Fig. 8—Front Interior Arrangement of Car.

just over the centre of their travel, and so cannot swing open. To provide for a tight, non-rattling door fit, the latter is slightly sprung outward at the top, the closing pressure holding it snugly closed against this spring.

These doors have another point of interest, in the fact that the lower panels are glazed, so that the motorman may observe the movements of the passenger on alighting, and be sure the latter is clear before moving. This is a feature being introduced into most cars that have been recently built.

TRUCKS AND EQUIPMENT.—The trucks are Brill type 27G, each equipped with two Westinghouse 101 motors. Westinghouse straight air system of braking is used, a type D1E motor-compressor supplying the air.

Lake Erie and Northern Ry.—A director is reported to have stated that the right of way between Brantford and Port Dover has all been secured. Brantford city council has given the right for an entrance to the city terminating at the old Great Western Ry. station. It is said that certain municipalities will now be applied to for a guarantee of bonds.

The Hamilton Street Ry., press reports state, has ordered six trucks of the 27 G.I. type.

The Ottawa Electric Ry. has ordered 15 steel body, pay-as-you-enter cars from the Ottawa Car Co., Ottawa, Ont.

The Calgary Municipal Ry. has received four single truck city cars from the Preston Car and Coach Co., Preston, Ont.

Electric Railway Statistics for Year Ended June 30, 1911

The following abbreviations are used in the names of railways—E., electric; E.R., electric railway; E.S.R., electric street railway; Ry., railway; S.R., street railway. The minus mark (—) in the column for net income or deficit, shows that there was a deficit in the operation of the line to the extent of the figures given.

Name of Railway	Mileage	Gross Earnings	Operating Expenses	Miscellaneous Income	Taxes, Interest, etc	Net Income or Deficit	Total Car Mileage	Fare Passengers Carried

Notes to Electric Railway Statistics.

The statistical returns for the operation of the electric railways for the year ended June 30, 1911, are given in somewhat more detail than formerly by the Comptroller of Railway Statistics, J. L. Payne. The accompanying table shows the same information formerly given in these columns in previous years, except that the passenger and freight car mileage has been combined in one column instead of being given separately, and a new column is given showing the miscellaneous income received by the various companies. By deducting the operating expenses from the receipts from operation, the net earnings from operation will be ascertained. Adding the miscellaneous earnings, the corporate income will be ascertained; the next column gives the total deductions from income, and the following column shows the profit or loss.

The various lines carried 111,857,040 transfer passengers, making the total number of passengers carried 538,153,832. Twenty-three of the companies carry freight, the mileage of freight cars for the year being 1,084,678, and the number of tons carried was 2,496,072. Seventeen lines report having 259.74 miles of second track, and there are 103.54 miles of sidings and turnouts, making altogether 1,587.01 miles of track of all kinds laid. Seven companies report as operating over a total of 160.09 miles of leased tracks.

The total length of main track of the electric railways in Canada on June 30, 1911, was 1,224 miles, an increase of 175 miles of first and an increase of 17 miles of second track over the figures for June 30, 1910. The capital liability increased during the year from \$102,044,979 to \$111,532,347. The total earnings for the year were \$20,356,952 and the operating expenses \$12,096,134, leaving net earnings from operation \$8,260,818.

The total number of passengers carried was 426,296,792, against 360,964,876 in the previous year; while 2,496,072 tons of freight were carried. The various railways employed 13,671 persons, to whom \$8,559,215 was paid in wages; the comparative figures for 1909-10 being 10,557 employees and \$6,316,777 wages paid. During the year 102 persons were killed and 2,670 injured on the various lines, against 109 killed and 2,438 injured in 1909-10.

James Anderson, President, Canadian Street Railway Association, and Manager, Sandwich, Windsor and Amherstburg Ry., has been appointed a member of two of the American Electric Railway Association's committees, viz., public relations and permanent membership. He attended the association's mid-winter meeting in New York recently.

Donald Robertson has been appointed Purchasing Agent, Montreal Tramways Co., succeeding W. A. McNaught.

Ottawa Electric Railway Company's Annual Report.

Following are extracts from the report for the year 1911:—

The gross earnings were \$840,680.52, compared with \$748,708.75 in 1910. 19,270,521 passengers were carried, compared with 16,967,334 in 1910. The net earnings were \$354,691.08, which have been disposed of as follows:—

Interest on bonds and loans	\$ 37,031.55
Four quarterly dividends of 2½%, a bonus of 2% and one of 3%, making 15% for the year	187,155.00
Mileage payments	13,667.75
Taxes	8,440.13
Placed to the credit of contingent account to be applied to reduction of track renewal, car equipment and other accounts	78,000.00
Transferred to credit of profit and loss account	30,396.65

\$354,691.08

The balance at credit of profit and loss account is now \$107,355.84, and of rest account \$200,000. The business of the company has practically doubled in six years, the passengers carried in 1905 being 9,891,311, and in 1911 19,270,521.

The new power house was completed towards the end of the year, and the storage battery was renewed. 13,492 ft. of light rails were taken up, and relaid with 80 lbs. tee rails. 8,800 ft. of these were laid in permanent pavement of asphalt and stone blocks. Our office accommodation having become too small, and the space being required for other purposes, a lot has been secured on the south side of Albert St. near Bank St., on which it is proposed to build new quarters as soon as can be arranged. With the great development going on in the city your directors look for marked advances in the company's business as the years go on, and, as in the past, the company will endeavor to provide an up-to-date service.

The statistical tables appended to the report show that the percentage of operating expenses to receipts was 57.6-10 per cent., against 63% in 1910.

The directors and officers for the current year are:—President, T. Ahearn; Vice President, W. Y. Soper; other directors—G. P. Brophy, Hon. G. A. Cox, T. Workman, T. F. Ahearn, E. N. Soper. Secretary, J. D. Fraser.

Toronto Railway Co's Annual Report.

Following are extracts from the report for 1911, which was presented at the annual meeting, Feb. 7, over Sir Wm. Mackenzie's signature:

The operations for the year show very gratifying results. The passenger earnings, \$4,800,467.48, show an increase of \$464,098.43 over 1910. The various charges against these earnings for operation, maintenance, etc., were \$2,653,361.86 or 55.2% of the earnings. The payments made to the city were \$822,233.24, an increase of \$94,752.94, or 13.02% over 1910.

Expenditure on capital account was \$1,113,867.69 for the year. The different works in progress referred to in the report for 1910 were completed and as a result better car-housing facilities now exist at the Lansdowne Ave. car house, and the rolling stock has been increased by about 100 double-truck cars. Track and overhead construction upon various streets has been completed, which has enabled the company to change the routing of several of its lines, thus relieving some of the congestion upon several of the busy thoroughfares in the downtown districts.

The directors subscribed for and purchased at par 20,000 shares of \$100 each of the capital stock of the Toronto Power Co., Ltd., aggregating \$2,000,000.

The shareholders on Aug. 14, 1911, authorized an increase in the capital stock

by \$4,000,000, and there was offered for subscription to the shareholders of record on Aug. 25, 1911, at par, \$2,000,000 of the new stock.

Under the mortgage deed dated Sept. 1, 1892, covering the currency and sterling bond issues, the company is obliged to redeem by drawing annually, 5% of the outstanding bonds. The first drawing was for payment on Aug. 31, 1911. The bonds drawn amounted to \$168,693.33, of which there was presented up to Dec. 31, \$133,413.33, leaving a balance of \$35,280.00 deposited for redeeming the balance.

Careful attention has been paid to the maintenance of the plant, rolling stock equipment and other properties.

The directors declared out of the accumulated surplus earnings a stock bonus dividend of 12½% to shareholders of record at Aug. 25, two quarterly dividends of 1¼% paid Apr. 1 and July 1, and two quarterly dividends of 2% the first paid Oct. 1, 1911, and the second payable Jan. 2, 1912.

The Toronto and York Radial Ry. reports that the earnings continue to show very satisfactory increases—the gross income amounting to \$449,059.16, compared with \$399,615.69 for 1910, an increase of 12.3%, while the net earnings, after providing for all operation and maintenance charges, bond and loan interest, etc., show a surplus of \$63,266.20, an increase over the previous year of \$7,268.17.

The Toronto Power Co., Ltd., the capital stock of which is owned either directly or indirectly by the Toronto Ry. Co., purchased during the year over 99% of the \$4,000,000 paid up capital stock of the Toronto Electric Light Co., which has for 11 years paid dividends ranging from 7 to 8% on its outstanding capital stock. During the past five years the dividend has been 8%. The company's accumulated surplus is in excess of \$1,500,000.

INCOME ACCOUNT.

Gross earnings	\$4,851,541.42
Operating, maintenance, etc.	\$2,653,361.86

The reconstruction of the tracks in the downtown district on Dundas St. and on Richmond St., equalling 1.52 miles of single track with 80-lb. T rail in 60-ft. lengths, was completed during the year. This included several large pieces of track special-work, all of which were renewed. At several other places throughout the system, new pieces of special-work, such as curves, switches and crosses were renewed and the tracks generally maintained in good condition.

A new single-truck sweeper was added to the rolling stock, making the maintenance of service during snow-storms very much more reliable.

As a result of the census of 1911, the city is entitled to 1.73 miles of additional track. Various routes and localities have been considered for this new trackage, but no definite agreement has yet been made with the city regarding it. Some of it will be used for double tracking congested sections, and the remainder used in the form of extensions into those portions of the city requiring car service the most, and which should result in greater accommodation to the public.

The gross earnings and surplus for the past year having shown very substantial increases, it has not been necessary to dispose of any more bonds. The substantial increase in earnings of 12% for Dec. and for Jan., 1912, is very gratifying to your directors, who confidently expect the coming year to be the most successful in the history of the company.

Statistics: Expenses, per cent. of earnings, 68.9; net income, per cent. of capital, 10.51; passengers carried, 7,582,120; car earnings per revenue passenger, 3.67c.; transfers, 1,178.88; total passengers, 8,761,005; car earnings per passenger, 3.13c.; car mileage, 1,440,611; gross earnings per car mile, 19.10c.; operating expenses per car mile, 13.37c.; net earnings per car mile, 6.03c.; number of miles of track, 33.25; gross earnings per mile of track, \$8.409.23.

There are 33.25 miles of single track, covering about 26 miles of territory, 20.08 in the city and 5.2 outside.

It was finally decided not to use hydro power from Niagara, but to extend the company's steam plant. An addition of 80 x 40 ft. will be built to the power house. Three modern boilers, 300 h.p. each, will be added to the present six return tubular boilers of 150 h.p. each and a 750 or 1,000 k.w. generator will be

added to the present equipment, which consists of one 400 k.w. direct connected generator and six old Edison 80 k.w. generators.

The board as re-elected for the current year is: President, H. A. Everett, Cleveland, Ohio; Vice President, T. H. Smallman, London; other directors, H. S. Holt, Montreal; E. M. Moore, Cleveland; W. M. Spencer and C. H. Ivey, London. The Manager is C. B. King and the Secretary-Treasurer, J. H. Williams.

Electric Railway Finance, Meetings, Etc.

Brantford St. Ry.—The moveable chattels of the Brantford St. Ry., except those used as public utilities, were seized on Feb. 10 for unpaid taxes.

British Columbia Electric Ry.—Gross earnings for Dec., 1911, \$523,003; operating expenses, \$319,298; net operating earnings, \$203,705; renewal funds, \$37,935; net earnings, \$165,770; approximate income from investments, \$25,000; net income, \$190,770, against \$389,234 gross earnings; \$224,549 operating expenses; \$164,655 net operating earnings; \$25,417 renewal funds; \$139,268 net earnings; \$20,000 approximate income from investments; \$139,268 net income, for Dec., 1910. Aggregate gross earnings for six months ended Dec. 31, 1911, \$2,801,394; net earnings, \$979,187, against \$1,991,648 aggregate gross earnings, and \$829,896 net earnings for same period 1910.

An issue of £800,000 4¼% perpetual guaranteed debenture stock of the Vancouver Power Co., was recently placed on the London, Eng., market at 96%. The stock is guaranteed unconditionally both as to principal and interest by the British Columbia Electric Ry. Co., which owns all the issued share capital of the V.P. Co., amounting to \$7,000,000. The B.C.E.R. Co. was incorporated in 1897 and has an issued capital of £3,000,000 divided equally into preference, preferred ordinary and deferred ordinary stock, quoted on the exchange at the end of 1911, at 110, 112 and 139½ respectively. The company's operations are carried on in Victoria, Vancouver, North Vancouver, New Westminster, Steveston and Chilliwack, and it operates 232 miles of fully equipped electric railway, in addition to its lighting and power systems. The company's power is generated by the Vancouver Power Co., the waters of Lakes Buntzen and Coquitlam being utilized for the purpose. The power house is about 16 miles from Vancouver and 11 from New Westminster. The B.C.E.R. Co. has a steam power plant in reserve.

The estimated earnings for the year ending June 30, 1912, are £484,042, and the estimated London charges and capital amortization charge are £25,000. The amount required to pay interest on the bonds and debentures at present outstanding is £101,457, to which may be added the interest on the present issue of stock, leaving an estimated surplus of £323,585 available for renewals, maintenance, dividends, etc. The accumulated reserves total £337,000.

Calgary Municipal Ry.—Following are particulars of operation for January:—Earnings, 1912, \$37,575.90; 1911, \$19,878.82; operating expenses, 1912, \$23,370.98; 1911, \$13,409.86; net profits after crediting 5% of gross receipts to contingent account and providing for interest and sinking fund, 1912, \$7,062.80; 1911, \$2,759.14; revenue per car mile, 27.752c, operating expenses per car mile, 17.261c; gross profit per car mile, 10.491c; cost of power per car mile, 3.265c; proportion operating expenses to revenue, 62.1%.

Cape Breton Electric Co.—Gross earnings for Dec., 1911, \$31,417.93; operating expenses, \$15,187.38; net earnings, \$16,230.55; interest and taxes, \$5,123.33;

balance, \$11,107.22; sinking and improvement funds, \$1,140; net income, \$9,967.22, against \$29,519.63 gross earnings; \$14,194.45 operating expenses; \$15,335.18 net earnings; \$5,051.29 interest charges and taxes; \$10,283.89 balance; \$1,141.68 sinking and improvement funds; \$9,142.21 net income for Dec., 1910. Aggregate gross earnings for year ended Dec. 31, 1911, \$337,554.88; net earnings, \$161,923.73; fixed charges, \$73,962.61; net income, \$87,961.12, against \$326,010.11 aggregate gross earnings; \$155,822.88 net earnings; \$73,834.88 fixed charges; \$81,988 net income for same period 1910. During 1911 the construction charges were \$81,185.95, against \$10,394.30 in 1910. The assets total \$2,907,636.34, and the liabilities, including Sydney and Glace Bay Ry. bonds \$195,000, total \$2,503,978.26, the balance of \$403,658.08 constituting sinking and improvement funds, replacement reserve and surplus.

Edmonton Radial Ry.—The accounts of the city of Edmonton, Alta., for the year ended Oct. 31, 1911, issued Feb. 1, contain the accounts of the Street Railway Department, which manages the E.R. Ry. The gross earnings were \$245,264.64, from which is deducted \$763 on account of outstanding tickets, making the net earnings, \$244,501.64; interest on unexpended balances brings this up to \$250,514.84. The expenditure includes:—Operation, \$165,606.65; maintenance, \$34,540.38; management, \$40,357.92; interest and redemption, \$64,636.04; special charges, \$4,190.92; total, \$285,340.94. This shows a deficit of \$34,826.07. The returns for the year ended Oct. 31, 1910, showed a deficit of \$29,269.74, on receipts of \$147,287.39, and expenditures of \$176,557.43. The capital account shows that there have been issued \$980,446.66 of debentures on account of the lines, of which \$11,642.23 have been redeemed, leaving \$968,804.43 outstanding.

Halifax Electric Tramway.—Railway receipts for Jan., \$17,772.99, against \$16,380.69 for Jan., 1911.

Hamilton St. Ry.—The earnings for 1911 were \$454,010.52, an increase of \$75,000.18 over 1910. The city's percentage for the year was \$36,320.84, an increase of about 20%.

International Ry. Co.—The question of the local fare at Niagara Falls, Ont., between the upper and lower bridges, which has been in dispute for some time, has been settled by the company reducing it from 10c to 5c, and this reduction has been approved by the Queen Victoria Park Commissioners and the Ontario Railway and Municipal Board, the Court of Appeal has decided that these bodies have joint jurisdiction. The company has refused to reduce the fare from the lower bridge to the Dufferin Islands to 5c.

Montreal Tramways Co.—The amalgamation of the Montreal Tramways Co. and the Canadian Light and Power Co. will, it is said, be effected by a holding company taking up the common stock of the two companies to be absorbed. The holding company will be the Montreal Tramways and Power Co., with a London, Eng., charter, and a capital of \$20,000,000. The shareholders of the Montreal Tramways Co. and the Canadian Light and Power Co. will receive 1½ shares of the Montreal Tramways and Power Co. for each share now held by them. The holders of \$2,000,000 of common stock of the Montreal Tramways Co. will receive \$3,000,000 stock of the consolidated company, and the holders of the outstanding \$6,000,000 of Canadian Light and Power Co. will receive \$9,000,000 stock of the consolidated company. The Montreal Tramways and Power Co.'s outstanding stock will, therefore, be \$12,000,000 of the \$20,000,000 authorized.

Ottawa Electric Ry.—Press reports state that the directors have arranged to issue \$600,000 of the unissued stock of the company to the existing shareholders, at par, in the proportion of one share of the new stock to every two shares now held.

Regina Municipal Ry.—The street railway committee of the Regina, Sask., Municipal Ry. had before it, Jan. 30, the Superintendent's estimates for the current financial year. He estimated the necessary expenditures for operation at \$102,700, and the probable receipts at \$155,000.

St. Thomas Street Ry.—The report of operations for the year 1911 was laid before the street railway committee of the St. Thomas, Ont., city council Feb. 2. The passenger receipts were \$9,435.55, and miscellaneous receipts, including \$1,413.86 from the London and Lake Erie Ry. and Transportation Co., \$2,361.83, a total income of \$11,797.38. The total expenditures were \$28,412.57, the deficit on operation being \$10,357.48 against \$12,944.44 in 1910.

Sherbrooke Ry. and Power Co.—The gross receipts for the six months ended Dec. 31, 1911, were \$44,800.81, and operating expenses \$25,945.73. After meeting bond interest and general expenses there was a surplus of \$2,371.31, which is carried to the credit of profit and loss account, which now stands at \$6,065.77. The company's properties are valued at about \$2,000,000. The new power plant and transmission line were put in operation during Feb.

Winnipeg Electric Ry.—Gross earnings for Dec., 1911, \$319,900; operating expenses, \$169,121; net earnings, \$150,779, against \$340,281 gross earnings; \$177,754 operating expenses; \$162,527 net earnings for Dec., 1910. Aggregate gross earnings for 12 months ended Dec., 31, 1911, \$3,829,749; net earnings, \$1,928,782, against \$3,284,341 aggregate gross earnings; \$1,629,508 net earnings for same period 1910.

Winnipeg Electric Railway Sustained by the Privy Council.

The Imperial Privy Council, London, Eng., gave judgment, Feb. 21, in the appeals of the Winnipeg city council and of the Winnipeg Electric Ry. Co. against the Canadian decisions in the action brought by the council to have the company's poles and lines for the supply of light and power removed from the streets on the ground that no franchise existed, and that the company was not manufacturing power within the city as provided. The W.E. Ry. Co. has absorbed a number of other concerns, each of them having franchises in the city. It had been held that the amalgamations had not been technically completed in every case, but the Privy Council decided that the city had acquiesced, by having from time to time given permission for the erection of poles and the stringing of wires in the city. It was also decided that the erection and maintenance of transformer stations and plants for the distribution of power within the city was a substantial fulfilment of the condition requiring the manufacture of power in the city. The decision went so far as to find that there was nothing in the agreements forbidding or restricting the importation of power from outside the city bounds. The appeal of the company was allowed, and that of the city was dismissed with costs.

J. L. Englehart, Chairman, Temiskaming and Northern Ontario Ry. Commission, is reported to have announced at Cobalt, Feb. 23, that a passenger service will be started to Timmins, on the Porcupine branch, March 11.

Sandwich, Windsor and Amherstburg Railway.

The annual report of the Detroit United Ry. Co. for 1911 covers all the subsidiary companies, including the Sandwich, Windsor and Amherstburg Ry., of which the following particulars are given:—Mileage, 36.636; funded debt, \$35,260.66; revenue passengers, 3,543,765; transfer passengers, 487,255; employe passengers, 23,828; receipts per revenue passenger, 0.0542c.; receipts per passenger, 0.0473c.; car mileage, 911,109; earnings per car mile, 0.2188c.; expenses per car mile, 0.1096c.; net earnings per car mile, 0.1092c.; expenditure on extension of lighting plant, new track and purchase of six cars, \$45,056.64. In the D.U.R. balance sheet, under investments, the S.W. & A. Ry. is given as \$253,134.91, and under accounts current as \$257,732.11.

BALANCE SHEET, SANDWICH, WINDSOR AND AMHERSTBURG RY.		
Capital stock	\$	297,000.00
Mortgage bonds		490,000.00
Accrued interest on bonds		4,987.50
Detroit United Ry.		257,732.11
Accounts payable		1,253.94

	\$ 306,009.18	\$ 306,009.18

The earnings and expenses of the Windsor and Tecumseh Electric Ry. are included in the operations of the S. W. and A. Ry., which latter owns all of the capital stock of the W. and T.E.R.

Dominion Power and Transmission Co's Annual Report

This company, which includes among its properties five electric lines, the Hamilton St. Ry., Hamilton Radial Ry., Hamilton and Dundas Ry., Hamilton, Grimsby and Beamsville Electric Ry., and Hamilton and Brantford Ry., held its annual meeting in Hamilton, Ont., Feb. 19. The statements presented show the combined results of operations of the various subsidiary companies, power, light and railway, and do not give any separate information as to the operations of the railway lines. This information, up to June 30, 1911, will, however, be found in the general electric railway statistics on another page of this issue.

The directors' report said:—"Much was done in the betterment of the Hamilton St. Ry. tracks, and its rolling stock was largely improved and added to. The power plant for the street railway was increased by 50%. These improvements, while costly, are well made and well warranted. Three cars were added to the interurban equipment and three more have been ordered."

The President, in moving the adoption of the report, said:—"During the past three years over 60% of the Hamilton St. Ry. tracks have been reconstructed in a very thorough and substantial way, while the rolling stock has been added to and greatly improved, and probably during the present year a new car per month will have to be added, while some additions will also be made to the rolling stock of the suburban lines. The

addition of two new units in the powerhouse at Power Glen—7,500 h.p. each—enables the company to take on further considerable blocks of power and to feel amply prepared for any increasing demands on railway business."

Reference was made to the payment of dividend 19, one of the arrears of preference cumulative dividends. One or two shareholders objected to certain dividends having been diverted to pay for street railway improvements, but the directors' action was overwhelmingly endorsed.

The following directors were re-elected:—J. R. Moodie, President; J. Dixon, J. Knox, W. C. Hawkins, Sir John M. Gibson, J. Sutherland, Lloyd Harris and W. Southam. The vacancy caused by S. O. Greening's death will be filled later.

Operating Rules for Interurban and Suburban Electric Railways.

A special committee of the Canadian Street Railway Association, which has for some time past, at the Board of Railway Commissioners' request, had under consideration the question of uniform operating rules for interurban and suburban railways, met in Ottawa Feb. 16, those present being J. Anderson, Manager, Sandwich, Windsor and Amherstburg Ry.; P. Dubee, Secretary, Montreal Tramways Co.; E. P. Coleman, Manager of Railways, Dominion Power and Transmission Co.; G. Gordon Gale, General Superintendent, Hull Electric Co.; J. E. Hutcheson, Superintendent, Ottawa Electric Ry.; A. Eastman, General Manager, Windsor, Essex and Lake Shore Rapid Ry.; W. R. Robertson, Superintendent, Niagara, St. Catharines and Toronto Ry.; and Acton Burrows, Managing Director, Railway and Marine World, Secretary-Treasurer of the Association.

A long conference was held with A. J. Nixon, Chief Operating Officer, Board of Railway Commissioners, who was accompanied by J. Murphy, Electrical Expert, and J. Ogilvie, Inspector of Equipment, on the Board's staff.

In view of the great differences in local conditions it was found to be most difficult to frame rules which would be generally adaptable, and it was finally decided that each company under the Board's jurisdiction should submit its rules for separate approval.

The members of the committee were entertained at luncheon at the Ottawa Golf Club by G. Gordon Gale, General Superintendent, Hull Electric Co., traveling to and fro in the company's private car.

Electric Railway Employees' Hours of Labor in Ontario.

Sir James Whitney has introduced a bill in the Ontario Legislature to amend the Ontario Railway and Municipal Board Act by adding the following clauses:—

"The board may regulate the hours during which conductors, motormen, or other employees of a street railway company may be required or permitted to work

"The power conferred by subsection 1 may be exercised, notwithstanding the provisions, of any agreement between a municipal corporation and a railway company as to hours of labor.

"Every company and every director, superintendent, manager or officer of a company who contravenes the provisions of any order of the board made under the authority of subsec. 1 shall for each contravention incur a penalty of not less than \$10 and not more than \$50 recoverable under the Ontario Summary Convictions Act."

Street Railway Track Construction in Toronto.

In his presidential address at the Canadian Society of Civil Engineers' annual meeting in Montreal recently, C. H. Rust, City Engineer of Toronto, said: "The construction of street railway tracks in city streets is a work involving many difficulties. Experience in Toronto has shown that T-rails, weighing from 70 to 80 lbs., and grooved girder rails, weighing from 90 to 100 lbs., are the most satisfactory. T-rails are used on residential streets and in the outskirts, but the heavy grooved girder type of rail is used upon streets subjected to heavy traffic. The rails are laid upon steel ties, 6 ft. centres, with suspended joints. Under the whole of the track allowance pavement for about a width of 18 ft., a concrete foundation 12 ins. in depth is used. This is increased to 18 ins. at intersections. The city of Toronto has been experimenting this year with wooden ties, having 2 ft. centres, to ascertain if the vibration and noise caused by the use of the rigid type of construction necessarily involved by the steel ties could not be got rid of."

Ottawa Electric Railway Advances Wages.

J. E. Hutcheson, Superintendent, Ottawa Electric Ry. Co., announced recently a voluntary increase of wages of conductors and motormen, dating from Jan. 1. First year men now receive 20c, second year men 21c, and those in the service over two years 23c an hour for week days, with 2c an hour advance on above rates for Sunday work. In addition to this all men get free transportation and those in the service over one year receive two suits of uniform clothing each year free. First year men pay half cost of such uniforms. The company provides special cars to bring the men to work in the early morning, and also to take them home at midnight. Following are extracts from the bulletin announcing the advance:—

Regular men will only be booked to work alternate Sundays without their consent. They will, however, be expected to work when booked, unless given leave of absence. Spare men will be expected to work every Sunday if required. If leave of absence is desired, application must be made to the inspector on duty.

The rates for work on snow sweepers and plows are:—From 6 a.m. to 12 midnight, 23½c an hour; from 12 midnight to 6 a.m., 25c an hour.

The hours of work for regular men remain as before, 10 hours constituting a day's work, or as near 10 hours as the schedule of runs will permit. Men will not be required to work beyond the full day of 10 hours unless they wish to do so, except in cases of absolute necessity.

Snow on the Hull Electric Co.'s Ry.—G. Gordon Gale, General Superintendent, Hull Electric Co., Deschenes, Que., writes in reference to snow clearing:—"We have 8.6 miles city track and 16.2 miles of private right of way in use during the winter months. In the city we keep the full width of the street clear of snow. The tracks are cleared by means of single-truck sweepers of the standard design, and the roadway is cleared by a double-truck, double-end, double-side-wing plough, built by the Ottawa Car Company. The private right of way is cleared of snow by a double-end, right-hand, double-truck snow plough. Our snow expenses amount to about \$50 per inch of snow fall, or an average of approximately \$2 per inch of snow fall per mile."

Electric Railway Projects, Construction, Betterments, Etc.

Alberta Electric Ry.—We are officially advised that progress with the organization of this company, the title of which it is proposed to alter to the Alberta Interurban Ry., has been somewhat delayed owing to legal technicalities. It is stated that these matters have now been arranged, and that the organization work is being proceeded with. (Jan., pg. 38.)

Aroostook Valley Rd.—U.S. press dispatches state that the Maine Railroad Commissioners have approved the company's plans for the extension of its line to Sweden, Me. This relates to the line already built between Washburn and Sweden, Me. This is the line which is to be connected with the St. John Valley Ry. in New Brunswick, to form part of the through line between St. John, N.B., and Quebec, to be known as the St. John and Quebec Ry. (See St. John and Quebec Ry., Feb., pg. 62.)

Bassano Electric Power and Traction Co.—The proposed electric railway from Bassano, Alta., to the C.P.R. irrigation dam, a distance of about five miles, is to be built by a company being organized under a provincial act, with the title of the Bassano Electric Power, Light and Traction Co. The provisional organization has the title of the Bassano Power and Electric Co., to which the municipality has, under a by-law, granted a franchise for the building of the railway, as well as for the supply of light within the municipality. We have been advised that it was expected to be able to supply light in the town early in March. S. E. Whiting, mayor of Bassano, is President of the company, and among those associated with the company are F. D. Murchison, Bassano, and W. H. McLaws, of Loughheed, Bennett and Co., solicitors, Calgary.

We have been further advised that the franchise for building an electric railway from Bassano to the C.P.R. irrigation dam was originally granted to a company in which S. E. Whiting, W. J. Robinson, I. W. Shoop, Pegler and Darby, Murchison and Haines and other Bassano men are interested. The Canadian Development Co. of Calgary is also interested. The company proposes to supply power and electric light, as well as to operate the railway. A contract has been let to Gorman, Clancy and Grindley, Ltd., Calgary, which has, as a subsidiary company, the Western Canada Engineering, Construction and Paving Co. S. A. Clancy, the Secretary of both companies, informs us that his firm will build the electric railway for the Bassano Electric Traction Co., and that construction will be started as soon as the frost is out of the ground. The line from Bassano to the C.P.R. irrigation dam will be about 12 miles. It has not been definitely decided whether the line will be operated by electricity or by gasoline cars, but it is probable that electricity will be used. The 50 ft. double end type of car, provided with smoking and baggage compartments, will be used. (Jan., pg. 38.)

Berlin and Bridgeport Electric Ry.—The Berlin, Ont., town council passed a resolution, Feb. 19, endorsing the company's proposal to extend the line through Bloomingdale, West Montrose and Winterbourne to Elora. The Ontario Legislature is being asked for power to build this line.

Brandon Electric Ry.—Application is being made to the Manitoba Legislature for an act amending chap. 76 of the statutes of 1911, by authorizing amalgamation with other companies. Mulock, Loftus, Armstrong and Lindsay, Winnipeg, are solicitors for applicants. (See also Brandon, Man., and Wheat City Electric Ry.)

Brandon, Man.—The city council has

had under consideration propositions for the building of an electric railway in the city. The latest proposition comes from B. C. Donham, of New York. Other offers came from J. D. McGregor and Col. O'Grady. Mr. McGregor did not renew his proposition, consequently only the other two offers came before the council Jan. 30. The city solicitor suggested the insertion of certain additions to the agreement, and a public meeting was held Feb. 8 to discuss the matter. No decision has been reached. (Feb., pg. 91.)

British Columbia Electric Ry.—The question of the company's franchises in what is known as greater Vancouver continues to be discussed in the various municipalities interested. The franchise bylaw in Point Grey was defeated, and it is stated that the franchises in Hastings and D. L. 301 are void. The Vancouver city council, Feb. 4, appointed a special committee to obtain the views of the company with the object of consolidating the franchises throughout the whole district.

It is reported that the work of building a second track on the Vancouver-New Westminster interurban line will be completed this year. The double track at present ends at Highland Park.

The Saanich extension out of Victoria will terminate at Deep Cove, but press reports state that a branch is to be built to Union Bay. It is also reported that wharves and ferry terminals will be built at Deep Cove, and that a ferry service to the mainland will be established. The construction gangs have reached mileage 18, and it is expected that the line will be completed by the autumn.

The Vancouver, Fraser Valley and Southern Ry. is applying to the Dominion Parliament for an act extending the time within which the following lines of railway may be built; from New Westminster to the International boundary near Douglas; from the southern end of the Fraser River Bridge near New Westminster easterly to Chilliwack; from the south bank of the Fraser River westerly to Ladners Landing. It is also desired to have power to enter into agreements with the British Columbia Electric Ry. and its subsidiary, the Vancouver Power Co. (Feb., pg. 91.)

Buffalo and Fort Erie Ferry and Ry. Co.—We are officially advised that the company has not in contemplation the building of a line from Crystal Beach to Port Colborne, Ont., and a second track on the line between Crystal Beach and Fort Erie, as stated in press reports. (Feb., pg. 91.)

Calgary Municipal Ry.—Surveys are being made and plans prepared for an extension to the site of the C.P.R. new shops at Maharg, Alta. It is expected that construction will be started early in the spring. (Feb., pg. 91.)

Cape Breton Electric Co.—Surveys are being made, according to press reports, for lines from Sydney and Dominion to New Waterford, N.S. The first line mentioned would be 14 miles long, and the second about six miles. (Jan., pg. 38.)

The Chestermere-Calgary Suburban Ry. has begun the construction of an electric railway about 18 miles long to connect Calgary, Chestermere Lake, Hubalta, Belyedere, Victoria Square, Gladstone Heights, and six other subdivisions of Calgary, Alta. Everything has been purchased excepting the cars and substation equipment. The company will operate 10 cars and will furnish power for lighting purposes. Its repair shops will be located at Chestermere Lake, and it will purchase power from the Calgary Power Co. Following are the officers:—President, General Manager and Purchasing Agent, J. A. McCullough; Vice President, G. A.

Shipp; Treasurer, A. D. McGillis; Secretary, W. H. Horner; Chief Engineer, J. H. Turner. The offices are in Calgary, and the capital is \$250,000 authorized and issued. (Dec., 1911, pg. 1171.)

Coteau Power Co.—Engineers are reported to be locating the route for an electric railway between Vernon and Kelowna, B.C., about 12 miles. The company, which is controlled by Mackenzie, Mann and Co., Ltd., is developing water powers near Vernon, and it is reported that work on the electric railway will be started this season. (Oct., 1911, pg. 973.)

Crows Nest Pass Electric Ry.—The Alberta Legislature is being asked to incorporate a company with this title to build an electric railway from Crows Nest Lake easterly to Cowley, Alta., about 25 miles. The provisional directors named are: W. A. Bebe, R. Coulthard, T. B. George, Blairmore, Alta. The line proposed to be built would serve Coleman, Blairmore, Frank, Bellevue, Passburg, Burmis, Lundbreck and Cowley.

Edmonton Radial Ry.—A bylaw authorizing the expenditure of \$602,006.34 on extensions of the municipally owned electric railway system in Edmonton, Alta., has been approved by the taxpayers by 335 to 88. (Jan., pg. 38.)

Grand Valley Ry.—It was reported, Feb. 12, that the G.V. Ry. between Brantford and Galt, Ont., had not been operated for about a month, and the Paris town council passed a resolution calling on the company to reopen the line, and authorizing an application to the Board of Railway Commissioners in the event of it not being reopened at once. (July, 1911, pg. 683.)

Guelph Radial Ry.—The Guelph, Ont., city council has voted \$13,500 for the extension of the electric railway in the city. (Jan., pg. 38.)

Halifax Electric Tramway Co.—Press reports state that the company is preparing to build about three miles of new track in the city. (Nov., 1911, pg. 879.)

Hamilton, Grimsby and Beamsville Electric Ry.—At a meeting held in St. Catharines, Ont., Jan. 31, one of the company's officials is reported to have stated that the projected extension of the line into that city would undoubtedly be made if satisfactory conditions could be secured. It is said that the difficulty lies in the cost of the right of way. The original surveys ran through a lot of fruit land, the cost of which is high, and an alternative route along the brow of the mountain is being considered.

Press reports have referred to a probable extension of the line from Beamsville to St. Catharines. It is more likely that a direct line would be built from Hamilton to St. Catharines on private right of way, the present line between Hamilton and Beamsville being on the highways.

Hamilton, Waterloo and Guelph Ry.—In an interview recently, the promoter, J. Patterson, of Hamilton, is reported as stating that arrangements were being completed for the building of this line; that there was no truth in the press reports that it would be built in the interests of the Canadian Northern Ry.; that the English interests behind the project were represented by Sir Robt. Perks; that the line would be built by McArthur Bros., of New York, and that construction would be started early in the spring.

We were officially advised Feb. 6 that nothing had been closed with McArthur Bros. or the International Bond and Share Corporation, but that the project was being examined and it was quite likely that some arrangement would be concluded in six or eight weeks. (Jan., pg. 33.)

International Railway (British Columbia).—A proposition is being made by representatives of this company for the building of an electric railway into the Delta district. The municipal council, Feb. 6, promised to give consideration to a definite proposal and the company's representatives undertook to submit one in about a month. H. T. Thrift, —, Leeson and —, McDuff stated that the company was backed by British capital; that it had about £1,000,000 on deposit ready to proceed with the development of its power plant and railway plans as soon as the various negotiations were successful; that it had secured ample water rights within 150 miles of Ladner, and that its engineers were at work on plans for developing them.

Lake Erie and Northern Ry.—The Minister of Railways has approved the route plan of this projected railway between Brantford and Port Dover, Ont., and the Board of Railway Commissioners has approved location plans for the line from the Grad River, Brantford to Port Dover. The route passes through Waterford and Simcoe, and the Board has also granted the right to cross at grade, subject to conditions, the Grand Valley Ry., the Toronto, Hamilton and Buffalo Ry. and the Michigan Central Rd. The question of crossing the G.T.R. in Simcoe, where a subway is asked, was referred to the Board's engineer. The Brantford city council has granted rights in the city to a terminus near the old G.T.R. station. (Oct., 1911, pg. 975.)

London and North Western Ry. of Canada.—Press reports state that plans are being prepared for the building of a dam and power plant at Rock Glen, near Arkona, Ont., the work being in charge of Smith, Kerry and Chace, Toronto. The estimated cost is \$3,000,000. (Dec., 1911, pg. 1171.)

London Street Ry.—The extension of the electric lines in the city was considered by the London, Ont., city council Feb. 9. C. B. King, the company's Manager, said the question presented difficulties, as the wants of the city for the next ten years had to be considered. The building of a second track on certain of the existing lines was necessary to take care of existing traffic and to prevent congestion of traffic when the extensions were made. The company was ready to meet the city and discuss the question at length. (Feb., pg. 91.)

Maharg Electric Ry.—Application is being made to the Alberta Legislature to incorporate a company to build an electric railway in and radiating from Maharg, Alta., which is 4½ miles east of Calgary, and is the site of the new C.P.R. shops. Loughheed, Bennett, McLaws and Co., Calgary, Alta., are solicitors for applicants.

Medicine Hat Electric Ry.—Application is being made to the Alberta Legislature for the incorporation of a company with this title, to build an electric railway within the city of Medicine Hat, easterly to Dunmore, returning by a different route, and from Medicine Hat southeasterly to Elk Water Lake. W. A. Begg, Medicine Hat, is solicitor for applicants.

A public meeting was held in Medicine Hat, Jan. 31, when the proposed charter was discussed. The meeting favored the idea of municipal ownership, and a resolution favoring the franchise granted by the city council was passed, provided that it did not conflict with the rights of the municipality owning all public utilities. The proposed incorporation act contains a section, approved by the city council, providing that the city may on six months notice acquire the company's works within the city boundaries as they are at present or as they may be extended at any time hereafter.

Montreal.—The Montreal city council is asking the Quebec Legislature to au-

thorize the building by the city of a boulevard, with a street railway on the banks, and in the vicinity of the aqueduct, and for the building of an underground railway in the city. (Jan., pg. 38.)

Montreal and Southern Counties Ry.—We are officially advised that the proposed extensions of this line are the electrification of the Central Vermont Ry. branch lines from St. Lambert to Richelieu, Que., 14 miles, work on which is now under way, and the following:—Richelieu to Marieville, five miles; Marieville to St. Cesaire, nine miles; a new line, St. Cesaire to Granby, 14 miles; and the line from Granby to Waterloo, 15 miles; a new line along the east side of the Richelieu River, from Richelieu to Sorel, 45 miles; a line from Longueuil to Boucherville, six miles; a line from St. Lambert to Laprairie, seven miles, and a line of about 120 miles from Laprairie through the counties of Huntingdon, Chateauguay and Beauharnois. The surveys for the necessary work on these lines are being made, but no definite decision has been reached as to when work on them will be started. The Quebec Government has been asked to grant a subsidy in aid of the building of the line from Richelieu to Sorel, 45 miles, but the Premier, while promising consideration, said a difficulty in the way was the fact that the company was operating under a Dominion charter.

The Montreal city council had under consideration, Feb. 15, the company's application for the extension of its lines to the main retail business streets of the city. W. B. Powell, General Manager, stated the case for the company, which is being given consideration.

A contract was reported let, Feb. 15, for the building of a new car barn and power substation in St. Lambert.

A contract is about to be placed for building a substation and four track barn in St. Lambert. (Jan., pg. 38.)

Montreal Tramways Co.—We are officially advised that the company has extended its Guy St. line with a single track from Cote des Neiges Road and Westmount Boulevard to the Roman Catholic cemetery, .75 of a mile.

The Montreal West corporation is asking the Quebec Legislature for power to grant the Montreal Terminal Ry., one of the M.T. Co.'s constituent companies, a franchise for 50 years.

Negotiations are still renorted to be in progress between the M.T. Co. and the C.P.R. for the building of an extension along the C.P.R. right of way on the south side of the canal from Cote St. Paul to Lachine. (Feb., pg. 91.)

Moose Jaw Electric Ry.—Press reports state that arrangements have been made for the building of five miles of additional track during the current year. Our latest official advice stated that the laying of one mile of new track had been decided on, and that other extensions were under consideration. (Dec., pg. 1171.)

Mount McKay and Kakabeka Falls Ry.—The Ontario Legislature is being asked to authorize an increase of the capital stock to \$500,000, and to extend the time for the completion of the company's authorized line of railway to April 30, 1916. J. E. Swinburne, Fort William, Ont., is the solicitor. (July, 1911, pg. 683.)

Nanaimo, B.C.—Application is being made to the British Columbia Legislature to confer upon the Nanaimo city council the right to build and operate a street railway within or without the city, subject to the approval of the ratepayers, and to authorize the council to obtain the necessary charter therefor under the provisions of the general Railway Act of the province. (Dec., 1911, pg. 1171.)

Niagara Fruit Growers' Tramway.—The Ontario Legislature is being asked to incorporate a company with this title to build an electric railway from Niagara-on-the-Lake to St. Catharines, Port Dalhousie and Queenston, all in Lincoln county, and to make connections with and obtain running rights over the lines of other companies. J. S. Campbell, St. Catharines, Ont., is solicitor for applicants.

Niagara, Welland and Lake Erie Ry.—A trust mortgage deed dated Sept. 1, 1911, between the company and the National Trust Co., Toronto, securing an issue of bonds, has been deposited with the Secretary of State at Ottawa.

We are officially advised that the company has a section of its line built through the principal streets of Welland, Ont., from the G.T.R. station to the Michigan Central Rd. and Toronto, Hamilton and Buffalo Ry. stations, 1.5 miles. The line is not yet being operated, but it is the intention to give a 15 minute service, using three cars. These are already on hand, and it is expected to start the service as soon as spring opens. Extensions are contemplated to be built in the early spring, the surveys for which are being made by H. Leach, the company's engineer. Contracts are being arranged for track and overhead material for these extensions. (Jan., pg. 39.)

Nipissing Central Ry.—It is understood, from an interview with J. L. Englehart, Chairman of the Temiskaming and Northern Ontario Ry. Commission, that tenders will be asked at an early date for building an extension of the N.C.R. from Halleybury to New Liskeard, about five miles. (Dec., 1911, pg. 1171.)

North Midland Ry.—The Ontario Legislature is being asked to confirm a bylaw voting a subsidy of \$25,000 to the company, notwithstanding the fact that although approved by the large majority of taxpayers voting, it did not receive the requisite proportion of votes. (Feb., pg. 91.)

North Midland Ry.—The Ontario Legislature is being asked to extend the time within which the company may build its authorized lines of railway. T. H. Luscombe, London, Ont., is the solicitor. (Feb., pg. 91.)

Ontario West Shore Ry.—The municipalities which have been called upon to pay interest on the company's bonds which they had guaranteed, do not propose to take any action against the company at present. It was intimated to them recently that the company was making arrangements for the completion of the line, and for the payment of interest without calling upon the municipalities. (Feb., pg. 91.)

Ottawa and Lake McGregor Ry.—The Dominion Parliament is being asked to incorporate a company with this title to build a steam or electric railway from Ottawa to Hull, Gatineau Point, Perkins Mills and Lake McGregor, Que. Power is also asked to lay out pleasure parks and to develop summer resorts. J. A. Ritchie, Ottawa, is solicitor for applicants. (See Ottawa Electric Ry., Jan., pg. 39.)

Ottawa Electric Ry.—The company proposes to make additions to its power plant, build new car barns, and make certain additions to its lines, for which purpose \$600,000 of the unissued stock is to be disposed of to the shareholders. It was said that one of the lines to be extended will be the Division St. line. The whole programme of extensions of the lines is being discussed with the street railway committee of the city council. The building of about 6.5 miles of new lines and extensions is being asked by the council.

Ottawa, Smith's Falls and Kingston Ry.—Application is being made to the Ontario Legislature to extend the time within which the company's lines may be built; to authorize the building of a line to Gloucester tp., Carleton county, and to change the name of the company to the Ottawa, Rideau Lakes and Kingston Ry. F. B. Proctor, Ottawa, is solicitor for the company. (Jan., pg. 39.)

Port Arthur and Fort William Electric Ry.—Application is being made to the Ontario Legislature by the Port Arthur city council for confirmation of a number of bylaws, including one to authorize the expenditure of \$17,500 upon an extension of the street railway in the city easterly. Power is also sought to extend the railway outside the city limits. (Aug., 1911, pg. 783.)

Quebec Ry. Light and Power Co.—We are officially advised that it is the company's intention to extend its lines to the National Transcontinental Ry. shops near the north approach to the Quebec Bridge, as soon as the building of the shops is under way. The line will start from the present Sillery branch and will be about 3.5 miles long. (Feb., pg. 91.)

St. John's, Nfld., Electric Ry.—W. D. Reid, President, Reid Newfoundland Co., is reported to have stated in an interview recently that a car service would be given to the Waterford Bridge district during the summer, but he was unable to say whether it would be an extension of the present street car lines, or by the operation of electric cars on the steam railway. (Nov., 1911, pg. 1069.)

St. Thomas Street Ry.—The city engineer is preparing estimates for improving the line and for the building of extensions on Ross and Elgin Streets, St. Thomas, Ont. (Feb., pg. 91.)

Simcoe Ry. and Power Co.—The Ontario Legislature is being asked to extend for five years the time within which the company may build the electric railway authorized to be built. W. Finlayson, Midland, Ont., is solicitor for the company. (June, 1911, pg. 557.)

Stratford Electric Ry.—J. A. Rothery, Manager of the Toronto and Eastern Ry., and connected with other of Mackenzie, Mann and Co.'s enterprises, is reported as having stated in Stratford, Ont., Feb. 7, that a start would be made with the building of the line by May 1. He had been in the city for several days, and it is said that the charter has been acquired by the Mackenzie, Mann and Co. interests, or that negotiations with that end in view are in progress. (Nov., 1911, pg. 1071.)

Sudbury-Copper Cliff Suburban Electric Ry.—Application is being made to the Ontario Legislature to incorporate a company with this title to build a line, with branches, from Sudbury westerly to Copper Cliff, and from Sudbury easterly to Coniston, Ont. Clary and Buchanan, Sudbury, Ont., are solicitors for applicants. (See Sudbury-Copper Cliff, Jan., pg. 29.)

Toronto City.—Application is being made to the Ontario Legislature by the city of Toronto for an act confirming, among other bylaws, one notifying the Toronto and York Radial Ry. of the city's intention to take over the line built under the franchise granted to the Toronto and Scarboro Electric Ry., Light and Power Co., by the agreement of Nov. 16, 1892. A declaration is asked that the city may take over such railway under the provisions of the Street Railway Act, chap. 171, of the Revised Statutes of Ontario, notwithstanding the repeal of the act; authority is asked to take over the line on Nov. 16, even if the arbitration to fix the value has not been completed, on payment into court of a sum to be fixed by a High Court judge; and to issue such debentures as

may be necessary to provide the money required for taking over the line. Power is also asked to connect the line with the Toronto Ry., and to authorize the entering into agreements for the interchange of traffic and for running rights with the Toronto Ry.

The confirmation of a bylaw providing for the issue of debentures for \$139,488 for the building and equipping of a double track line of street railway on Danforth Ave., from Broadview Ave. to 200 ft. east of Greenwood Ave., is also asked. (Feb., pg. 91.)

Toronto Civic Car Lines.—The Lieut.-Governor has issued a proclamation bringing into effect the act authorizing the city to build lines within its boundaries, within which the Toronto Ry. operates under its charter. The act was passed by the Ontario Legislature in 1910, and gives the city power to build lines within the area in question if the T. Ry. Co. fails to build such lines as the city demands, within a certain time. In preparation for the coming into force of the act the council has finally passed the bylaw, carried by the taxpayers Jan. 1, for building a line on Danforth Ave.

Tenders were received to Feb. 20 by the Toronto board of control for the supply of track intersections and other special work layouts. (Feb., pg. 91.)

Toronto and York Radial Ry.—The Etobicoke tp. council has under consideration a proposition to extend the franchise of the Lake Shore division through the township for a further period of 21 years. The company's engineers are making surveys at Mimico Creek with the view of providing a private right of way. The proposed route would take the line 300 yards nearer the centre of the village and cut out a curve at New Toronto.

The question of the double tracking of the Metropolitan Division in North Toronto is still under discussion. The company has declined to accept the proposition made by the council, and on Feb. 4 the council appointed a committee to confer with the company with a view to arriving at some basis of agreement. (Jan., pg. 40.)

Toronto Suburban Ry.—W. H. Grant, Manager of Construction, Mackenzie, Mann and Co., Toronto, is reported as having stated in Guelph, Feb. 1, that the electric railway projected from Toronto to Guelph would be built as speedily as possible, it being expected to start work in the spring, and that the plans for the entrance into Guelph were being prepared, but were not ready for submission to the city council.

In addition to the plans for the extension of the line from Weston to Woodbridge, Ont., which it is expected will be built this year, the plans for the extension of the line now ending at Lambton, to Georgetown, 25.5 miles have been approved. The route of this line is on a private right of way, through Lambton Mills village, south of Dundas St., crossing under the C.P.R. near Islington and alongside Dundas St., on the north side to Summerville, thence to the south side, and parallel with the C.P.R. from Dixie station to Cooksville station. The route then turns north, passing north of Cooksville and near Streetsville, and on through Meadowvale, Churchill, and near Huttonville and Norval to Georgetown. It is said construction will be started early in March. (Feb., pg. 91.)

Western Canada Power Co.—Plans for the building of an electric railway on the north shore of the Fraser River from Mission Jct. to Vancouver, B.C., about 40 miles, are under consideration. W. Neill, Assistant Manager, W.C.P. Co., has been advocating the construction of the line before the Vancouver board of trade and several of the municipal councils in the townships through which the line

will pass. The proposed line would follow the Dewdney trunk road from Mission to Coquitlam, and would proceed thence to Vancouver by a direct route. The Provincial Government will be asked to grant aid towards the building of a railway and general traffic bridge over the Pitt River near Coquitlam. It is reported that a considerable portion of the land required for the right of way has been purchased.

Wheat City Electric Ry.—Application is being made to the Manitoba Legislature to incorporate a company with this title to build an electric railway in the city of Brandon and vicinity. Hull, Sparling and Sparling, Brandon, Man., are solicitors for applicants.

Winnipeg Electric Ry.—Plans for the extension of the company's Winnipeg-Selkirk line by the construction of a line to Stony Mountain and Stonewall, starting from near Middle Church, have been prepared. The plans for the line, so far as the Rockwood municipality is concerned, were approved at the council meeting held Feb. 8. The company is given a free right of way along the roads in the municipality, and the company agrees to have the line completed in two years. (Feb., pg. 91.)

SUPPLY OF RAILS, TIES AND FASTENINGS.

Separate tenders on prescribed forms will be received by registered post only, addressed to the Chairman of the Board of Control, City Hall, Toronto, Canada, up to noon on Tuesday, March 19th, 1912, for the supply of the following:—

1. 250 tons 45-lb. "T" rail, A.S.C.E. section.
2. 100 kegs 5 in. x 9-16 in. spikes.
3. 1,400 pair angle bars for 45-lb. "T" rail.
4. 25 kegs 3/4 in. x 3 in. bolts.
5. 810 tons 80-lb. "T" rail, similar to Lorain Section 335.
6. 972 tons 90-lb. girder rail, similar to Lorain Section 391.
7. 1,100 pair splice bars for Lorain Section 335.
8. 1,250 pair splice bars for Lorain Section 392.
9. 60 kegs 1 in. x 3 3/4 in. track bolts and nuts (200 lbs. per keg.)
10. 5,300 pair of 7 in. x 5 ft. 3 3/4 in. steel tie rods.
11. 6,000 steel ties and necessary rail fastenings.
12. 4,000 wood ties, 5 in. x 6 in. x (6 ft., 7 ft., 8 ft. long).

Specifications and form of tender may be obtained on application to the Department of Railways and Bridges, City Engineer's Office, Toronto.

Envelopes containing tenders must be plainly marked as to contents.

Prospective tenderers will please only ask for the specifications covering those items on which they propose to tender.

Quick delivery will be required on Items No. 1, 2, 3, 4 and 12.

The tenderers shall submit with their tenders, the names of two sureties (approved of by the City Treasurer, not Members of the City Council or Officers of the Corporation of the City of Toronto), or in lieu of said sureties, the bond of a guarantee company approved of as aforesaid.

The lowest or any tender not necessarily accepted.

G. R. GEARY (Mayor).

Chairman of the Board of Control, City Hall, Toronto, February 26th, 1912.

Regina Municipal Railway.

Following are details of the operation for the five months ended Dec. 31, 1911, the railway having been in operation 135 days.

EARNINGS.

Cash fares	\$14,467.88
Ticket sales	8,328.70
	\$22,996.58
Advertising on cars, etc.	641.00
	\$23,637.58

OPERATING EXPENSES.

Maintenance of way and structure.....	\$2,023.31
Maintenance of rolling stock.....	1,160.92
Maintenance of electric equipment.....	656.16
Conducting transportation	9,254.16
Power	2,898.30
General expense	1,654.11

	\$17,646.96

Car Mileage, 86,885 Miles.	

Gross earnings per car mile	27.205 cts.
Gross operating expenses per car mile..	20.311 cts.
Net earnings per car mile	6.894 cts.
Cost of power per car mile	3.334 cts.
Passengers carried	480,695
Gross earnings per day	\$175.09
Net earnings per day	44.37
Gross operating expenses per day	130.72

Electric Railway Notes.

The Ottawa Electric Ry. has received one double truck locomotive type snow sweeper from the Ottawa Car Co. A

Winnipeg Electric Ry. Double Truck Car.

full description with illustration of this sweeper was given in our January issue.

The Winnipeg Electric Ry. has ordered motors and trucks for 30 double truck cars which will be built at its shops this year. They will be 45 ft. 4 ins. long over all, and 8 ft. 5 ins. wide over all, and will be similar to the car which is illustrated in this issue.

The Winnipeg city council, Jan. 30, ratified an agreement with the Winnipeg Electric Ry., providing for the adoption of a single fare for a service to 2 a.m., instead of an all night service, which had been advocated. The agreement is terminable on a three months notice.

The Edmonton Radial Ry. has ordered 15 double end, double truck, pay-as-you-enter cars, the bodies of which will be built in the U.S., the electric equipment supplied by the Canadian General Electric Co., and the air brake equipment by the Canadian Westinghouse Co.

A special committee which has been investigating matters in connection with the Regina, Sask., Municipal Ry., recommended the city council, Feb. 14, to dismiss Superintendent Doughty. Citizens, Feb. 16, got up a petition to the council asking that the recommendation of the committee be rejected.

The Regina Municipal Ry.'s six cars, which are being built by the Preston Car and Coach Co., Preston, Ont., and mention of which has been made in pre-

vious issues, will be equipped with Westinghouse 101B2 electric motors, etc. The bodies will be 22 ft. long, and the length over all will be 31½ ft.

The Winnipeg Electric Ry. has ordered motors, trucks and equipment for 30 double truck cars, similar to the one illustrated in this issue, and which will be built at the company's shops this year. They will be 45 ft. 4 ins. long and 8 ft. 3½ ins. wide over all. Truck centres will be 21 ft. 11½ ins., with deep vestibules front and rear. The rear one is to be 7 ft. 4 ins. deep, with double entrance doors leading from the steps.

J. N. Shannahan has resigned as railway manager of the operating department of J. G. White and Co., Inc., of New York City, to become Vice President and general manager of the Newport News and Old Point Ry. and Electric Co., of Newport News, Va., now controlled by Allen and Peck, Inc.

The Ottawa city council has forwarded to the Ottawa Electric Ry. a petition asking for an extension of the workingman's ticket until 8 a.m. instead of to 7.30 a.m. as at present. In an interview, Feb. 10, the President said he thought the limit had about been reached in making further departures from contract requirements. In addition to concessions, not in the contract, as to tickets, the company was giving a service considerably beyond contract requirements. A recent report of the Superintendent showed that on the Bank St. line, except between 6 and 6.30 p.m.,

W. Cuthbertson has been appointed General Agent, Canadian Ex. Co., Liverpool, England.

H. Campbell Oswald, Assistant Secretary, C.P.R., has been appointed Secretary, Dominion Ex. Co., Montreal, vice A. R. G. Heward.

Billet, Seigle and Co., Grenoble, and the Agence Lubin, St. Etienne, France, have been appointed receiving agents in the respective towns for the Dominion Ex. Co.

The Dominion Ex. Co. has opened offices at Arthurette, N.B., Baxter and Sherwood, Ont., Tregarva, Sask., and Colwood, Fitzgerald, Malahat and Port Alberni, B.C.

The Quebec Public Utilities Commission has dismissed the application of the town of Montcalm, for an order directing the Dominion and American Ex. Cos. to deliver parcels and packages within the limits of the municipality, on the ground that it has no jurisdiction to deal with the matter, as express companies are under the jurisdiction of the Board of Railway Commissioners for Canada.

The Canadian Northern Ex. Co. has issued instructions to its agents at transfer points, to the effect that they must not accept in local transfer nor on through waybills, any shipments waybilled or transferred, with charges to collect, when the packages are marked prepaid, either by the originating company's regular sticker or in any other legible manner to indicate that charges were paid in advance. The company offering the shipment in transfer must correct the billing or the entry on the transfer sheets to agree with the marks on the package.

The Dominion Ex. Co. has instructed its agents at common points with the Canadian and Canadian Northern Ex. Cos., that in case of shipments from points on either of the two lines mentioned, and which have to be handed back again to the originating company to complete transportation, it will be necessary for the agent at the point where the waybill is handed back to the initial company, to keep a record showing the name of the company, the number and date of the waybill, where from, where to, particulars of shipment, weight and charges, and the point at which waybill was originally transferred to the Dominion Ex. Co. A monthly report of such transfers, signed and dated by the agent, and showing the name of the office, must be sent to the audit office, using, in the meantime, form 53, and retaining an impression copy.

The Dominion Ex. Co. has notified its agents that on presentation of Government warrants properly filled out and signed in the space provided at the head of the form for the signature of the officer issuing the requisition, the person delivering the shipment also signing his name at the foot of the form, agents will accept and forward on regular waybills, shipments of military supplies, equipment, etc. The charges must be billed prepaid, and the Government warrant or requisition, together with a copy of the waybill, must be expensed on the agent at Ottawa for collection. In case of shipments to points on connecting lines, with which the company has a regular freight interchange, the charges to destination must be shown as prepaid, settlement with such lines being made in the usual manner. A separate warrant or requisition must be presented for the transportation of horses, stores, etc., such document to cover the actual movement from any one station to one destination only. One warrant or requisition will not be accepted to cover movement to camp and return, but a separate document must be obtained to cover movement each way when necessary.

Among the Express Companies.

F. H. McGarrett has been appointed agent, Dominion Ex. Co., Cobalt, Ont., vice G. Sims.

Marine Department

The Dry Dock at Port Arthur, Ontario.

By A. V. Powell, M. Am. Soc. C.E.

Thunder Bay, on Lake Superior, is a body of water 16 by 26 miles in extent. It forms one of the best harbors—if not the best—on the great lakes. It is connected with Lake Superior by two outlets, two and four miles in width, and is protected from the winds by the palisades of Thunder Bay and Pie Island, 1,200 and 1,500 ft. high. The cities of Port Arthur and Fort William are located on the northern shore of the bay, near the western end, and except in name form a single commercial centre, the only port on the Canadian side of Lake Superior. To this port the three great transcontinental railways bring the products of the grain fields of central western Canada, and to it also the shipping of the great lakes carries the manufactured commodities and fuel for the great northwest. Ships encounter storms and meet with disasters, hence dry-docks are needed for repairs. Ships are lost, and more ships are needed to carry the increasing traffic, so shipyards are required. These needs account for the formation of the Western Dry-Dock and Shipbuilding Co., Ltd., of Port Arthur, Ont.

LOCATION OF DRY-DOCK.—In order to carry out the proposed undertaking in the manner that the enterprise seemed to justify, and to provide room for extending the facilities when the growth of business required, about 100 acres of land were needed, so located as to give not less than half a mile of dock frontage for dry-docks, shipbuilding berths, fitting-out slips, etc., and room in front for laying up ships for repair during the winter. In addition to this, an absolutely safe foundation must, if possible, be secured for the dry-dock. The site must also be as near as possible to the shipping centre of the district.

rent River site for the plant. This location met all the conditions mentioned above in regard to foundations, water front, area and railway facilities, and was sufficiently near the shipping district.

Very complete borings were taken

boulders. About 90% of the material excavated was hard-pan. The remainder was shale rock.

CONCRETE.—The nature of the foundation precluded the use of timber in the construction of the dock, even had it been otherwise desirable, and concrete

Concrete Dry Dock at Port Arthur.

over the property before the docks were located (room having been reserved for another dock of the same size as the one constructed, and served by the same

was adopted. A 1:3:5 mixture was used, which was run soft in the large masses, side walls, portal piers, etc. It was dumped from cars running over the top of the forms, the drop ranging from 5 to 30 ft., and I believe resulted in a mass as nearly voidless as it is possible to get concrete. Timber was used for keel and bilge blocks, but not elsewhere.

DIMENSIONS OF DOCK.—In fixing the dimensions of the dock we were governed to a degree by past experience. The first dry-dock I designed was constructed in 1891. At that time, after much thought on the part of the owners, and after getting the opinions of vessel men, we concluded that 400 ft. would dock any ship that would ever be built on the lakes. I have since lengthened that dock 150 ft., but it is now altogether too short to take the largest boats. The largest ships on the great lakes at present are 600 to 608 ft. long over all, 60 ft. beam and 32 ft. deep. They draw (aft) light about 12 ft. of water. A ship of these dimensions will have about 450 ft. of dead flat frames, that is, frames of the same dimensions as the midship section. The "dead rise" will not exceed 6 ins. and the turn of the bilge 4 ft.

In other words, the vessel is a steel box sharpened at the ends and rounded at the lower corners. As a carrier it cannot be excelled. Its model is the outgrowth of the combined experience of shipbuilders and vessel owners covering a period of 30 years, and it is fair to presume that the type will continue. It is admitted by the majority of experts that the length of the lake boats cannot be increased very much without increasing the depth of the hull, thereby increasing the weight, and consequently

Fig. 1. Sections of the Port Arthur Dry Dock.

With these requirements in mind, nine locations were prospected, covering a bay frontage of seven miles. At all these points borings were made, and where satisfactory foundation was found preliminary estimates of cost were prepared. Finally a report was submitted, which was adopted, fixing on the Cur-

pumping plant). The place fixed upon put about two-thirds of the length of the docks outside the original shore line, the portal of the present dock being where the water was about 10 ft. deep.

FOUNDATION.—The entire dock is built on solid rock. Above this was found the hardest kind of hard-pan, with many

the draft of the ship. As the ships operating on the lakes are now loaded to the full working depths of the channels and harbors no material benefit can be obtained from increased size without the expenditure of unknown millions for harbor improvement.

However, there is always the man who

Stranding of the s. s. Queen City.

The following judgment re the stranding of the s.s. Queen City at Dunsmuir point, near Alberni, B.C., Dec. 10, 1911, was delivered recently by Capt. Jas. Gaudin, agent, Department of Marine,

Fig. 2. Plan of the Port Arthur Dry Dock.

wants the biggest of everything, and he is liable to come to the front with a ship in advance of the harbor appropriations. So we made the Port Arthur dock 700 ft. long to give him a chance to come in. This length also gives a chance to dock at one time two vessels of a class largely in use. The width of the dock on the bottom was fixed at average 85 ft. This admits light, gives ample room for working, and a clear passage for material going into the dock.

The sidewalls are given a moderate amount of batter for two reasons. First, as the spaces on both sides of the dock are to be used as building berths (ships 600 ft. or more in length will be launched into this dock), the walls are kept back so that the ship's bilge will not strike when it is launched. Second, the modern ship in dry-dock rests entirely on the keel and bilge blocks and shores are unnecessary. For this reason the altars used in the old dry-docks are also unnecessary. Provision is made, however, for shoring by stepping into the side walls at intervals near the top of the dock.

PORTAL AND CAISSON.—The clear width in the portal at the line of the sill is 72 ft. and the depth over the sill is 16 ft., Government datum. This gives ample depth, as loaded ships are never docked in lake dry-docks. The sill and jambs are steel. The caisson is constructed of steel, and its dimensions are given in fig. 3. It was erected in place between the piers of the portal.

PUMPING PLANT.—The pumping plant consists of two 30-in. centrifugal pumps driven by 200 h.p. d.c. vertical direct-connected motors. There is also an 8-in. centrifugal motor-driven pump for drainage. The pump well is located in the west pier of the portal and is provided with openings and valves to connect with dock no. 2 when that becomes necessary. Current for the motors driving the pumps and also the machinery of the shipyard is taken from the Current River hydro-electric plant owned by the city of Port Arthur and located alongside the dry-dock property.—Engineering News.

We are indebted to the contractors, the Canadian Stewart Co., Ltd., for the photograph from which the half tone il-

lustration showing the interior of the dry dock is made.

court does not deal with the officer's certificate, owing to his previous good record, but he is cautioned to be more careful in future to see that his orders to the helmsman are more particularly carried out.

The court cannot agree with the apparently ill-advised arguments put forward by counsel representing the Victoria Shipmasters' Association in making the statement that an officer in charge of a vessel would be guilty of negligence were he to satisfy himself that the actions of the helmsman were in accordance with his orders. Such an argument, if accepted, would be against all nautical precedence and diametrically opposed to seamanship having regard to the safety of life and property.

The Soo Dredging and Construction Co., Ltd., has been incorporated under the Dominion Companies Act, with \$100,000 capital and office at Sault Ste. Marie, Ont., to carry on a general dredging, towing, freighting, drydocking and construction business.

International Water Lines Passenger Association.

At the annual meeting in Detroit, Mich., recently, B. W. Folger, General Manager of the Niagara Navigation Co., on behalf of himself and G. Poole, Jr., of Chicago, presented the retiring President, T. Henry, Traffic Manager, Richelieu and Ontario Navigation Co., with a gavel. The handle of the gavel consists of a part of the steamboat Chicora, originally a blockade runner in the war between the Northern and Southern States, her name being Let Her Be. After the war she was brought to the Great Lakes and converted into a passenger vessel. She was the first steamboat owned by the Niagara Navigation Co., and was the mother of the present fleet of steamers plying between Toronto and Niagara River. Owing to her exceptionally strong construction she is still a popular passenger steamer on Lake Ontario. In the head of the gavel there is a part of the steamboat Cayuga, the latest addition to the N.N. Co. fleet. There is also a portion of the new steamboat Detroit III., building at Detroit for the Detroit and Cleveland Lines, and the largest ship of her class. Also a portion of the Washington Irving, recently contracted for by the Hudson River Day Line, which will carry 6,000 people, this being by far the largest certificate issued in the world. There is, in addition, a part of the twin screw river steamboat under construction at Toledo for the Thousand Islands Steamboat Co.

The following lines were admitted to membership:—Catskill Evening Line of

Steamers, Coburn Steamboat Line, Crawford Trans. Co., Casco Bay and Harpswell Lines, Manhattan Nav. Co. There are now over 50 member companies.

Officers were elected as follows:—President—A. A. Heard, G.P.A., Champlain Trans. Co., Albany, N.Y.; Vice President—J. V. Foy, G.P.A., Niagara Navigation Co., Toronto; Secretary—M. R. Nelson, C.C., P.D., Northern S.S. Co., 1184 Broadway, New York, N.Y.; Executive Committee—C. F. Bielman, T.M., White Star Line, Detroit, Mich., 2 years; L. G. Lewis, G.P.A., Detroit and Cleveland Navigation Co., Detroit, Mich., 1 year; and J. Foster Chaffee, A.G.P.A., R. and O.N. Co., Toronto, 1 year. M. R. Nelson, C.C., P.D., Northern Steamship Co., New York, was re-elected Secretary, and the appointment was made permanent.

The Niagara Navigation Co. has been authorized by supplementary Dominion letters patent to increase its capital stock from \$1,000,000 to \$3,000,000.

The Iroquois-Noname Collision.

Following is a summary of the judgment re the collision between the International Steamship Co.'s s.s. Iroquois, under charter to the C.P.R. for its Pacific coast passenger service, and the steam tug Noname, off the Fraser River sandheads, Oct. 22, 1911, delivered recently by Capt. Jas. Gaudin, agent, Marine Department, Victoria, B.C., and concurred in by C. Eddie and W. Ladds, as nautical assessors.

The court finds that both vessels were approaching each other without any material change of bearing, a risk of collision existed, and both vessels acted either in ignorance or otherwise of article 16, International Rules of the Road, which provides under certain circumstances for the stopping of the engines, and cautious navigation, until the risk of collision is passed. Neither vessel made use of the signal prescribed by law, to indicate the direction it intended to take. At the time of collision the Iroquois was travelling at about 13 knots an hour and the Noname at approximately six knots an hour in the opposite direction, and the court is of opinion that the collision was entirely attributable to the speed at which the vessels were being navigated, and holds that both were at fault for non-compliance with the rules of the road. The court considers that the action of the officer in charge of the Iroquois in maintaining what is considered an excessive speed, under the circumstances, and in such a locality, contributed largely towards bringing about the collision, and refrains from commenting on the internal economy or discipline of the vessel, as she is of foreign register, but states that the use of the danger signal made by the Iroquois is not recognized in Canadian coasting waters. After giving full consideration to the matter of the master of the Noname, the court considers a reprimand sufficient. The court does not acquiesce in the idea generally prevalent amongst local navigators of the Pacific coast, that in order to make their courses good in foggy weather, they must maintain a comparatively high rate of speed. Assuming that those in charge of these vessels are conversant with the rate and direction of the tidal currents, recourse should be had to a simple problem in current sailing, which would justify a reduction of speed.

The Sealing Steamship Nascopie.

This vessel, which has been built at Wallsend-on-Tyne, Eng., to the order of Job Bros., Liverpool, Eng., in conjunction with the Hudson's Bay Co., and which will be employed in the Newfoundland seal fishery and in the H. B. Co.'s work in Hudson Bay, made her trial trip on the Tyne Jan. 24.

She is excessively strongly built of steel, and her form, strength and details of construction embody the latest practice for vessels intended to work amongst thick ice. Her stem is so formed that when she charges the ice she will glide upon it and crush it under her weight. The machinery, shafting and propellers have all been made specially heavy in order to cope with the shocks that she must receive amongst the ice. She is 285 ft. long by 43½ ft. beam by 29½ ft. deep, and will carry 2,500 tons deadweight. The machinery consists of a set of triple expansion engines, supplied with steam by two boilers working under forced draught. On the trial trip, although the sea was rough and the weather decidedly unfavorable, she attained a speed of over 14 knots, being considerably in excess of the contract requirements. She has been constructed to attain the highest class at Lloyd's, and has comfortable accommodation for the navigating staff, engineering staff

and crew. She will also, when necessary, accommodate nearly 800 sealers.

The owners were represented on the trial trip by R. and T. B. Job and by Mr. Ingram, of the Hudson Bay Co.

After her trials, she left for Cardiff, where she shipped coal for St. John's, and also took on board the shipwrecked crew of the Newfoundland brig Bella Rosa, which was lost in mid-ocean recently. She sailed from Cardiff for St. John's, Feb. 7, arriving Feb. 14.

The Behavior of Water in Advance of a Steamboat on the Niagara River.

J. L. Jones, Assistant Professor of Mechanical Engineering, Oklahoma Agricultural and Mechanical College, writes: "The recent collision between the s.s. Olympic and H.M.S. Hawke has aroused considerable interest among engineers, and has brought to light many observations that have been appearing in the periodicals for some little time past. These things are not necessarily discoveries, but, rather, buried knowledge—things that have been seen so often and have become so familiar to the people who have lived among them that they had come to believe them to be known equally well to everyone. It is the same with many things in the engineering line; occurrences become so familiar that their importance is not appreciated.

"On the Niagara River there is a ferryboat that has been running between the foot of Ferry St., Buffalo, N.Y., and Fort Erie, Ont., for many years. Every time this ferryboat approaches its dock on the Canadian shore it causes a peculiar action of the water in its immediate vicinity. The water immediately offshore is very shallow, the depth reaching probably 4 ft. at a distance of about 50 ft. out. At this point there is a very steep bank, and in the next few feet out from the shore the depth of the water increases very rapidly so that the dock did not have to be extended very far out, as the boat could run right along the edge of the deep water. There is considerable current in the deeper part of the river just outside the dock, but on the 'shelf,' where the water is only 4 ft. deep, there is very little current owing to a projecting ice-breaker farther up the river. As the ferryboat approaches the dock, heading up the river as it always does, the water on the shelf begins to recede from the shore, the motion becoming faster and faster until the shelf is practically dry. So dry, in fact, that the children used to (and probably do now) run out from the shore after the water a distance of about 40 ft. They would be driven back by the wave which followed the boat and which would carry the water farther up on the beach than it was before. This same phenomenon occurred with either a screw propeller or a side-wheeler."

True Bearings to be Introduced.—The Department of Marine notifies that beginning with Jan. 1, true, or astronomic, bearings are being given in all notices to mariners issued. The bearings will be given in degrees, true, or astronomic, reading from 0 to 360, measured clockwise. These bearings may be followed by magnetic bearings, in degrees, in brackets. Where applicable all bearings will be given from seaward. In the forthcoming edition of the Canadian list of lights and fog signals, corrected to Apr. 1, true bearings only will be given, numbered from 0 at north, measured clockwise to 360.

The Civil Service Commissioners received applications, to Mar. 1, for the position of assistant to the Chairman of Steamboat Inspection at a salary of \$2,100 a year.

Canadian Notices to Mariners.

The Department of Marine has issued the following:—

5. Jan. 27. 6. New Brunswick, south coast, Bay of Fundy, St. John harbor entrance, off southeast end of Partridge island, gas and whistling buoy to be permanently withdrawn. 7. New Brunswick, south coast, Bay of Fundy, approach to St. John, off Black Point, whistling buoy to be replaced by gas and whistling buoy. 8. Nova Scotia southwest coast, Frenchman point to Wedge point, buoys established, Goose bay, stakes placed. 9. Nova Scotia, Cape Breton island, Bras d'Or Lake, Barra strait, Derby point, name of lighthouse. 10. Newfoundland, south coast, Placentia bay, Placentia road, Verde point lighthouse station, fog alarm established. 11. Canada, Hudson bay, off Fullerton harbor, Barrel island, beacon rebuilt.

6. Jan. 30. 12. Quebec, Lake St. John, east side, Grande Decharge, Mistook, lights established. 13. Quebec, River St. Lawrence, Lanorale to Ile Deslauniers, Repentigny channel, buoys renumbered.

7. Feb. 5. 14. British Columbia, Strait of Georgia, Active pass, Mayne island, Georgian point, change in fog alarm. 15. British Columbia, North Skeena passage, Inverness, Mid rock, conical buoy replaced by spar buoy. 16. British Columbia, Dixon entrance, Queen Charlotte islands, Langara island, lighthouse and fog alarm under construction.

8. Feb. 8. 17. Nova Scotia, Bay of Fundy, Chignecto channel, Joggins Mines, lighthouse established. 18. Nova Scotia, south coast, entrance to Halifax harbor, Sambro outer bank, lightship placed for winter months. 19. Nova Scotia, Cape Breton island, east coast, South Ingonish, wooden spar buoys replaced by iron buoys.

9. Feb. 10. 20. Ontario, Detroit river, lower end, changes in buoyage. 21. Ontario, Lake Superior, Michipicoten harbor, Little Gros Cap, hand fog horn at light station.

11. Feb. 20. 24. British Columbia, Vancouver Island, west coast, Quatsino sound, Entrance island, hand fog horn at light station. 25. British Columbia, Strait of Georgia, sandheads of Fraser river, change in position of gas and whistling buoy, change in position of light ship.

Farrar Transportation Company's Report.

The report of operations for 1911, which was presented at the annual meeting, at Collingwood, Ont., Jan. 30, showed gross earnings of the steamboats Collingwood and Meaford, \$119,082, and expenses of all departments, \$74,357. The assets are \$442,815.37, and total liabilities \$358,045.75. A dividend of 10% was declared. T. I. Thompson, President, in presenting the report, suggested that the construction of another steamboat be considered for the 1913 season. The following is the board for the current year:—President, T. I. Thompson, Owen Sound, Ont.; Vice President, E. R. Wayland, Fort William, Ont.; Secretary-Treasurer and Manager, G. E. Fair, Collingwood; other directors—E. Stubbs, Sault Ste. Marie; W. E. Allen, Toronto; W. T. Toner, G. P. Pearsall, Collingwood; M. Snetsinger, Thornbury; J. Shultis, Port Colborne, Ont., and D. D. Lewis, Philadelphia, Pa.

It is announced that a bill will be introduced into the British House of Commons shortly to authorize the construction of a railway and harbor at Galway, Ireland, with a view to the establishment of a quick Atlantic route between Galway and Halifax, N.S. It is claimed that the passage by this route can be made in from 2¼ to 3½ days.

Dominion Marine Association's Annual Meeting.

The Association's annual meeting was held in Ottawa Feb. 14, the President, Frank Plummer, of the Canadian Lake Transportation Co., in the chair.

The report of the executive committee showed that the membership, as well as the tonnage, had steadily increased, there being enrolled a registered steam tonnage of 150,364 tons and barge tonnage of 37,269 tons, making altogether 187,633 net registered tons, as against 175,594 net registered tons in 1910. The report dealt very fully with the past year's work, including the coasting laws, pilotage, St. Lawrence River power schemes, the grain trade (including the Montreal Harbor Commission, the Lake Shippers Clearance Association, trimming spouts on elevators, and trimming charges, the grain act shortages, bill of lading), entrance to Soulanges canal at Coteau, the Morrisburg canal upper entrance, G.T.R. air line bridge, Welland canal, Sault Ste. Marie lock, handling lines at canal entrances, opening of canals on Sundays, examinations and educational facilities for masters and mates, sick mariners dues, and U.S. tonnage tax in U.S. ports. Dominion legislation (including bill of last session to amend the Shipping Act, bill respecting wireless telegraph system on vessels, loadline bill, bill to amend the Water Carriage of Goods Act, bill respecting the pollution of navigable waters, the waterways treaty, the reciprocity measure and the grain bill), low water in the lakes and St. Lawrence, the Lighthouse Board, the Canadian Lake Protective Association, Fort William harbor, proposed harbor basin at Sarnia, Port Arthur harbor, dredging at Byng Inlet, eastern entrance Toronto harbor, Telegraph channel, Bay of Quinte, Salt Point channel, Kingston harbor, closing of navigation in 1911, aids to navigation.

The association's committee on aids to navigation presented a separate report, stating that a general list of recommendations had been submitted to the Lighthouse Board of Canada early in the year, that further requests had been submitted at later dates, and that favorable action had been taken in the majority of cases. The recommendations made and the action taken were set out in detail.

The reports having been adopted the unsatisfactory condition of affairs at Port Arthur and Fort William, and the great delays to vessels in loading there were discussed at considerable length, a committee, consisting of J. Playfair, F. Plummer, A. A. Wright, L. Henderson, and the Association's Counsel, F. King, being appointed to take the whole matter up with the Lake Shippers Clearance Association, with power, unless more satisfactory arrangements can be made with that association, to appoint other agents. It was the unanimous opinion that all surrenders should be in before the time fixed for a vessel's arrival to load.

The incoming executive committee was instructed to lay before the Dominion Government, particularly the Ministers of Railways and Canals, and of Public Works, the urgent necessity of widening and deepening the channel in the St. Marys River at Sault Ste. Marie approaching the entrance to the Canadian locks, particularly from a point east of the ferry dock to a point west of the New Ontario dock in line with the front of the ferry dock. This would widen the channel and eliminate the possibility of strandings, such as experienced by the steamboats Wexford and Turret Crown, and would greatly benefit Sault Ste. Marie harbor by making the Government dock and the New Ontario dock more easy of access. This applies particularly to the New Ontario dock, which

is in general use by Canadian ships for fueling purposes, and it would be of great benefit to all boats of Canadian passenger and package freight lines making Sault Ste. Marie a port of call.

The following were appointed a committee on aids to navigation:—S. C. Calvin, J. Donnelly, W. H. Featherstonhaugh, R. Fraser, J. B. Foote, H. H. Gildersleeve, D. Noonan, C. J. Smith, A. A. Wright, J. Playfair.

Under the bylaws four members of the executive committee retired, but were eligible for re-election, viz.: A. E. Mathews, S. C. Calvin, D. Murphy, and J. W. Norcross. Two other vacancies were caused by the death of G. B. Greene, and the resignation of J. P. Kavanagh. The following were elected to fill the vacancies:—A. E. Mathews, D. Murphy, J. W. Norcross, F. S. Wiley, A. A. Wright, L. Henderson.

The dues in the Association for the current year were fixed at 2½¢ a ton.

Officers were elected as follows:—President, J. Playfair, Midland, Ont.; First Vice President, D. Murphy, Ottawa; Second Vice President, L. Henderson, Montreal.

Deputation to Dominion Government.

The various representatives of steamship companies attending the meeting formed a deputation which was received in the House of Commons railway committee room in the morning by the Minister of Railways and Canals, the Minister of Marine, and the Minister of Public Works. The deputation was introduced by W. F. Nickle, M.P. for Kingston, Ont., and the ministers were addressed by the Association's Counsel, F. King, who urged that the lower St. Lawrence canals be repaired earlier each year, so that they could be opened earlier, and that the Welland and St. Lawrence canals be opened for traffic on Sundays. Recommendations were also made in reference to wrecking boats and tugs with tows of logs being allowed to carry passengers without license; to the necessity of better arrangements for the handling of lines at entrances to the canals, and to changes desired in the arrangements for the examinations of masters and mates. It was also strongly urged that in any power developments on the rivers or canals the navigation interests should be paramount.

Dinner at Ottawa Golf Club.

In the evening the representatives attending the meeting, accompanied by a number of guests, went by special cars on the Hull Electric Ry. to the Ottawa Golf Club, a beautifully situated and splendidly appointed building where they dined amid most charming surroundings. J. Playfair, President-elect of the Association, occupied the chair. The speakers in connection with the various toasts included Hon. G. E. Foster, Minister of Trade and Commerce, who emphasized the duty of his department to secure an increase of interprovincial, as well as external trade; Hon. J. D. Hazen, Minister of Marine, who dealt at length with his department's work for the marine interests, and with the great improvements made in aids to navigation, etc.; G. A. White, A.G.M. Hudson River Day Line, President of the Association of Passenger Steamboat Lines; A. A. Schantz, General Manager, Detroit and Cleveland Navigation Co.; W. F. Nickle, M.P. for Kingston, Ont.; D. Murphy, President Ottawa Transportation Co.; A. A. Wright, Managing Director, St. Lawrence and Chicago Steam Navigation Co.; F. Plummer, Vice President, Canadian Lake Transportation Co.; F. Cooke, ex-mayor of Ottawa; F. King, the Association's Counsel; Messrs. Prindiville, Hopkins and Dart, of underwriting firms, and Acton Burrows, Managing Director, The Railway and Marine World.

Richelieu and Ontario Navigation Company's Annual Report.

Following are extracts from the report for the year 1911 presented at the annual meeting in Montreal Feb. 19:—

	1911.	1910.
Gross receipts	\$1,556,159.84	\$1,437,931.42
Operating expenses ...	1,050,289.50	1,016,233.23
Fixed charges, interest, etc.	57,629.44	58,582.50

Net profit\$448,240.90 \$363,115.69

The following quarterly dividends were paid:—March 1, 1½%, \$46,980.00; June 1, 1½%, \$46,980.00; Sept. 1, 1½%, \$72,505.98; Dec. 1, 2%, \$105,106.58; total, \$271,572.56.

The authorized capital stock has been increased to \$10,000,000. The paid-up capital has been increased by \$2,179,875, to provide for the natural expansion of the company and the purchase of the Northern Navigation Co.

During the year \$24,333.33 of the outstanding debentures have been redeemed and cancelled.

The insurance fund has been credited with \$36,000 out of the year's earnings and \$275,939.98 now stands to the credit of this account. This fund is in addition to the general insurance carried with insurance companies on shore properties, steamers, etc.

The new steamboat Rapids Prince for the Rapids Division, completed and delivered in Sept., 1910, went into commission June 1, 1911, and is fully up to expectations and requirements.

The twin-screw passenger and freight steamboat Saguenay, built on the Clyde, arrived from Glasgow under her own steam, June 26, 1911, and has run, in through service, direct from Montreal to Quebec, Murray Bay, Tadoussac and the Saguenay River, in connection with the hotel and tourist traffic and has proved very satisfactory.

The company's hotels, the Manoir Richelieu and Tadoussac, were very well patronized during the season.

Your company acquired control of the Northern Navigation Co. by the purchase of 9,648 fully paid-up shares of the capital stock, amounting in all to 10,000 shares. Your directors are pleased to report that the acquisition of this company is proving of material benefit.

The company has a fleet of 21 steamboats, ferries and tugs, with an aggregate tonnage of 36,713.

ASSETS.	
Steamers, real estate and buildings, docks, wharves, etc.	\$4,774,396.11

Dividends	\$271,572.56
Carried to insurance fund	36,000.00
Written off steamboats, depreciation, etc.	92,883.90
Net surplus	439,249.13
	\$839,705.59

At the Western Canada Railway Club's monthly meeting in Winnipeg, Feb. 19, a paper was read on the value of statistics by D. C. Coleman, acting General Superintendent, Manitoba Division, C.P.R.

Canadian Lake Protective Association's
Annual Meeting.

The first annual meeting was held at Ottawa, Feb. 14. The report presented by the committee dealt fully with the reasons for the formation of the Association. One result of its work is covered in the following paragraph:—"The English underwriters were the first to give the Association full recognition, and announced in good time a rate of 5 3/4 % as a basis rate for vessels belonging either to this Association or to the Great Lakes Protective Association of Cleveland. Both associations were thus placed exactly on the same basis and at a rate which was 1/4 % better than the basis rate of the preceding year. On the other hand, underwriters in New York, for various reasons which are not pertinent to this report, hesitated in coming to a conclusion. Ultimately they announced for members of the Canadian Association the same rate quoted in the English market, but as a concession to the United States organization at Cleveland, announced a rate for their vessels of 5 1/2 %, or 1/4 % less than that quoted for Canada. The result naturally was that members of the Canadian Association placed insurance so far as possible in the English market, where they received equal recognition with the Great Lakes Protective Association. Some fleets, however, had a good deal of their insurance covered in New York, and these suffered the discrimination of 1/4 of 1 % mentioned, to the extent to which they covered their risks there. Underwriters later announced that full recognition was withheld only until the Association should get in full working order, and prove that it could carry out its present intentions."

Reference was made to the establishment of casualty reports, and to the prevention of overloading. "During the year six masters and one engineer were censured by the committee. In addition, three masters and two mates have been summarily dismissed, and with the assistance of the Wreck Commissioner's court the certificates of two of the masters have been suspended. One case was referred to the Great Lakes Protective Association, as the offending vessel belonged to that organization. The complaint so far as known received no attention. A few cases are still under the committee's consideration.

"The cases in which the assistance of the Wreck Commissioner has been invoked are the wreck of the Turret Cape, the stranding of the Corunna on one of the Welcome Islands, the accident to the Emperor at the Sault Ste. Marie lock, and a collision between the Haddington and the Keystorm in the Cornwall canal. The first two cases are those in which the certificates were suspended as above stated, and these are two of the cases in which the men were dismissed by the owner. The investigation regarding the Haddington and Keystorm was asked for in the hope of settling questions regarding the proper method for meeting boats to pass each other in canals, but has not yet been held. In the Emperor case, the master was absolved and a set of rules has resulted to govern the locking of boats at Sault Ste. Marie, Ontario.

"The committee deeply regrets that the stranding of the Turret Cape, under circumstances which seem to afford no reasonable excuse for those in charge of her, should occur in a season which would otherwise have recorded no total loss. As it is, there is room for congratulation that the stranding of the Corunna, with one or two fairly serious casualties, including the breaking of the gates at lock 21 in the Welland canal, are the only other substantial disasters

Lake Grain Shipments.

The following statement, prepared by F. Symes, acting Grain Inspector, Fort William, Ont., shows the bushels of grain shipped by vessels from Fort William and Port Arthur, Ont., during the 1911 navigation season, from April 21 to December 10, compared with similar figures for 1910. The figures in each column, after the period, represent lbs.

1911	Wheat	Oats	Barley	Flax
Canadian vessels to Canadian ports.....	37,403,216.50	20,331,245.18	1,311,923.22	598,379.00
Canadian vessels to Foreign ports.....	997,068.40		195,000.00	
Total Canadian Vessels.....	38,400,285.30	20,331,245.18	1,506,923.22	598,379.00
Total Foreign vessels to Foreign ports.....	32,648,076.10	1,191,348.05	788,615.29	621,119.26
Total shipments, 1910.....	70,948,361.40	21,522,593.23	2,295,539.03	1,219,498.26
Canadian vessels to Canadian ports.....	38,343,487.30	15,411,522.24	1,041,698.41	471,564.10
Canadian vessels to Foreign ports.....	1,772,153.10	382,948.24	62,965.10	480,960.16
Total Canadian vessels.....	40,115,640.40	15,864,771.14	1,104,664.03	952,524.26
Total Foreign vessels to Foreign ports.....	16,610,800.00	479,630.11	495,667.46	2,138,193.34
Total shipments.....	56,756,440.40	16,344,401.25	1,600,331.46	3,090,718.04

In addition to the foregoing, 451,106.50 bushels of wheat screenings, 2,697.18 bushels of flax screenings and 3,964.09 bushels of rye were shipped in foreign vessels to foreign ports, during 1911.

to record in which fault could be found with navigators. In one or two rather serious cases pilots specially engaged were at fault.

"The committee believes that the Association has already proved its efficiency for the purpose for which it was designed, and that the direct supervision of the navigation of all vessels enrolled, the recording of all faults and the punishment of all culpable negligence will have a distinctly beneficial effect and tend to reduce the ratio of losses to premiums very materially. It is, however, essential that there should be no half-hearted support of the policy adopted, and that on the other hand the members of the Association should assist in every way in forwarding the work of the committee."

ANALYSIS OF ACCIDENTS, 1911.	
Strandings	5
Groundings	18
Collisions	18
Striking obstructions	5
Striking locks or lock gates	6
Striking bridges, docks, piers and banks.....	19
Burning boilers	1

Fire in lamp room	1
Overran her own anchor	1

Total

Three broken or fouled transmissions included in above.

The following were elected as the committee for the current year:—J. Playfair, F. Plummer, S. Crangle, R. Fraser, J. W. Norcross, W. H. Featherstonhaugh, H. H. Gildersleeve, J. T. Mathews, C. A. Jaques.

Niagara Navigation Company's Official
Organization, Etc.

Consequent on the absorption of the Hamilton Steamboat Co. and the Turbine Steamship Co. by the Niagara Navigation Co., the latter's staff of officials has been somewhat augmented. The following N.N. Co. officials continue in their respective positions:—B. W. Folger, General Manager; J. M. Sullivan, Secretary; R. H. McBride, Treasurer; J. V. Foy, General Passenger Agent; S. J. Murphy, Travelling Passenger Agent; H. E. Weller, City Ticket Agent; J. Sullivan, Chief Steward.

W. E. Bishop, heretofore General Manager, Turbine Steamship Co., has been appointed General Agent, N.N. Co. at Hamilton; J. A. Goodearle, heretofore Manager Turbine Steamship Co., has been appointed General Freight Agent, N.N. Co. at Toronto; J. P. McConnell, heretofore City Ticket Agent, Turbine Steamship Co., has been appointed Assistant Freight Agent, N.N. Co., at Toronto.

The route between Toronto, Niagara-on-the-Lake, Queenston, Ont., and Lewiston, N.Y., will be served by the

Corona, which will open the season, to be followed by the Chippewa and later by the Cayuga. Plans are being prepared for another vessel which will not probably be ready before 1914. The Toronto-Hamilton service will be opened by the Macassa; the Modjeska and the Turbinia will be put on as the season advances. The Chicora will be put on the route from Toronto to Olcott, N.Y., about the middle of June.

Cunard Steamships for Canadian Trade.

The Cunard Steamship Co. has ordered two steamships at Plymouth, Eng., for its Canadian service. The dimensions will be, approximately—length 538 ft., beam 63 3/4 ft., depth 46 ft. to shelter deck, with a gross tonnage of about 13,000 tons. They will be twin screw driven, and the equipment will include all the most modern improvements for the comfort and safety of passengers. Superior accommodation will be provided for 500 second class passengers, and approximately 1,500 third class passengers, the latter accommodation being arranged in two and fourth berth rooms. The machinery will consist of two sets of quadruple expansion engines, balanced on the Yarrow, Schlick and Tweedy system, with cylinders 26, 37, 53 and 76 ins. diam., by 54 ins. stroke, supplied with steam by double ended boilers.

The Northern Navigation Company's
Annual Meeting.

The Northern Navigation Co.'s annual meeting was held Jan. 30, when the directors' report was adopted. Plans are in course of preparation for the building of a new vessel for the company's fleet, and it is expected that construction will be commenced in the spring. The following directors retired:—E. Bristol, M.P., W. G. Morden, T. P. Birchall and F. F. Pardee, M.P. The board for the current year is as follows:—President, Jas. Playfair, Midland, Ont.; First Vice President, J. R. Binning, Montreal; Second Vice President, C. J. Smith, Montreal; other directors, C. Caverhill, H. M. Molson, W. Wainwright, W. E. Davis, A. H. Sims and J. E. Dalrymple, Montreal; H. B. Smith, Owen Sound, Ont.; H. W. Richardson, Kingston, Ont.; and F. A. Magee, Hamilton, Ont.; H. H. Gildersleeve, Sarnia, Ont., continues as Manager; F. P. Smith, Secretary of the Richelieu and Ontario Navigation Co., Montreal, has been appointed Secretary, and C. A. Macdonald, Assistant Manager, has also been appointed Treasurer.

The net profits for 1911 were about \$152,000, or over 15 % on the total capital.

Trans-Atlantic Fast Steamship Service.

An Ottawa press dispatch of Feb. 19 stated that negotiations in progress between the Government and certain Canadian and English transportation companies operating trans-Atlantic steamships will probably result in the establishment of a new fast service between Canada and England. The proposals involve the formation of a new steamship company in which English capital will be interested, and which will be backed by the C.P.R., C.N.R., G.T.P.R., and the Allan Line. It is stated that the proposed company will put into service steamships with a speed of 24 knots an hour, thus shortening the time across the Atlantic to 4½ days, and involving an expenditure for new vessels of about \$30,000,000. A later dispatch stated that any such undertaking as that mentioned would be undertaken by the C.P.R. alone, neither of the other companies mentioned being concerned.

Atlantic and Pacific Ocean Marine.

The Quebec Steamship Co.'s s.s. Trinidad has been chartered for a voyage to the West Indies and the Panama canal in March.

The Union Steamship Co. of New Zealand's steamship, which is under construction for the Canada-Australia service, at Glasgow, Scotland, is expected to be ready early in 1913.

The Allan Line announces that it has arranged for vessels on its London route to call at Plymouth, the first being the s.s. Sicilian on Apr. 19, and after May 17 a call will be made there on each of the fortnightly trips between London and Quebec and Montreal.

Lamport and Holt of Liverpool, Eng., owning and operating steamships to various parts of the world, but chiefly concerned with the South American trade, have appointed D. E. Brown and Macaulay, Vancouver, B.C., as their agents for the Pacific coast.

Fanning Island, in the Pacific Ocean, is reported to have been sold to C. N. Armstrong and associates, Montreal, for \$350,000. It is stated to be the intention to make the island a free port, and to erect large wharves with all the necessary shipping facilities, oil tanks and coal bunkers for steamship service in connection with the Panama canal operation.

It is announced from Ottawa that the Government has decided to send out two engineering parties to make a hydrographic survey of the west coast of Hudson Bay before coming to any decision as to the adoption of either Port Nelson or Fort Churchill as the deep water terminus of the projected Hudson Bay railway. One party will go over the route by land and the other by water, the land party being expected to leave Winnipeg towards the end of February.

The Vancouver Board of Trade is asking the Dominion Government to grant a subsidy to the Canadian Mexican Pacific Steamship Co. for the service between Vancouver, Victoria and Salina Cruz, with permission to call at San Francisco. The former company operating this line was granted a mail subsidy on condition that the service was a direct one between B.C. ports and Salina Cruz. Two vessels are being run on a monthly schedule, but it is intended, if a subsidy is obtained, to make it a 21-day service.

The Dominion Line s.s. Southwark, which has been operating for several years between Great Britain and Canada and the United States, has been sold to ship breakers, the price paid being given as \$14,250. She was built in 1893 at Dumbarton, Scotland, and was equip-

ped with quadruple expansion engines with cylinders 25½, 37½, 52½ and 74 ins. diam., by 54 ins. stroke, 1,237 n.h.p. driving twin screws. Her dimensions were—length 477.9 ft., breadth 46.1 ft., depth 24.9 ft., tonnage 8,697 gross, 5,642 register.

The Allan Line has purchased the s.s. Romanic, formerly New England, from the Oceanic Steamship Co. She was built at Belfast, Ireland, in 1898, and is twin screw driven, with quadruple expansion engines, with cylinders 30, 50, 58 and 58 ins. diam., by 54 ins. stroke, 985 n.h.p. Her dimensions are—length 550.3 ft., breadth 59.3 ft., depth 35.9 ft., tonnage 11,394 gross, 7,410 register. For the past few years she has been operating between Mediterranean ports and Boston, Mass. It is stated that she will be re-named Scandinavian.

An Ottawa press dispatch states that on the completion of the projected Hudson Bay railway and the necessary terminal facilities at either Port Nelson or Fort Churchill, a responsible steamship company operating on the Atlantic will be prepared, provided a suitable arrangement is made, to establish a fast freight service to Great Britain by the Hudson Bay route. In the meantime, it is stated, the Government will send out an expedition to fix the exact route, marking straits and locations for light-houses and wireless telegraph stations, a start being made with this work this winter, to settle just how soon the passages are free.

Following on the recent visit of D. B. Hanna, Second Vice President, Canadian Northern Steamship, Ltd., to Great Britain, in connection with the arrangements for the forthcoming immigration season, an arrangement has been made with the Cunard-Thomson Line, whereby the Canadian Northern third class passengers, which the company is unable to accommodate on its vessels, will be taken by the Cunard-Thomson Line, the latter transferring to the former any surplus first class passengers. The Cunard-Thomson Line will continue to run from London and Southampton, probable also calling at Plymouth, and Bristol. The report that the Cunard Line is to absorb the Royal Line is without foundation.

The White Star s.s. Titanic, which is being built for the Atlantic trade, is scheduled to make her maiden trip in April and to leave New York again in April 20 for Plymouth, Cherbourg and Southampton. The masts and all four funnels are now erected, the machinery on board and the ironwork of the superstructure well advanced. The inside work is also proceeding apace. The first and second class passenger elevators are fitted, the floors are well advanced, and an interesting feature is the cementing and tiling of the swimming pond, which is progressing rapidly, as also the elaborate decorative work in the public apartments.

Muskoka Lakes Navigation and Hotel Co.—In our last issue, in referring to the annual meeting held in Toronto in January it was stated that J. S. Playfair, who had been President for several years, had retired and had been succeeded by H. C. MacLean, of Toronto. It has since been learned that Mr. MacLean and his associates control about 90% of the capital stock, which amounts to about \$170,000, having recently bought out most of the other interests at about 80% of the par value. The company does not issue a financial statement, but it is said that the transportation department made a net profit in 1911 of some \$25,000, while there was a loss of some \$500 on the Royal Muskoka Hotel, leaving a net profit on the whole operations of something over \$24,000.

Maritime Province and Newfoundland.

C. W. Seeley, Inspector of Steamboats, Halifax, N.S., died there Jan. 30, aged 64, after a short illness.

The plans for the year announced by the Governor of Newfoundland, at the opening of the Legislature, Feb. 14, include improvements in the fisheries, additional coastal steamships and better wireless and other telegraphic facilities.

The Navigation Syndicate, Ltd., has been incorporated under the New Brunswick Companies Act, with \$30,000 capital and office at Nordin, to own and operate steam and other vessels, and carry on a general navigation business.

The Dominion Government is reported to have awarded the contract for the construction of harbor works and improvements at Courtenay Bay, St. John, N.B., to Norton Griffiths, Ltd., of England, involving an expenditure of about \$7,500,000.

The Reid Newfoundland Co.'s s.s. Bruce, which has been built at Glasgow, Scotland, sailed from the Clyde, for St. John's, Nfld., Feb. 4, arriving Feb. 12, when she was immediately placed on her route between Port aux Basques and Sydney, N.S.

The dredging plant operated by A. and R. Loggie, Loggieville, N.B., is reported to have been sold, together with the Eastern Dredging Co.'s plant, to J. F. Gleason, T. Nagle and H. McInerney, for about \$250,000. The headquarters of the new concern will probably be at Newcastle.

Crosbie and Co.'s sealing steamer Sagona, which has been built at Dundee, Scotland, was expected to arrive at St. John's, Nfld., towards the end of February. Her dimensions are: length, 175 ft.; breadth, 28 ft.; depth, 13½ ft.; tonnage, 700 gross, and she is equipped with triple expansion engines for a speed of 12 knots an hour.

It is reported from Ottawa that the Government intends to appoint a commission of three to investigate the various systems of pilotage prevailing in different parts of the Dominion, with a view to adopting a uniform system, and that the commission will consist of one representative from the shipowners, one from the pilots, and a third, independent of either.

W. D. Reid, President, Reid Newfoundland Co., who was visiting Newfoundland early in February, is reported to have stated that it is likely that the company will order another vessel during the year, probably to take the place of the s.s. Invermore, between Port aux Basques and North Sydney. The Invermore will probably be transferred to the Labrador route.

The Reid Newfoundland Co.'s s.s. Bruce, recently built at Greenock, Scotland, arrived at St. John's, Nfld., Feb. 12, having taken seven days and 21 hours on the voyage. The average speed was 12 knots an hour. She is built of steel, and specially designed for service among ice. Her dimensions are—length 250 ft., breadth 36 ft., depth, 25¼ ft., 1,700 gross tons, and she is equipped with triple expansion engines having cylinders 25, 42 and 68 ins. diam. by 45 ins. stroke, supplied with steam from four boilers at a working pressure of 180 lbs., giving about 3,000 i.h.p. She has been placed on her route between Port aux Basques and North Sydney.

One of the most remarkable developments of shipping in connection with the use of oil fuel is reported from Liverpool Journal of Commerce. Contracts are stated to have been given recently for the building of 21 oil tank steamships of large dimensions which will be adapted for the consumption of either coal or oil. Several of these are for owners on this side of the Atlantic.

Province of Quebec Marine.

P. A. Jodoin, heretofore overseer of the Chambly canal, has been appointed Inspector of Stores, Quebec canals, and E. Robitaille has been appointed overseer of the Chambly canal.

The Minister of Marine, replying to questions in the House of Commons, stated that the total debenture debt of the Montreal Harbor Commission was \$16,707,000, of which \$1,872,000 was due to the public, and the balance to the Government. The interest payable to the Government was 3% on \$9,195,000, and 3½% on \$5,540,000. The interest due on Jan. 1 was \$218,430.99.

The Department of Marine is dredging a 15 ft. channel in the St. Lawrence River, north of the ship channel, leaving the deep channel near Lanoraie, leading up past Lavaltrie, St. Sulpice and Repentigny, and rejoining the ship channel above Ile Deslauriers. The buoys in this channel will bear the letter R, preceding a number, whereas the buoys in the ship channel will bear the letter M, preceding a number.

The Minister of Marine has given notice of a resolution in the House of Commons, providing for a further loan of \$6,000,000 to the Montreal Harbor Commissioners for the completion of the terminal facilities of the harbor according to the plans already approved by the Government, and to retire debentures amounting to \$600,000, maturing in equal portions in 1913, 1914 and 1915. The terms of the loan will be the same as previous loans, the interest being 3½%, and the loan repayable within 25 years.

A deputation consisting of A. A. Allan, President, and T. Robb, Manager of the Shipping Federation of Canada, J. Thom, Manager, International Mercantile Marine Co., Montreal, and G. T. Davie, of Levis, waited on the Minister of Marine, Feb. 8, to urge that the Levis dry dock and ship repair plant be taken over by the Government. It was stated that the plant is not prospering, but if it were taken over and enlarged it could be made into a very valuable repairing and salvage plant able to look after the largest vessels using the St. Lawrence route.

The Department of Marine received tenders to Feb. 26 for the supply of a steel single screw hopper barge, and one or two single screw bucket dredges for the St. Lawrence ship channel service. Following are the chief details—for the barge, length between perpendiculars, 180 ft., breadth moulded 32 ft., depth moulded 14½ ft., draught, mean to bottom of keel plate, 12 ft., deadweight on foregoing draught 785 tons, coal supply 90 tons, complement of officers and men 16, indicated horse power 500, net capacity of hopper, 530 cub. yds., to be built of steel throughout, classed 100A1, Lloyds' river service, under their special survey and Government inspection; for the dredge, length between perpendiculars 195 ft., breadth moulded 37½ ft., depth moulded 14 ft., normal draught in fresh water 9½ ft., deadweight on foregoing draught 150 tons, coal supply 130 tons, indicated horse power 800, dredging depth 52 ft., capacity of buckets 27 cub. ft., speed of buckets 10 to 12 and 18 to 20, to be built entirely of steel, to Lloyds' 100A1 dredger class, under their special survey and Government inspection.

Ontario and the Great Lakes.

Capt. T. J. Jones, who sailed on the St. Lawrence and Rideau Rivers, died in Ottawa, Feb. 20, aged 92.

The St. Clair and Erie Ship Canal Co. is applying to Parliament for an extension

of the time within which it may build the works authorized in the act of incorporation.

C. Noble, Manager, Dominion Transportation Co., Owen Sound, operated by the United States and Dominion Transportation Co., Chicago, Ill., died at Collingwood, Feb. 13.

A. Taylor is reported to have been appointed superintendent of the construction work on the breakwater and harbor improvements, which are being undertaken by the Public Works Department, at Port Stanley.

I. B. Folger, Kingston, is reported to have purchased the steamboat Robert McDonald, which went ashore at Chautmont Bay last year, and it is stated that he intends having her refitted for the lake and river service.

A bill was introduced into the U.S. Congress, Feb. 16, providing \$250,000 for a survey and estimate of cost of a ship canal to connect the navigable waters of the Niagara River, making a continuous water route between the five great lakes.

The Shenango Steamship Co.'s steamboat William P. Snyder, Jr., was launched at Detroit, Mich., Jan. 28. She is, with the same company's steamboat Schoenmaker, the largest vessel on the lakes. The dimensions are: length overall, 617 ft.; breadth, 64 ft.; depth, 33 ft., with a deadweight capacity of 14,200 short tons on a draught of 19½ ft.

The Minister of Public Works has given notice of a resolution in the House of Commons, providing for the ratification of an agreement for the building of another dry dock at Collingwood, and authorizing the payment of a subsidy for a dry dock of the second class of 3% each year for 20 years on \$306,965, the cost of construction.

The Port Colborne and St. Lawrence Navigation Co., Ltd., has been incorporated under the Dominion Companies Act, with a capital of \$100,000 and office at Toronto, to carry on the business of a navigation company, and for other purposes. The incorporators are:—Cawthra Mulock, E. H. Laschinger, W. D. Robertson, and C. W. Band, Toronto.

The Calvin Co. has purchased the steamboat Cornwall from the Richelieu and Ontario Navigation Co., and intends to fit her out completely for wrecking purposes. She was built at Kingston in 1874, and was formerly named Algerian. She is paddle wheel driven, equipped with engine of 88 n.h.p., and her dimensions are—length 175.3 ft., breadth 27.1 ft., depth 9.9 ft., tonnage 914 gross, 576 register.

An Ottawa press dispatch states that the Government has practically decided to commence work in the spring on the enlargement of the Welland canal in part, and the construction of a large new section for the remainder of the distance, the whole being 22 ft. deep. Surveys in connection with this work were made last summer, and it is stated that the plans are practically completed. The cost is estimated at \$30,000,000.

The Northern Navigation Co. has made the following appointments to its vessels for the forthcoming season:—

City of	Captain.	Chief engineer.
Midland	M. Livingstone	J. Osburn
Doric	S. Hill	
Germanic	F. Niles	S. Burgess
Hamonic	R. D. Foote	S. Brisbin
Huronie	A. L. Campbell	F. Norris
Ionic	J. D. Montgomery	J. Louden
Majestic	W. G. Cox	S. Beatty
Saronic	A. M. Wright	W. Whipp
Waubic	W. Carson	S. Murray

Recommendations for improvements to the harbor at Kingston, made to the Public Works Department, include the erection of a new bridge on the site of the present one, with a draw in the centre, 140 ft. wide, the inner and outer portions being made 300 ft. wide, made

into a causeway and use for wharfage, the dredging of the inner and outer harbors, and the building of a wharf on the Martello Tower shoal.

E. L. Cousins, Engineer of the Toronto Harbor Commission, commenced a hydrographic survey of the bay, Feb. 7. The work is being carried out by two parties, one on shore, and the other working on the ice. On the completion of this, a geographical survey will be made. J. G. Sing, M. Can. Soc. C.E., District Engineer, Dominion Public Works Department, Toronto, has been appointed Consulting Engineer to the Commission. The appointment will not interfere with his Government duties.

The U.S. Lake Survey reports the levels of the Great Lakes in feet above tide-water, for January, as follows:—Superior, 601.75; Michigan and Huron, 579.32; Erie, 571.30; Ontario, 244.76. As compared with the average January levels for the past 10 years, Superior was 0.38 ft. below; Michigan and Huron, 0.76 below; Erie, 0.37 ft. below, and Ontario, 0.63 ft. below. It was anticipated that Superior would fall 0.2 ft. during February, that Michigan and Huron would remain stationary, Erie fall 9.1 ft., and Ontario rise 0.1 ft.

The Department of Railways and Canals is reported to have awarded W. B. Russell, Toronto, the contractor for the construction of the Newmarket canal, which work has been abandoned by the Government, \$1,000 as compensation for the cancellation of the contract. In addition to this it is stated that he has been awarded the contract for the rebuilding of all the bridges over the canal and the repairing of the highways demolished in the course of the construction work. An engineer's report on the matter states that over 80% of the work has been completed, and that the amount required to complete it would be about \$200,000.

At a recent meeting of the Owen Sound council, the mayor announced that he had received a communication from the C.P.R. stating that the company would remove its vessels to the Port McNicoll route in the spring, and intimating that it might be possible to have one of its vessels call each week at Owen Sound on the up trip. It was also stated that the volume of grain traffic to Owen Sound would not justify the company in rebuilding the grain elevators recently destroyed by fire. A deputation was appointed to meet Vice President McNicoll, and discuss the matter fully, with a view to arranging a more frequent service.

At the recent annual meeting of the Mutual Steamship Co., Toronto, it was announced that the majority of the stock had been acquired by J. W. Norcross, Toronto, and R. M. Wolvin, Winnipeg. It is reported that the company has two vessels under construction for its service during the forthcoming season, but we are officially advised that the company is not in a position at present to state that it will make any additions to its fleet this year. Following are the officers and directors for the current year:—President, R. M. Wolvin; Vice President and Managing Director, J. W. Norcross; other directors, H. Munderloh, C. D. Secord and T. White.

Manitoba, Saskatchewan and Alberta.

The Hudson's Bay Co. is stated to have made arrangements for the construction of two steamboats at Athabasca Landing, Alta., one for operation on the Athabasca River, and the other on the lake. The former will be 150 ft. long, and will be equipped with the machinery from the company's steamboat Hazleton, which, until last season, was run on the Skeena River. The second boat will be 110 ft. long.

British Columbia and Pacific Coast Marine.

It is reported that plans are in preparation for the construction of a fisheries protection cruiser for B.C. waters to replace the Kestrel.

A small steamboat is under construction at Ladner, B.C., for Capt. Martinovich. The engines, boiler, searchlight and other equipment have been purchased in England.

The Canadian Puget Sound Lumber Co. has ordered a steel tank scow for transporting oil fuel at Esquimalt, and it is reported that three steamboats for the coasting trade have also been ordered there.

The Dominion Government steam tug, Point Grey, which has been built at North Vancouver, was expected to be ready for service towards the end of February. She is to act as tender to the dredge Mastodon.

At the recent annual meeting of the Victoria Shipmasters' Association, Capt. D. L. Jones was re-elected President, and H. Bilton, W. Heater and E. Parsons, were elected First and Second Vice Presidents, and Secretary, respectively.

The G.T.P. Coast Steamship Co.'s s.s. Prince George has been equipped with oil burners at Esquimalt, and is scheduled to take the place of the s.s. Prince Rupert, on the northern route, Mar. 3, when the latter vessel will be taken from service to be similarly equipped.

The Coastwise Steamship and Barge Co., Ltd., has been incorporated under the Dominion Companies Act, with \$250,000 capital and office at Vancouver, to own and operate vessels, and carry on a general water transportation business. The incorporators are, J. Griffiths, Seattle, Wash., W. R. Dockrill, T. Ludgate, G. F. Cameron and C. Stewart, Vancouver.

The contract for the construction of about 6,900 ft. of jetty, at the mouth of the Fraser River, for \$171,000, is reported to have been awarded by the Dominion Public Works Department, to T. F. Sinclair, New Westminster. Of the length of jetty named, 3,100 ft. will be single bulkhead, and the remainder, double bulkhead. It will commence from about 968 ft. from the Garry Point tide gauge, near Steveston.

Press reports state that the Dominion Public Works Department is about to place an order for another rock crusher, similar to the one recently built in Scotland, for use in B.C. waters. It is recommended that should such an order be placed, the system of anchoring should be similar to that adopted on the dredges Ajax and Mudlark, as the number of cables employed in anchoring the rock crusher prove a menace to shipping.

The C.P.R. s.s. Princess Patricia, formerly Queen Alexandra, which the C.P.R. recently purchased and has had re-modelled for its Vancouver-Nanaimo route is on her way to the coast by way of the Horn. Owing to her small bunker capacity a number of calls have to be made for coal. Among the places called at are Cardiff, Las Palmas, St. Vincent, Bahia, Monte Video, Punta Arenas, Coronel, Callao and San Francisco.

It is reported that the master mariners of British Columbia are forming a guild, with objects similar to those of the Imperial Merchant Service Guild. It is proposed to include all certificated masters serving in British Columbia waters, and to adopt a policy which will not be antagonistic to shipowners, but which will be calculated to aid master mariners in matters affecting the efficiency and responsibility of their pro-

fession, and to provide legal assistance at marine enquiries.

The Minister of Public Works is considering the plans for a series of proposed improvements in the harbor at Victoria. In the inner harbor the whole area is to be deepened and a number of obstructions removed, and the improvements in the outer harbor comprise the construction of two breakwaters, piers and warehouses with railway accommodation. The Government included \$500,000 in the recent estimates for the proposed outer harbor improvements. The proposed dry dock at Esquimalt, to be built by the B.C. Marine Railways Co., will also add considerably to the harbor facilities. The dock will be 1,000 ft. long, 1,000 ft. wide and 34 ft. wide.

At the recent annual meeting of the Shipmasters' Association at Victoria it was decided to ask all shipmasters in British Columbia to forward to the association a list of aids to navigation which, in their opinion, were necessary for the safety of passengers and for facilitating the navigation of freight vessels. The information thus obtained will be tabulated and forwarded to the Marine Department with a recommendation. Following are the chief officers of the association for the current year:—President, L. Rogers; Treasurer, John Newcombe; Secretary, J. R. Stewart.

Telegraph and Cable Matters.

Wireless telegraph messages were exchanged between Canada and Spain, via Poldhu, Cornwall, Eng., Jan. 29.

The Marconi Wireless Telegraph Co., London, Eng., paid a dividend Feb. 1 for six months ended Dec. 31, 1911, on the 7% cumulative participating preference shares.

E. W. Humphrey, President, Northern Commercial Co., Montreal, and at one time connected with the Dominion De-Forrest Wireless Telegraph Co., died at Brooklyn, N.Y., recently, aged 51.

The G.N.W. Telegraph Co. is making arrangements to install eight new motor generators in its Ottawa office, replacing a storage battery plant, which has been in use there for some years.

The Mackay Companies' report for 1911 shows a surplus of \$950,338. R. A. Smith, Toronto, and H. C. Meredith, Montreal, were re-elected among the trustees for the current year.

The G.N.W. Telegraph Co. reports that the public is making free use of the reduced rate cable services, and evidently appreciates the reductions through the cable letters, week-end letters and deferred rate messages.

J. W. Baker, lately Manager of the G.N.W. Telegraph Co.'s branch office in the cheese district, Montreal, has been appointed an inspector of the company, covering the eastern portion of the province of Ontario and western portion of the province of Quebec. He was at one time manager for the company at Brockville.

A joint meeting of the eastern and western divisions of the Association of Railway Telegraph Superintendents will be held in Chicago, Ill., Mar. 20. A special meeting of the entertainment committee was held in New York, Feb. 16, when plans were outlined for the entertainment of the members at the annual convention in New York, June 24.

At a meeting of the Canadian Society of Civil Engineers Ottawa branch recently, C. P. Edwards, General Superintendent of the Government Radio Telegraphs, and formerly an assistant on Marconi's technical staff, read a paper on the development of wireless telegraphy, illustrated with diagrams and lantern slides. He attempted to show in

as simple a way as possible the general development of the art of wireless telegraphy and the principles on which it depends.

The C.P.R. Telegraph Department will this year erect additional copper wire between Canso, N.S. and Montreal, Montreal and Winnipeg, Winnipeg and Moose Jaw, Sask., Saskatoon, Sask. and Calgary, Alta., via Edmonton, besides several shorter circuits, making a total of about 6,000 miles of new wire. Considerable reconstruction will also take place on various parts of the line in order to keep the system up to standard. Additional telegraph lines will also be erected along the new railway branches to be built during the forthcoming season.

Trade and Supply Notes.

The matter which appears under this heading is compiled, in most cases, from information supplied by the manufacturers of, or dealers in, the articles referred to, and in publishing the same we accept no responsibility. At the same time we wish our readers to distinctly understand that we are not paid for the publication of any of this matter, and that we will not consider any proposition to insert reading matter in our columns for pay or its equivalent. Advertising contracts will not be taken with any condition that accepting them will oblige us to publish reading notices. In other words, our reading columns are not for sale, either to advertisers or others.

American Vanadium Facts, issued monthly by the American Vanadium Co., Pittsburgh, Pa., has tooled steel as the principal subject in its February issue.

The H. W. Johns-Manville Co. has acquired the sole selling agency for the entire products of I. P. Frink, including the Frink reflectors and fixtures.

The Safety Car Heating and Lighting Co.'s monthly pamphlet contains an illustrated article on the indirect lighting method of illuminating passenger cars.

The Baldwin Locomotive Works, Philadelphia, Pa., has acquired the right to build the Garrett type locomotives for service in Canada and the United States. The special feature of these locomotives is that they are of high capacity and will operate on lines having sharp curves.

Lyford, Clark and Lyford, forest engineers, Montreal and Vancouver, have issued a booklet, "Forest Surveys, what they are, wherein they serve, what they cost," which contains considerable interesting and valuable information, and will be found useful to anyone interested in timber properties.

Emilius Jarvis & Co. have issued the following statement respecting the Canadian Locomotive Co.: "For the first six months ended Dec. 31, 1911, the books show that notwithstanding the unprofitable contract which has formed the bone of contention between Mr. Hartly and ourselves and has occupied the plant for the greater part of that time, profits in completed locomotive contracts, interest on the company's investment (amounting to about \$17,000 for the period) and miscellaneous earnings total at least \$85,000 for the six months; and by June 30 next, the end of the company's fiscal year, with the business at present in hand at profitable prices, the General Manager informs us there is no doubt whatever that the company will have more than earned its full bond interest and preferred stock dividend. In addition, the company will have on hand available as further profits, \$105,000, which we and our associates paid it to make good the estimated profits upon the unprofitable contract referred to, the absence of profit upon which we did not know of at the time the old company was taken over and the new securities issued by us. Orders on hand are sufficient to keep the company's plant operating for the entire year 1912, and with additional contracts in sight, considerably beyond that time."

NOTICE TO CONTRACTORS.

The Temiskaming and Northern Ontario
Railway Commission.

Toronto, February 24th, 1912.

SEALED TENDERS for the works (other than steel bridges) necessary to the complete construction of the road-bed ready for the ties and rails upon that section of the TEMISKAMING AND NORTHERN ONTARIO RAILWAY COMMISSION'S Railway extending from EARLTON to ELK LAKE, will be received at the office of the Secretary of the Commission, 25 Toronto Street, Toronto, until twelve o'clock (noon), on the twentieth day of March, 1912.

On receipt of a request in writing, a copy of each of the following documents:

Instructions to Bidders.

Form of Tender,

Specifications,

Form of Contract,

will be furnished to intending bidders at the office of the Secretary of the Commission, Toronto; or at the office of the Chief Engineer of the Commission, North Bay, where plans and profiles pertaining to the work may also be seen.

The right is reserved to reject any or all bids.

A. J. McGEE,

Secretary, Temiskaming and Northern
Ontario Railway Commission.

NOTICE is hereby given that the Annual Meeting of the Shareholders of the Victoria Rolling Stock and Realty Company of Ontario, Limited, will be held at the offices of Messrs. Osler and Hammond, 21 Jordan Street, Toronto, on Wednesday, March 6, 1912, at twelve o'clock noon, for the reception of the Annual Report and election of Directors for the ensuing year.

By order,

G. T. CHISHOLM,

Secretary.

Toronto, February 12, 1912.

FOR SALE

Barge "Santiago"

Three masted wooden barge in first class condition. Length, 325 ft.; beam, 45½ ft.; depth, 21½ ft.; gross tonnage, 2,600; net tonnage, 2,525; carrying capacity 5,000 net tons on 18 foot draft. Can be inspected at Yacht Club Lagoon, Toledo, Ohio, and full particulars as to price, etc., can be obtained by addressing C. B. Duffy, Pur. Agt., H.V. Ry., Columbus, Ohio.

CALL SWITCHES

We respectfully solicit trial orders for the
CALL RAILWAY SWITCHES. Choice
of four types, any section or weight.

Full Automatic Switch for main-line service only. This type of switch can be operated by the Engineer when entering siding, and by weight of train when leaving siding. Always set to main-line.

Semi-Automatic Switch — Best for wye service, or when automatic operation is desired from double to single track only.

Yard or Trailing Switch for yard

service. This type of switch is unexcelled. It is always automatic when trailing, and saves much time in switching cars.

Hand or Manual Switch—A very strong, durable type and equal to the best.

Several railroads in the United States are now using the **Call Switches**, and they are giving perfect satisfaction.

HAS THE COLD SNAP UPSET YOUR SCHEDULE ?

PACIFIC TYPE PASSENGER LOCOMOTIVE, EQUIPPED WITH SUPERHEATER, BUILT FOR CANADIAN PACIFIC RAILWAY.

Total Weight of Engine, 221,500 Pounds; Weight on Drivers, 141,200 Pounds; Diameter of Drivers, 75 Inches; Boiler Pressure, 200 Pounds; Cylinders, 21x28 Inches; Maximum Tractive Power, 28,000 Pounds.

With present improved methods of locomotive design 25 per cent. saving in fuel may be counted upon as compared with locomotives of conventional design. This means 33 per cent. more hauling capacity for the same amount of coal as before. Consider the significance of this in winter weather.

Anything which will increase the power output of a pound of coal is worth more in the winter than at any other time of the year. It is more difficult to make schedules because trains are harder to pull. In a winter storm it is most important that the utmost pulling capacity should be had from every shovelful of coal. The value of a margin of power is then most apparent. Here is where features making for economy mean the most, because economy in fuel means more power from the fuel fired. To save coal is important, but to economize in coal to make the coal do more work is more important.

One of the greatest advantages to be gained from recent progress in locomotive design is the ability to cope with winter conditions and discount the difference which cold weather makes in operation.

Why Not Call A Spade A Spade?

Cuts show One Piece Feature of All Wire Bonds Patented in U.S.A.

Joints made by attaching terminals of a bond to the body are *joints*. In ALL WIRE RAIL BONDS the terminals are formed out of the body of the bond itself—hence our One Piece Feature—result, **NO JOINTS**.

Four "joints" per bond (of other makes) mean 1408 unnecessary joints per mile of track.

You would not use a feeder cable that had splices every few feet, no matter how perfect the joints were—why not select *One Piece* Rail Bonds also? Let us tell you the *whole* story.

THE OHIO BRASS CO., Mansfield, Ohio, U.S.A.

EDISON BSCO

PRIMARY BATTERY

**for railway service—
the first assembled-
in-one copper oxide
battery made.**

Every railway signal engineer and purchasing agent should have the complete information we have gathered regarding the service of Edison BSCO Primary Batteries in use on many of the great railroads throughout the country. This information will tell you that the Edison is easily the most reliable, as well as by far the most economical.

The operation of making renewals is much more simple and more rapidly effected than in other batteries—and renewals cost less, considering service obtained.

Reliability is the first thing for you to consider in your battery service—and economy, the second. The Edison BSCO is the railway signal battery in which you are certain of both.

DAKE ENGINE CO., Grand Haven, Mich.

NORTH AMERICAN LIFE

REPORT FOR 1911

The Thirty-first Annual Meeting of the Company was held at its Home Office in Toronto, on Thursday, Jan. 25th, 1912, when the report of the business of the year ended Dec. 31st, 1911, was presented.

CASH INCOME

The Cash Income during the year from premiums, interest, etc., was \$2,295,176.98, showing a large increase over the previous year.

PAYMENTS TO POLICYHOLDERS

The amount paid on Policy-holders' Account was \$388,313.49, of which sum \$148,135.09 was for surplus or dividends. The relative importance of the policy-holders' interests is at once apparent, considering that the sum of \$6,000 only was paid to Guarantors. Holders of Deferred Dividend Policies received \$501,399.96. This item, including Reserve and Surplus, shows an increasing amount from year to year. It is an incident of the Company's growth and progress, and affords ample evidence that the business is being conducted for the benefit of the policy-holders.

ASSETS

The Assets increased in 1911 by \$924,334.25, and now amount to \$12,313,107.57. The Bonds and Stocks owned by the Company are carried, as heretofore, at their cost price, although the market value was \$168,575.72 in excess thereof, for which credit has not been taken.

NET SURPLUS

After making provision for all liabilities and further strengthening the reserves, the Net Surplus was increased to \$1,300,784.00. This shows a handsome increase over the surplus of last year, and at once establishes the unexcelled financial condition of the Company.

INSURANCES INCREASED

The policies issued during the year, together with those revived, amounted to the sum of \$6,129,426, being an increase of \$1,019,367 over that of the previous year. The total business in force amounts to \$45,849,515.

L. GOLDMAN,
Managing Director.

J. L. BLAIKIE,
President.

Car Wheel Economy that Means Something

Pay 10c more per 100 lbs. of wheel and save \$200 on every \$1,000 you invest in chilled wheels. In other words, buy wheels made of iron purified by Titanium Alloy. They give at least 20 per cent. more mileage than ordinary chilled wheels.

TITANIUM

The Wonder-Working Alloy

is added in the cupola. It closes the grain of the metal; makes it denser, tougher and less brittle. Titanium Alloy is used and endorsed by the best known wheel manufacturers and railways in the country.

Booklet No. 30 will prove profitable reading. Send for it.

Titanium Alloy is made for Canadian Consumption by Electro Metals, Ltd., Welland, Ont.

BOOTH WATER SOFTENERS

NO CLIMBING-

All Working Parts
at Ground Level

What You Should Know

- (1) Boiler Maintenance—
One \$10,000 softener
saved \$250 per month—
30 per cent. on investment.
- (2) Saving in Fuel—
One \$1,500 softener
saved \$4,888 yearly in
coal—over 300 per cent.
on investment. Another
softener reduced fuel con-
sumption 20 per cent.
- (3) Washing Out Boilers—
Stationary boilers washed
out once in 168 days; be-
fore using softener, once
in 7 days.
- (4) Cost of Purifying Water
The average cost is from
one to three cents per
1,000 gallons, depending
on hardness of water.

We have data on softeners in
operation to prove these and
other conclusive statements.

no other reference

work in the world that so completely meets the needs of the railroad man as the INTERNATIONAL RAILROAD LIBRARY. This is an epitome of the years of experience of the best railroad experts in the country edited in a style that 18 years of experience in publishing home-study textbooks has proved the easiest to learn, to remember, and to apply. The volumes of this library are a part of a series of textbooks that cost \$1,500,000 to prepare. They are recommended by the highest authorities and are used in nearly all our leading universities and colleges. Not only can they be used to great advantage by superintendents, railroad officials, foremen, engineers, firemen, conductors, and brakemen as an authoritative guide in their work, but since they can be so clearly understood even by persons having no knowledge of higher mathematics, they can be used by all classes of railroad employes that are desirous of advancing to higher positions. **MALLEABLE IRON AND STEEL CASTINGS
FOR RAILROAD USE**

SAVE TIME AND MONEY ON LOCOMOTIVE REPAIRS

Use Thermit and weld broken frames and mud rings without removing them from the engine. Locomotives can be repaired and returned to service in less than 24 hours.

The Thermit Process is in general use by the principal railways of the United States, Canada and Mexico, and there is nothing experimental about it.

Write for illustrated Pamphlet No. 22-N, which gives full particulars.

Goldschmidt Thermit Co.

Bonds Guaranteeing the Completion of Contracts

The London Guarantee and Accident Co., Ltd., issue bonds to responsible contractors, guaranteeing the fulfilment of their contracts. The attention of Municipalities, Corporations, and Industrial Firms is especially called to the advantages of such bonds, the necessity for which is now fully recognized. Before placing contracts therefore, owners should insist on bonds being furnished for the due performance of same, in the time and manner called for.

PROFESSIONAL CARDS.

THE RAILWAY AND MARINE WORLD is especially adapted for the publication of professional cards of engineers, inspectors, analysts, electrical experts, naval, grain elevator and other architects, solicitors, etc., who desire to bring themselves under the notice of the management and officials of the various steam and electric railway, steamship, grain elevator, telegraph, telephone and power companies throughout Canada, as well as the locomotive, car and ship-builders, contractors and promoters of railway enterprises. THE RAILWAY AND MARINE WORLD is the only medium through which all these important classes can be reached.

Rates will be quoted on application.

"BROWNHOIST" LOCOMOTIVE CRANES

"Brownhoist" Crane Coaling Engine on N. Y., N. H. & H. R. R. from cars on side track.

A RAPID AND ECONOMICAL METHOD of handling coal from car to engine or from car to coal tipple. The crane coals the engine while it is being cleaned on the ashpit. It cleans the pit, placing the ashes into the car. Many roads use the crane to fill the pockets on their coal chutes. Time and money are saved on both of these methods of coaling an engine.

ON CONSTRUCTION WORK the crane is a labor saver. The crane excavates, drives piling with a pile-driver, handles construction material of all kinds, switches the cars, places heavy steel structures, and does all the lifting and moving of material.

AROUND THE SHOP AND YARD the crane handles ALL material. It can be equipped with either grab bucket, bottom block, or lifting magnet. Either one is easily and quickly applied.

"Brownhoist" Cranes are built for hard and continuous service.

Catalogs and Full Information sent on request.

HAS THE COLD SNAP UPSET YOUR SCHEDULE ?

PACIFIC TYPE PASSENGER LOCOMOTIVE, EQUIPPED WITH SUPERHEATER, BUILT FOR CANADIAN PACIFIC RAILWAY.

Total Weight of Engine, 221,500 Pounds; Weight on Drivers, 141,200 Pounds; Diameter of Drivers, 75 Inches; Boiler Pressure, 200 Pounds; Cylinders, 21x28 Inches; Maximum Tractive Power, 28,000 Pounds.

With present improved methods of locomotive design 25 per cent. saving in fuel may be counted upon as compared with locomotives of conventional design. This means 33 per cent. more hauling capacity for the same amount of coal as before. Consider the significance of this in winter weather.

Anything which will increase the power output of a pound of coal is worth more in the winter than at any other time of the year. It is more difficult to make schedules because trains are harder to pull. In a winter storm it is most important that the utmost pulling capacity should be had from every shovelful of coal. The value of a margin of power is then most apparent. Here is where features making for economy mean the most, because economy in fuel means more power from the fuel fired. To save coal is important, but to economize in coal to make the coal do more work is more important.

One of the greatest advantages to be gained from recent progress in locomotive design is the ability to cope with winter conditions and discount the difference which cold weather makes in operation.

MONTREAL LOCOMOTIVE WORKS, LTD.

OTTAWA BANK BUILDING, MONTREAL, CANADA

The Statement Of A Railroad Storekeeper

Here is a report made by Mr. J. P. Murphy, General Storekeeper for the L.S. & M.S.R.R.:—

"In the handling of oils the Bowser System is being used extensively, and with it, at every engine house where it has been installed, we have been able to DECREASE our forces TWO MEN, one night and one day, as it has been entirely possible to have the supply man deliver the oils in addition to his other duties. The pumps are located so the oils and supplies are delivered over the same counter."

The above is copied verbatim from his report to the convention. This shows the economy of the Bowser System under actual working conditions.

Why can't you save the labor of two men and maintain absolute accuracy in your oil department?

Marine Oil Storage

There is no place where more scrupulous care should be used than on steam ships, etc., not alone for the sake of cleanliness and economy, but a dirty engine-room is always a constant fire hazard.

Battery of Cut 64'S

The Bowser System has been especially designed for marine use. When desired the pumps are trimmed in polished brass to harmonize with the fittings in the engine-room.

Why not get our literature on this matter and see just how much improvement can be made in handling your oil? Ask for catalogue No. 18.

S. F. Bowser & Co., Inc., Toronto, Ont. 66-68 Frazer Avenue

For twenty-seven years manufacturers of self-measuring oil pumps and tanks, gasoline and oil storage systems, self-registering pipe line measures, oil filtration and circulating systems, etc.

FAIRBANKS - MORSE

Combined Gasoline Engine and Pump

Our Water Station Equipment will reduce your expenses, such as attendance, maintenance and fuel cost to a minimum. A great advantage in this system, whether for railroads water station or for town waterworks, is the little attendance necessary. A section foreman or a station agent can look over the engine and start it before taking up his other duties.

We contract for complete erection of these tanks and the furnishing of pumping machinery.

The Simmen System of Railway Signalling and Train Despatching

This System Combines all the
features of
Telephone Train Despatching
with
"REMOTE CONTROL"
BLOCK SIGNALS

A Permanent Record
in the Despatcher's
office is automatically
and continuously made
and shows the exact
position of trains at
all times.

Despatcher's Table

All Signals from Despatcher are made Direct to Train Crew
(without any intermediary.)

Switches on Despatcher's Table are INTERLOCKED and
clear opposing signals are rendered absolutely impossible.

Track Capacity is increased and double tracking
may be delayed correspondingly.

Passing sidings, being all in electric communication with
Despatcher, become equivalent to telegraph stations with
day and night operators.

Why the C. P. R. North Toronto Route to Ottawa and Montreal is the Logical One

The train leaves as follows:

Leave North Parkdale	- - -	9.15 p.m.	Arrive Ottawa, 6.50 a.m.
Leave West Toronto	- - -	9.30 p.m.	Arrive Montreal, 7.00 a.m.
Arrive North Toronto	- - -	9.40 p.m.	Daily.
Leave North Toronto	- - -	10.00 p.m.	Will Stop at Westmount.

Electric Lighted Compartment Cars and Standard Sleepers for both points.

- ¶ The North Toronto route is over an hour faster and overcomes a long hill climb for the train out of Toronto, obviating any inconvenience and ensuring early arrival at Montreal and Ottawa.
- ¶ The roadbed has been improved till it is unexcelled in Canada.
- ¶ The equipment is "Canadian Pacific Standard," a synonym for the "best" and attentive porters, ensure efficient service.

Nicholson Co.

The Only Satisfactory Test of a File is Actual Use

Mechanics are particular and will continue to use a make of file they have found to give the best results. The Nicholson File Company adopted and adhered to the policy of making the best file possible.

The result of this policy is that their business has increased from 100 dozen a day sold in a local market in 1864 to 16,000 dozen a day sold all over the world, and Nicholson-made Files are recognized as the standard wherever files are used.

Our Improved Reinforced BRAKESHOES

RAILWAY BRAKESHOE

Are suitable for all classes of Electric and Steam Railways and Street Cars. They are fitted with an improved attaching lug which can be made of any desired thickness to suit the class of service, and requires no reinforcing for retaining it in position and cannot be detached from the Steel Back.

They have an even co-efficient of friction throughout their whole life and a greater percentage of this shoe can be worn out than any other make of shoe on the market.

We stock all standard Brakeshoes suitable for Christy heads, etc.

We contract on a guaranteed saving on your present aggregate cost.

Let us submit you further particulars.

Patents applied for in all countries.

Canadian Brakeshoe Company, Ltd.

Grand Trunk Railway Oil Burning Motor Car.

By Frederick H. Moody, B.A.Sc.

For a great many years the G.T.R. has had a small motor car operating on the International Bridge over the Niagara River, between Bridgeburg, Ont., and Black Rock, N.Y. This car is of very small proportions, about the same as a small sized electric street car, only with steam motive power, a small coal fired boiler occupying one end. About three years ago, a larger car was built for the same service, having the same general size as that of a standard passenger car, similar in construction to the oil-burning motor car in fig. 1, which is under discussion in this article. This second car, coal-burning like its predecessor, proved such a success in this service across the bridge, that it led to the consideration of the advisability of extending the service from Black Rock to Port Colborne, Ont. The coal-burning car is now mak-

Truck One, 4-wheel, 34-in. steel tired wheels
Truck, wheel base 8 ft.
Truck journals $4\frac{1}{2}$ x 8 ins.
Doors, passenger end 6 ft. 6 ins. x 2 ft. 2 ins.
Doors, motor end 6 ft. 8 ins. x 1 ft. 9 ins.
Wheel base 52 ft.

The car is divided into three compartments. The passenger compartment is 31½ ft. long, smoking, 11 ft. 7 ins., and engine room, 16 ft. All compartments are 8¾ ft. wide. The seating capacity in the passenger end is provided for by 26 double seats, and two settees, seating 6 passenger each. All these seats have medium height backs, and are upholstered in imitation leather. The accommodation in the body of the car is 42, with 16 in the smoking compartment, a total capacity of 58. Both passenger apartments are finished in mahogany, varnished and polished.

Firebox 36 3-16 ins. long x 38¾ ins. wide
Tubes 144 1½ in., 5 ft. 6½ ins. long
Heating surface, tubes 308.4 sq. ft.
Heating surface, firebox 51.6 sq. ft.
Heating surface, total 360 sq. ft.
Grate area 9.6 sq. ft.
Water tank capacity 1,620 U.S. gals.
Oil tank capacity 313 U.S. gals.

The boiler is of the usual locomotive type, considerably shortened. It is provided with sand box and steam dome, as is customary, and the safety valve, instead of being an independent dome, is attached to the top of the steam dome, a large diameter vent leading from the latter outside the roof of the car. The sand box has four leads, one for both front and rear of each driving wheel, for the car is intended to operate in either direction equally well. The smoke stack, located immediately in front of the sand box, has an outer lag-

Fig. 1. Grand Trunk Railway Oil Burning Motor Car.

ing 24 round trips a day between the two border towns, accommodating people whose business calls them back and forth to Buffalo, Black Rock being a suburb of that city.

The north shore of Lake Erie, as far west as Port Colborne, is one of Buffalo's favorite nearby and summer resorts, and the summer traffic along that portion of the Black Rock to Goderich branch of the G.T.R. Middle Division is fairly heavy. This traffic, being suburban in its nature, in order to be developed properly, required a more frequent service than would be profitable were complete train units to be operated to meet this demand. This led to a further development of the coal-burning car used so successfully to cross the bridge.

An oil-burning car was built at the company's Point St. Charles shops, Montreal, of the same general size, but with the elimination of the use of coal, which made the services of a fireman unnecessary. This motor car is shown in fig. 1, the other illustrations showing the motive power details. Following are the principal dimensions of the car:—
Length over end sills 60 ft.
Length over drawbars 71 ft.
Width of body 10 ft. 1 in.
Width of upper deck 6 ft. 2 ins.
Width over lower tail lamps 11 ft. 3 ins.
Height from rail to top of roof, over all 14 ft. 8½ ins.

Four acme oil lamps furnish the car lighting; the heating is by straight steam. The windows are of the plain double type, with combination art glass tops, 17 to a side, with two on the end. The blinds are pantasote roller type, with clip fixtures. The deck sashes correspond in number to the side windows. The floor covering consists of a centre strip of linoleum.

The outside painting is of the usual G.T.R. standard dark green color with broad stripe ornamental trimmings. The roof is covered in modern canvas style.

The locomotive end and its general arrangement with regard to the car body are shown in fig. 2, the car body at that end being roughly outlined about it, as indicated. Following are the principal dimensions:—

Gauge 4 ft. 8½ ins.
Service Suburban
Fuel Crude oil
Tractive power 4,876 lbs.
Weight of car, motor end 64,400 lbs.
Weight of car, total 101,100 lbs.
Wheel base, engine 6 ft. 2 ins.
Cylinders 11 x 16 ins.
Valves Slide
Driving wheels, diam. 54 ins.
Radial truck wheels, diam. 33 ins.
Driving wheel journals 7 x 8¾ ins.
Radial truck journals 6 x 7¾ ins.
Boiler Radially stayed
Boiler, diam. 3 ft. 6 ins.
Pressure 160 lbs.

ging pipe to protect the roof of the car from excessive heat. Both stack and safety valve vent project a short distance above the top of the car, as the illustration shows.

The motive power unit comprises a complete single driver locomotive, with a radial trailing truck, the frame and spring rigging, etc., being practically the same as in a locomotive of the usual construction. The car sills are attached front and rear to this frame.

A throttle lever on top of the boiler, on the engineer's side, connects with the throttle in the steam dome. The steam, on its path to the cylinders, passes along a 3-in. dry-pipe located in the boiler body over the firebox, coming out through the back head and passing down around the firedoor opening to a tee head, where it branches out each side to the cylinders attached to the outside of the frames. The exhaust from each cylinder passes into a 2½-in. looped pipe leading halfway along under the boiler, connecting there through a tee head having sweeping curves to a 3½-in. pipe leading forward between the frames and up into the smokebox. An exhaust pipe of good design provides ample draft.

The cylinders, located under the platform at the rear end of the boiler, are different from the usual locomotive type

used in America, though somewhat similar to the outside attached cylinders on the slab frame common in Great Britain. They are bolted to the outside of the frame, there being no saddle casting of which they can form a part. The valve chests, containing slide valves, are

as shown in the illustrations, figs. 1 and 2. The piping for oil, which is the principal feature of design in this car, is shown in fig. 3. A $\frac{3}{4}$ -in. steam pipe leading along the top of the boiler from the steam dome leads to three reducers and $\frac{3}{8}$ -in. valves. The valve to the left

five pipe connections being at the rear end of these chambers. The steam chamber has an adjustable opening at its front end through the two pieces of copper, the lower one of which is adjustable by means of cap screws in elongated slots. The 1-in. opening can

Fig. 2. Motive Power Equipment of Oil Burning Motor Car.

well set into the frames, the valve stem being directly over the wheel tread. The motion work is of the Stephenson type.

The radial truck is of simple design, suspending links allowing for a slight side movement of the truck, to allow the otherwise rigid wheel-base to negotiate curves. The locomotive end, while essentially a truck like the passenger end, is

leads to the air pump. The middle valve controls the oil heating coils in the rear oil tank of the two located on the side opposite to the engineer. This coil consists of four turns of $\frac{1}{2}$ -in. pipe bent to a 6-in. circle. The steam passing through this coil escapes under the car through a downward pipe from the top of the coil leading through the floor of the

be varied from a hair breadth to over $\frac{1}{2}$ -in., giving a wide latitude of variation to the volume of the steam jet. The oil comes into the upper chamber, and dribbling down over the front edge of the chamber, is there picked up by the steam jet, atomized by it, and sprayed into the firebox, the atomized spray of oil burning with great intensity.

The injecting steam comes from the right of the three valves in the pipe leading from the steam dome, before mentioned. The oil travels down by gravity from the tank containing the oil-heating coils. These coils prevent the oil from congealing, and cause the flow of oil to be steady. The first section of pipe leading from the oil tank is $\frac{1}{4}$ in., and has a stop cock in it. The section next the oil injector is 1 in., and contains the engineer's control valve or feed cock, the oil control wheel for which is located near the throttle lever conveniently for the engineer. The controlling wheel and the oil valve are connected through rods with intermediate bevel gears.

The oil injector, located directly under the mud ring at the front of the boiler, impinges the hot flames under a brick arch in the firebox. The furnace is provided with a brick lining part way up, along the sides and front, the latter bending up over to form a deflecting arch. This protects the boiler tube sheet from the intense heat of the oil flame, the heat of combustion being at the same time conserved, passing up over the arch into the tubes. The face pieces of the oil injectors are made of copper to withstand this intense heat, which might otherwise melt the face of a metal that is not as good a conductor of heat as copper.

The usual firedoor opening is bricked up, leaving only a small opening in the centre for cleaning purposes. The use of oil fuel in a boiler causes the tubes to become coated with a hard, oily carboniferous matter that if allowed

Fig. 3. Oil Piping on the Boiler, showing Location of Oil Injector.

not mounted on a bogie truck, free to adjust itself to curves; hence the radial truck is required for the leading wheels.

The spring system is so designed as to cause the major portion of the weight to fall on the drivers. The lower lever is fulcrumed on its spring off centre. The water tank is located directly forward of the drivers, under the centre of the car,

car. Another drain is provided in the pipe running to the coil itself, and is controlled by another valve in the location shown.

Oil is injected into the firebox by steam pressure, the nozzle used being shown in fig. 4. This nozzle consists of a two-chambered casting, the upper for oil and the lower for steam, the respec-

to accumulate would eventually clog up the tubes to the passage of the gases. This would reduce the conductivity of the tube in the same manner that the boiler scale reduces the boiler efficiency. This difficulty of clogged pipes has been overcome in the same way as that employed in marine practice. Through the small opening in the brick-ed-up door, a small shovel filled with sand is introduced. The draft is strong enough to pick up the particles of sand and draw them through the tubes, the sharp edges of the sand cutting away the caked carbon, thoroughly cleaning the insides of all the tubes. This cleaning is done about twice a day, and is being found sufficient to keep the tubes in good shape.

The combustion of oil is always regulated in oil-burning plants by the color of the gases escaping up the stack. This being difficult of accomplishment under ordinary conditions in a car of this type, without going outside the car to make observations, an ingenious provision has been made so that no difficulty will be experienced in making this inspection of the escaping gases. A small window, which may be observed beside the stack in fig. 1, in combination with a couple of mirrors conveniently located inside the engine room, makes an observation of the escaping gases at all times possible to the engineer.

This car, together with the other two cars previously mentioned, are housed in

of the objectionable features of coal-burning are done away with.

The writer is indebted to the G.T.R. Motive Power Department for the details of construction and the features of operation.

Lubrication of Superheated Steam Locomotives.

At the annual meeting of the Traveling Engineers' Association in Chicago recently, the committee on "Lubrication of Locomotives using Superheated Steam," of which M. H. Haig was Chairman, presented a report containing the results of observations on 14 of the 30 roads having locomotives equipped with superheaters, which is abstracted as follows:—

The effect of superheat on lubrication, depends upon the temperature of the superheated steam. Smoke-box superheaters give the lowest degree of superheat, none of those reported exceeding 490 degrees F.; this was obtained with a drum type in service on the Santa Fe. The Baldwin superheater has a temperature of 420 degrees F. for the highest. At the temperatures obtained with smoke-box superheaters, little trouble has been experienced from the use of the same methods of lubrication employed on saturated steam locomotives, and

The only effect discernable, both with saturated and superheated steam, was that the quantity of oil consumed was increased. Some railways feed directly to the cylinder, while others feed in the usual manner to the steam chest. Satisfactory results are obtained by the following methods of feeding oil to the steam chest, all cases applying to piston valves, as no cases were known of superheated steam being applied with slide valves:

(a) Two feeds per steam chest, with a delivery near each admission port, preferably a little toward the centre of the steam chest;

(b) The customary one feed per steam chest, introducing the oil into the centre of the steam chamber;

(c) One feed per steam chest, introducing oil into the steam channel at a point near the steam chest; and

(d) Three feeds per steam chest, one in centre of steam chamber, and one at each end near the admission ports, each port of delivery having an individual lubrication feed.

To insure proper lubrication at all times, it is recommended by some that steam be admitted to the cylinders when drifting; it has been found that even though proper lubrication is obtained while working steam, the valves and cylinder walls become dry after drifting for some time. A drifting valve will let sufficient steam into the valve chambers and cylinder if properly handled by the engineer. These results were obtained from direct observation of two roads equipped with and without means of admitting steam while drifting. By proper care on the part of the engineer in always opening the drifting valve before closing the throttle, it is possible to obtain material increase in the life of packing rings.

The use of mechanical feed lubricators is reported on as being unsatisfactory, the hydrostatic type proving superior. The mechanical lubricators failed from mechanical defects, greater liability of failure, and higher cost of maintenance.

Several different grades of valve oil are used on locomotives equipped with high degree superheaters. Flash points of from 550 to 600 degrees F. were reported, in most cases the same oil as that provided for saturated steam locomotives. The oil as used by the Canadian Pacific Ry. has a flash point of 600 degrees F. for use with steam having a minimum temperature of 590 degrees F. The successful use of an arrangement of oil piping, whereby valve oil is passed through the smoke box before entering the steam chest, indicates that high temperature has no permanent effect upon its lubricating qualities when protected by steam. This should not be considered as proof, however, that oil possesses any lubricating qualities while subjected to excessive temperature, as the temperature in the steam chests and cylinders is comparatively low.

High superheat has increased the quantity of oil used in valves and cylinders, varying in different cases from 10 to 100%. The larger percentages are due to the delivery of oil directly to the cylinders without a reduction in the quantity fed to the steam chest. One road, however, reports that the reduction of water carried to the cylinders by foaming, which has been effected by the application of superheat, has enabled the locomotive to be operated with no increase in the oil allowance.

The wear of cylinder packing rings is increased by the use of highly superheated steam, and the direct introduction of oil into the cylinders has not overcome the trouble. On the other hand, the wear of piston-rod packing is but slightly affected. The C.P.R. reports that in the case of cylinder packing rings, the life was from 1 to 18 months

Fig. 4. Design of Nozzle for Injecting Oil into the Firebox.

a 3-stall section to the roundhouse at Fort Erie. Each stall has a pit its full length under the cars. These pits each have air, water and oil connections. The oil is brought in through a 1 1/2-in. hose and pipe connection under 5 lbs. of air pressure, from three 7-ft. diam. and 7-ft. high tanks located in an underground chamber 15 ft. long, 10 ft. wide and 10 ft. deep, made of concrete. This chamber has four vent holes in its roof. The tanks are piped to operate independently, so that two may be filling by gravity from tank cars alongside, while the third is being used to fill the car tank. Beside the connections in the building, there are similar attachments to an outside track.

No tests have been made to determine the ultimate velocity attainable with this car, but over 40 miles an hour can be made and held for considerable periods. The 20-mile run between Black Rock and Port Colborne was made during the last summer season in the scheduled time of one hour, which included 10 stops, or at the average speed of 20 miles an hour. The car comes up to speed more rapidly than would a full train.

As might be supposed, from a fuel standpoint, this car is more expensive to operate than its coalfiring twin, for the price of oil is high as compared to coal. The fact that a fireman can be dispensed with, makes the net cost of operation less than the other. Not only that, but the service is more popular from the fact that the car is cleaner, and many

practically no changes have been made. Oil is being delivered to the centre of the steam-chest for slide valves and inside-admission piston valves; while for outside-admission piston valves, the oil is introduced into the ends of the valve chamber. In some cases, the cylinders have been tapped to receive direct lubrication at a point in the middle of the bore, and near the top. Experience with this method leads to the belief that equally good results can be obtained by the usual methods of feeding the oil to the steam-chest.

All roads reporting have found it unnecessary to change the quality of the oil with low-degree superheat; and the increased quantity consumed is but slight. Oil with a flash point of about 520 degrees F. is the kind used. Mileage reports per pint vary widely, depending upon locomotive size; the figures range from 35 to 75.

Little data were received relative to the wear of valve and cylinder packing with a low degree of superheat although in some cases, the wear appears to be a little more rapid. No case is cited of any change of material being made, nor was the rod packing changed.

Eight railways reported the use of smoke-tube superheaters. The superheat obtained varies from 100 to 200 degrees with corresponding steam temperatures of from 490 to 580 degrees F.

Differences in boiler pressure were found to have no influence in the proper lubrication of valves and cylinders of locomotives using superheated steam.

when using superheated steam, as against 12 to 24 months with saturated. Valve packing rings last from 12 to 24 months with superheated steam. In both cases, cast iron is the packing ring material.

The information received on lubrication agreed so closely that the following conclusions become certain:

1. The conditions of lubrication are practically unchanged by the degree of superheat commonly obtained from smoke box superheaters.

2. The flash point of oil should be higher than the temperature to which it will be subjected at the point where lubrication is to be effected.

3. The hydrostatic lubrication meets the requirements of proper oil delivery.

4. The life of common gray iron packing rings is too short to commend this material for use with high-degree superheat.

Pacific Type Locomotives for the Grand Trunk Pacific Railway.

The G.T.P.R. has received recently 15 Pacific type locomotives built by the Montreal Locomotive Works, one of which is illustrated herewith. The design embodies a number of features which, while they have been successfully applied to a number of locomotives built within the past two years for railways in the United States, have not heretofore been extensively used on Canadian locomotives. It therefore possesses more than the usual interest.

Among these new features will be noticed the self-centering guide for the valve stem and the outside bearing radial truck. The valve stem guide, which is very clearly shown in the illustration of the general view of the locomotive, is made integral with the back head of the piston valve chamber, and so constructed as to be easily adjusted for wear. It can, therefore, be erected, taken down and replaced without any lining up, at the same time ensuring that the guide is absolutely in line with the piston valve chamber. This saves considerable time which is consumed with the valve stem guide of the ordinary construction employed with the Walschaert valve gear when it becomes necessary to take down the valve motion. In case of wear,

ing radial truck, a detailed illustration of which is given, obviates the use of outside supplementary frames secured to the rear portion of the main frames by heavy cast steel filling pieces, which some of the other designs of this style of truck require. In this way it effects a considerable saving in weight—in the ordinary design from 2,500 to 3,000 lbs.

The floating spring yoke hinged to the

Radial Trailing Truck, G.T.P.R. Pacific Type Locomotive.

main frame, combined with the drop forged sphere which furnishes support for the spring seat, provides for a universal adjustment of the springs to the rise and fall of the engine. Double inclined friction plates between the spring seat and the top of the journal box provide a resistance to transverse motion and assists the action of the spring centering device to restore the truck to its normal central position on entering a

carried on the driving wheels, and the remainder on the front and trailing trucks. With cylinders 22 ins. in diameter by 28 in. stroke, 73 in. drivers and a boiler pressure of 200 lbs., the maximum theoretical tractive power is 31,600 lbs. Other general dimensions, etc., are given in the following table:—

Gauge	4 ft. 8½ ins.
Weight on drivers	143,500 lbs.
Weight on truck	43,000 lbs.
Weight on trailers	33,400 lbs.
Weight, total of engine	219,900 lbs.
Weight of tender	143,000 lbs.
Wheel base, driving	13 ft. 4 ins.
Wheel base, total of engine	33 ft. 3½ ins.
Wheel base, total of engine and tender	62 ft. 3½ ins.
Cylinders, diameter and stroke	22 by 28 ins.
Type of gear	Walschaert
Diameter of piston valve	14 ins.
Maximum valve travel	6 ins.
Outside lap	1-16 ins.
Inside clearance	3-16 ins.
Lead in full gear	1-16 in. forward, 7-16 in. back
Driving wheels, diameter outside	73 ins.
Trailing wheels, diameter outside	49 ins.
Driving journals, diameter and length	9½ x 12 ins.
Trailing journals, diameter and length	8 x 14 ins.
Engine truck wheels, diameter	31 ins.
Engine truck journals	6½ x 10½ ins.
Boiler type	Straight top, radial stay
Boiler, outside diameter at first ring	70½ ins.
Boiler, outside diameter largest course	73 ins.
Working pressure	200 lbs.
Firebox, length	96½ ins.
Firebox, width	75¼ ins.
Firebox, water space, front	5½ ins.
Firebox, water space, back and sides	4½ ins.
Tubes, material	Kerr's seamless steel
Tubes, no. of	303
Tubes, spacing	2¾ ins.
Tubes, diameter	2 ins.
Tubes, length	20 ft. 6 ins.
Heating surface, tubes	3,239 sq. ft.
Heating surface, firebox	169 sq. ft.
Heating surface, total	3,408 sq. ft.
Grate surface	50.59 sq. ft.
Tender, water capacity	8,000 gals.
Tender, coal capacity	10 tons
Tank, kind	Waterbottom
Length over all, engine and tender	72 ft. 9 ins.
Extreme width	10 ft. 6½ ins.
Extreme height	15 ft. 2¾ ins.
Brakes	Westinghouse-American on drivers, engine truck trailers and for train

Frames Cast steel single, front rails integral with main frame

Fire door Franklin pneumatic

These locomotives have been placed in passenger service between Winnipeg and Edmonton, and we are advised that they are giving every satisfaction.

The Eastern Terminal Realty Co. has been incorporated under the New Brunswick Companies Act to promote immigration and settlement in the province,

Grand Trunk Pacific Railway Pacific Type Locomotive.

liners are provided on the top and bottom of the guide which can be removed or inserted as may be required. It is self-supporting so that no bracing from the guides or any other source than the cylinder is required, which is another advantage. It also permits the use of a straight design of combination lever, without forks, which is connected to the valve stem cross head by a pin passing through the wings of the latter and thus affords greater lateral stability than is obtained in other designs.

The improved design of outside bear-

tangent after passing through a curve. This gives the track excellent riding qualities, as experience has proven. With the construction used for supporting the spring seats, not only is flexibility provided, but all the spring seats are in compression. Thus, any wear and loss motion which may accumulate is automatically taken up.

In point of weight, the locomotive here illustrated is among the heaviest of its type in service in Canada. In working order it has a total weight of 219,900 lbs., of which 143,500 lbs. are

to deal in lands, to promote the establishment of industries, and in connection therewith to build or promote the building of docks, wharves, railways and tunnels, and to own and operate steam and other vessels. The capital is fixed at \$150,000; the company's offices are in St. John, and the provisional directors are:—A. E. Massie, H. F. Puddington, D. F. Pidgeon, W. H. Harrison, St. John; T. Bell, Rothesay, N.B.

The G.T.R. is opening an uptown ticket office in Stratford, Ont., with Deacon and Trow as agents.

Railway Mechanical Methods and Devices.

Maintaining Fuel Oil Pressure at the Pere Marquette Rd. Shops.

The Pere Marquette Rd. shops at St. Thomas, Ont., have a very simple little pump arrangement for maintaining a pressure on the fuel oil, which is used quite extensively throughout the shops for heating purposes. Its use has been found much more satisfactory where a constant pressure is maintained, keeping the flame from fluctuating to too great an extent, thereby making it possible for the workman to obtain more uniform results.

The arrangement is bolted to the wall, about 8 ft. above the floor, and consists essentially of a pump cylinder A, in which a plunger operates, actuated by a long connecting rod, the lower end of which is shown at B. This connecting rod, of about 10 ft. length, connects to an eccentric on the main line shaft, thereby being given a short throw, sufficient to give a plunger displacement of about 3 ins. The pump is composed solely of a piece of piping capped at its lower end, with a packed joint for the plunger at the upper end; the plunger is guided still further by a bracket just above the pump. The pump valves are simple, consisting of two check valves, arranged in opposite directions for the delivery and intake pipes.

The air chambers C in the delivery pipe D maintains a steady flow; this chamber is connected in a simple manner by a tee. The intake pipe is the lower one, E. The chamber F, into which both delivery and intake pipes enter, is the by-pass for short circuiting the oil back to the pump when the desired pressure is exceeded. This desired pressure may be regulated at will through the screw G, which regulates the compression of the spring on the balanced valve in F. When the oil pressure exceeds the set amount, the valve in F opens, allow-

Wall Pump for Maintaining Fuel Oil Pressure.

ing the oil to flow around from D through F to E, and again into the pump.

The pressure maintained may at all times be seen by connecting a gauge to the tube H, which is done at a point nearer the floor, where it may be easily read. The arrangement gives no trouble, lubricating itself and keeping in condition at all times. Being direct-connected to the line-shaft through the eccentric, insures a maintenance of the pressure as long as the shop is in operation. No means are provided for throwing the mechanism out of gear, and experience seems to show that no such means are required.

Boiler Tube Beading Tool Gauge at the M.C.R. St. Thomas Shops.

The New York Central Lines, in common with most other steam roads, have experienced considerable annoyance in the past with leaky flues. This is a difficulty that seemingly cannot be overcome, it being necessary to caulk the joints with a beading tool quite frequently—on some heavy runs as often as once a trip, although this is a rare instance.

As customarily made, both the blacksmith and toolmaker use their own judgments in the respective operations of forming and finishing the beading

Boiler Tube Beading Tool Gauge.

tool previous to tempering. The consequence is that at different points on the same railway system, different ideas prevail with regard to the depth of the bead.

The locomotive as originally built at the shops has a certain bead given to the tube ends. The first time it is in the repair shop, the chances are that a beading tool giving a slightly different bead will be used—possibly one flattening down the bead. If the locomotive goes to another shop for the next tube tightening, a tool with a deeper bead

definite form to follow, leading to a uniformity of bead, and what is more important, increased life for the tubes.

This is not an entirely new practice on steam roads, as a number now employ such a system of standard tools, but the majority of lines have yet to be shown the advantage of employing some such systems.

Piston Packing Rings at the Intercolonial Railway Shops.

Nearly every railway has its own design of piston packing rings, and it may truly be said that their number is legion.

Each one has generally been developed with a view to meeting best the requirements of the particular line with which the design is connected.

The Intercolonial Ry. has a three-piece design, such as is shown in the foreground in the accompanying illustration. These three pieces, when assembled from the hollow frustum of a cone, the inside diameter being that of the piston rod to be packed. The smaller end of this composite frustum is beveled off, the whole construction being as shown in the illustration. These several

Moulds for Piston Packing Rings.

may be used. The consequence of this last will be to form a groove in the tube sheet around the flue, resulting from the tool protruding, due to the greater depth of the tool bead. A few repetitions of this sequence of differently formed tools soon ruins the tube ends, necessitating safe-ending.

The New York Central Lines have overcome this difficulty by having the beading tools over the whole system made to a standard gauge of the type shown in the accompanying illustration. These gauges are made of 1/2-in. steel plate, different gauges being used for the various tubes to be beaded. The toolmaker and blacksmith thus have a

parts of the cone frustum construction are radially slitted to allow for inward spring for the cone surface, to compensate for internal wear from the piston rod.

The method of manufacture is interesting, a set of moulds being employed for the purpose, the whole being as shown in the illustration. The mould for each of the rings is shown with its respective ring leaning against it. The mould is entirely contained in a circular block of steel. A swinging cover fits over top, two holes in the top registering with the annular channel in the mould; these holes are for pouring and vent purposes, the cover being held

tightly down on the mould during that operation.

In practice, they are made in sets of three, the first one being sufficiently set to be removed by the time the third one is poured, and so on, making the process of manufacture continuous through the employment of the three moulds. In removing from the mould, a side blow with a hammer on the cover handle, swings the latter to one side, the spine remaining in the pouring holes being sheared off by the hole, leaving a clean surface.

Piles of the completed sets of packing rings are to be seen in the right background of the illustration.

The Steam Hammer as a Drop Forge.

The use of the steam hammer as a drop forge is rather unusual practice, but it is being thus employed in the Montreal Locomotive Works blacksmith shop, J. G. Boyer, foreman.

A light, enclosed frame hammer, as shown in fig. 1, is employed, the operation of the machine being identically the same as in drop-hammer forging.

The die-blocks, as will be noted in fig. 2, are precisely the same as drop-

Fig. 1. Steam Hammer used as a Drop Forge.

hammer die-blocks, with the usual breakdown, finishing and cutting off dies. An example of the work possible in this machine is shown in this illustration. Equally good work is possible by this machine as could be obtained from standard drop-forging machines.

Indirect Lighting of Railway Cars has been successfully accomplished by the Atcheson, Topeka and Santa Fe Ry. on several new dining cars recently placed in service. The lighting fixture, suspended from bronze chains, consists of a heavy leaded bowl of sufficient density to give a soft color and display to advantage the design, without transmitting any useful light. The illumination comes from the light in the bowl being deflected downward from the dull ivory-white ceiling, which makes a good reflector. The side walls of the car are finished in mahogany, and the floors, with green carpet. The light distribution determined from illuminometer tests, is remarkably uniform.

Drill for Boring between Car Sills at Michigan Central Rd. Shops

For boring holes in the centre sills of freight cars, the ordinary brace and bit proves of little value owing to the cramped position and the little free space for the brace to operate. Neil Marple, General Foreman, M.C.R. car shops, St. Thomas, Ont., has introduced a drill for getting into these awkward corners which has none of the defects of the ordinary brace and bit, but which is at the same time quite simple in construction, as the accompanying illustration shows.

The drill consists of a base on which the operator rests his foot while drilling to hold in the one location; to which an upright is hinged as indicated. This

Drill for Boring between Car Sills.

base and upright are both made of wood. Secured to the top of the upright is a chuck, held in two bearings, and into which the bit is secured by a set screw. The bit is driven by the chain and sprocket, the driving handle being located some distance down the upright in order to clear the sills being drilled. The whole construction is clearly shown by the illustration. Not only has this device proved of value for drilling between sills, but there are many other cramped locations around a car where its merits have been demonstrated, as an examination will show that the space required is only slightly greater than the length of the bit itself. The car builders find it an invaluable aid.

Screw Reverse Gear for C.P.R. Locomotives.

Three of the large Pacific type passenger locomotives recently built at the C.P.R. Angus shops, Montreal, have been equipped with a screw reverse gear, the arrangement and details of which are shown in the accompanying illustrations. Screw reverse gear practice has been more or less common on European roads

weighted with an adjustable disc to balance the dead weight of radius rod and other parts indirectly suspended from the bell-crank, is connected by lengths of 2-in. extra heavy pipe to the screw reverse mechanism. These pipe lengths have an intervening section of 3-in. rod, to which they are connected by knuckles. The bearings are bolted to a stand attached to the side of the boiler, as indicated. These sections of pipe, with guiding rod, replace the customary reach rod.

bronze nut, which cannot revolve. The nut has a 2 3/8-in. triple, 1 1/2-in. pitch square thread. A square-threaded operating screw, on the end of which is bolted a 10-in. hand wheel, fits the crosshead, providing the means of moving the latter forward and backward. The operating screw is carried at the wheel end by a bearing in the holding casting. To lessen the turning friction due to end thrust when putting engine in or out of gear, ball-bearing thrust plates are pro-

Fig. 1. Screw Reverse Gear as applied to C.P.R. Pacific Type Locomotives.

for a number of years, but it was only during the last year that the first installation was made to a locomotive on this continent, a powerful mountain type passenger locomotive built by the American Locomotive Co. for the Chesapeake and Ohio Ry. being so equipped. The most noted instance of the screw reverse mechanism is on the large experimental Pacific type locomotive no. 50,000, recently built by the American Locomo-

The screw reverse mechanism is mounted in a casting attached to the side of the firebox at such a height that the operating wheel is in line with the cab window sill, in a convenient location for the engineer to operate. The more important details of the mechanism are illustrated in fig. 2. The second pipe length is screw connected to a ball-connecting link, and a positive location obtained by a no. 8

vided, one on each side of the thrust bearing; the construction of these is shown in the illustration. A retaining collar screwed on the operating screw, and located by a no. 8 taper pin fitted after assembling, carries the backward thrust when shoving the crosshead forward. The flange of the operating screw to which the hand wheel is attached, has 10 notches around its periphery, into

Fig. 2. Main Details of the Screw Reverse Gear Mechanism.

tive Co. for experimental purposes to determine the minimum weight per horsepower, and described in this issue. The C.P.R., always to the front in motive power improvements, has equipped the three locomotives already mentioned, and in addition, has a further series of 15 on which the gear is to be installed. The general arrangement of the screw reverse gear and connections is shown in fig. 1. The usual bell-crank, counter-

taper pin through both members. This ball connecting link is of cast steel, turned to a true sphere on the ball end, with the balance ground smooth. This spherical end fits a built-up cast-iron crosshead which is guided in the mechanism by upper and lower guides fitting the two end pieces of the cross-head. The right-hand end piece forms half of the ball seat for the spherical end of the ball connecting link, while the other end piece retains in position a squared

which a latch, pin-connected to the end of the upper guide, fits. A stop, pressed forward in the drilled hole in the end of the upper guide into notches in the latch, holds the latter out of engagement when changing the gear location. Ten positions of latching per revolution are thus provided, and, as the pitch is 1 1/2 in., an adjustment of less than 1/8 in. is made possible. The screw reverse gear has several inherent points of superiority over the

old reverse lever, two of which stand out most prominently. In the first place, a very fine adjustment is made possible, which for high-speed passenger work is most desirable. Secondly, at very high speeds, under the lever system, adjusting the valve travel becomes a more or less risky undertaking, due to the possibility of the reverse lever flying out of the hands of the engineer. The ordinary reverse lever is becoming quite inadequate to handle the gear of such

locomotives as are being built at the present day.

The C.P.R. Mechanical Department is considering the possibility of installing this screw reverse gear on the large Mallet locomotives described in *The Railway and Marine World* for March. Some difficulty has been experienced, due to the freezing of the power reverse gear of these locomotives, leading to the consideration of installing the screw reverse mechanism.

Experimental Pacific Type Locomotive.

To fittingly mark the construction of its 50,000th locomotive, and at the same time to determine the limit to which the efficiency and capacity of a passenger locomotive of standard general arrangement could be carried without exceeding conservative axle loads, the American Locomotive Co. has recently built, at its own expense, an experimental Pacific type locomotive, embodying many improvements both in design and materials of construction. Being unhampered by the necessity of working to standard railway specifications, a free scope was offered towards using those designs in locomotive engineering practice that to the designers appeared best. So well have the refinements been work-

through two 15-in. doors. In the forward end of the firebox there is a brick arch, increasing the capacity another 10%. The equivalent evaporating surface is quite large, amounting to 5,394 sq. ft., due largely to the proportions of the Schmidt superheater, the largest of its kind ever installed in a locomotive in America, consisting of a front header with 36 superheater units leading therefrom. Under test, the average superheat was 276°, reaching a maximum of 341°. The large size of the superheater accounted for an economy of 13% over a locomotive of similar size but smaller superheater capacity. The boiler has 207 2½-in. tubes, 22 ft. long. The boiler pressure is 185 lbs.

the gear both a safeguard, and a further means of cut-off refinement leading to increased economy.

An improved form of radial bearing truck has been used, resulting in a weight elimination of nearly 5,000 lbs. This truck provides for a universal adjustment of the springs to the rise and fall of the locomotive, and a resistance to traverse motion through the combined action of the spring centering device and the inclined friction plates, which operate to restore the truck to its normal central position on entering a tangent after passing a curve.

A very important feature of weight reduction and improved design lies in the use of a pressed steel bumper and pilot. Between the two, over 1,500 lbs. dead weight is removed, as well as introducing a decided advance on cast-steel bumpers.

This new locomotive marks an epoch in design, being, it is claimed, the most perfect from the economy and capacity standpoint within the limitations of conservative wheel loads yet produced. It emphasizes most emphatically how present day standard locomotive practice may be improved by better proportioning of boiler and engine capacity, greater refinement in the design of details, and modification of present day stand-

Experimental Pacific Type Locomotive Capable of Developing One Horsepower per 121.4 lbs. of Weight.

ed out, that in actual service, this 269,000-lb. locomotive has been able to develop 2,216 horsepower, i.e., one h.p. for every 121.4 lbs. of weight. This is said to be 25% more efficient than the ordinary Pacific type locomotive. The maximum tractive power is 38,400 lbs.

It embodies the latest knowledge of general proportions, the most recent developments in materials and improvements in the design of details, combined with best use of approved fuel-saving devices to secure the utmost possible economy of the locomotive as a whole from the operating standpoint. Many improvements over long accepted conventional practice in the design and construction of some of the principal details introduced in this locomotive have since been adopted as standard practice by the builders and widely applied to a large number of other locomotives with a marked degree of success.

To obtain maximum sustained capacity, the boiler must be of generous proportions, and well designed. In order to increase the boiler size without unduly increasing the total locomotive weight, a process of weight elimination in all parts of the locomotive was resorted to. The boiler, of a conical construction, received the most attention. The difference in diameters between the front and rear courses provides a large steam space, decreasing the tendency for wet steam to be carried over into the superheater. The dome course is 37 ins. in diameter, and the front course, 75 ins. The firebox, 114 by 75¼ ins., has a grate area of 59.75 sq. ft., and is fed

The cylinders are vanadium steel castings, with thin vanadium cast iron bushings, this construction eliminating a weight of no less than 4,000 lbs. in this detail of the locomotive alone. This, together with outside pipe connections from the superheater, results in a decided simplification and betterment of the castings. Vanadium steel is used elsewhere in the locomotive, these parts including driving-wheel centres, frames, rods, crankpins, piston rods, valve motion parts and springs. These parts are of standard design, but much lighter.

A self-centering valve stem guide, of a type recently designed and installed on locomotives latterly constructed by this company, is used. This guide is cast integral with the back head of the piston valve chamber, and in consequence, requires no lining up, and is always correctly set. An extended piston rod guide of the self-centering type, is also embodied. This consists of a cast-iron shoe fitted to a cast-steel body on the extended end of the piston rod, and to which it is securely attached. The shoe slides in a guide bolted to the cylinder head, corresponding circular faces correctly aligning it in place. The top of the guide casting is open, so that the shoe may be readily removed when on either centre without bumper interference. The bearing surface is circular.

This locomotive is one of the first in America to apply the screw reverse mechanism, the design of which is very similar to the C.P.R. one outlined elsewhere in this issue. The locomotive being so large makes the application of

ards, and the best use of fuel saving devices. It undoubtedly makes a long stride towards obtaining maximum power per unit of weight, eclipsing all previous performances.

Demands for Increased Wages by the locomotive engineers of the U.S. railways east of Chicago and north of Virginia are to be considered by a committee of 12 vice presidents and general managers. The schedule of pay demanded by the engine runners is as follows: In passenger service, for engines with cylinders of 20 ins. or less diameter, \$4.20 per 100 miles or less; engines with larger diameter cylinders, \$4.60 per 100 miles; overtime to be paid for at 70c. an hour on the basis of 20 miles run per hour; electric locomotives to be run at the same rate as steam locomotives; freight service, minimum rate, \$5.25 per 100 miles for engines with 20-in. cylinders or less; \$5.50 for engines with cylinders of 20 to 24 ins., \$5.55 for larger cylinders; Mallet locomotives, \$7. One hundred miles or less, or 10 hours or less, is to constitute a day's work. Overtime is to be paid for on the minute basis at an average speed of 10 miles an hour. Switching engines and yard service, \$4.50 per day of 10 hours; belt-line locomotives, \$5 per day of 10 hours.

H. G. Barber, Assistant Engineer, C.P.R., Construction Department, Calgary, Alta., in remitting his renewal subscription, writes:—"The Railway and Marine World becomes more necessary to railway men all the time."

Steam Railway Statistics for Year Ended June 30, 1911.

The table given in our last issue showed the financial results of the operations of steam railways for the year ended June 30, 1911. The following table gives the percentages and the principal statistical information compiled by the companies. The table published last issue and the one given below contain all the information given prior to 1910 in our compilation of these statistics, but the columns have been rearranged so as to combine in the first table the financial and in the second the statistical information.

Name of Railway	Proportion of total Passenger service to train revenue to total earnings	Proportion of freight revenue plus switching revenue, &c., to total earnings	Revenue Train Mileage	Mileage of Non Revenue Trains	Earnings per Train Mile	Passengers Carried	Passengers Carried One Mile	Passenger Earnings per Train Mile	Tons of Freight Carried	Tons of Freight Carried One Mile	Freight Earnings per Train Mile

Little Leaks on Railways.

By W. C. Hunter, ex-Manager New Brunswick Coal and Ry. Co. Ltd.

The scientific management of railways appears to be a favorite theme with college professors, editors, magazine writers, lawyers and students of political economy generally. Wasteful methods of the roads are alleged, and figures are given to show what might be saved per annum if this or that theory were adopted, until it would almost seem that an absurd inference of the public must be, that the management of our railways is entrusted to a lot of untrained incompetents. However, the attention that is being paid to this subject is, after all, but a manifestation of a spirit of conservation of energy and resources that is none too soon moving our people, in this case directed at the railways, for it seems to be the fashion to criticize the railways as the greatest offenders in any case, or on all subjects. But after all there is some excuse for even this, inasmuch as the railways bulk large in the public eye, as perhaps the greatest existing single form of energy, and coming in closer contact with and affecting the masses to a more general degree than any other form of human effort.

Manifestations of the same spirit are in some degree being directed at other great industries, such as mining, lumbering, etc., and indeed with very much more reason to warrant it; for while wasteful methods exist to an all too great a degree in many fields of endeavor, it can be truthfully stated that the railways are not by any means the greatest offenders in this respect. Much has been, and can be shown, to prove this; all railway men know what enormous efforts have been made in the last quarter of a century to obtain increased service at less percentage of cost, but after all, has everything been done that can be done, practically, to obtain still further results in economy by eliminating all waste? Immense sums of money have been spent, and are being spent along the lines of betterment of the railways physically, and in increasing the size of power and in lowering the relative cost of maintenance by better shops, machinery and methods, and almost every important road is increasing the educational facilities of the employees to the end that they will be taught to do their work intelligently and effectively, with less waste of energy, a

course which cannot help but have splendid results. But after all has been said and done, there are few railways but have little leaks in every department, at almost every point, which, if they were stopped would effect a surprising aggregate saving. To name all these small wastes that are apparent to an observer, and what might be done to eliminate them, would take up a lot of space to discuss, but in these days of constantly increasing operating expense, the struggle to correspondingly increase net earnings, or even to keep them from decreasing, is such that any practicable plan to increase economy, or to stop waste, no matter how small, warrants consideration. If it has been one's good fortune to travel over many of the railway systems of the country, and to have visited storehouses, repair shops, round-houses, station agents' offices, car inspectors' quarters, section houses, trackmen's shelters, water stations, conductors' cabooses, locomotives, etc., etc., one cannot help observing, no matter how perfect the system of handling supplies may be, or how often the regular officers may inspect all points, or, generally speaking, how well managed a road may be, there is still a constant waste of material going on in small quantities, one would think almost too small to notice; but when it is going on constantly all over a large system—a little here, a little there—the aggregate loss must be very considerable indeed. At some points of course it is worse than others, as on some railways it is worse than others, but all roads are losing more or less money from these little leaks. How to apply a remedy is a very pertinent question.

As a suggestion, let the management of any of our large railways select a man of general all-round experience, entitle him say, general inspector, reporting to the general manager, but making joint reports to the heads of any of the departments, divisions or districts concerned, and turn him loose on the system with authority to do all possible to eliminate waste in every department and at every point at which he can discover the same, at any one or succession of visits he may make, and let this be his only aim and duty. Such a man would require to have had experience in several departments, to be observant,

and to be possessed of patience, tact, and common sense combined with firmness, and it would be necessary that he be supported strongly by his superior officer.

Let us see what such an officer may find in a trip of one day over, say, one division. He starts out on an early morning local passenger train; he may possibly find the trainmen do not properly announce stations, result, passengers are not ready to leave the train quickly to make room for passengers getting on the train, wasting time, which costs money to make up. He can instruct these trainmen in regard to this; he may find the trainmen do not handle the air whistle cord according to their instructions, wasting air, causing air pump to use more coal. Then he notices the car lamps are burning too long after daylight; waste of gas or oil. He gets off at a way station where there is a section house, and a water tank, and perhaps a coal chute, possibly he finds the train signal lamps still burning, or, if in afternoon, lighted too soon, more waste of oil. He may notice the agent at the station using good printed forms to scribble or figure on, or using a large train billing forms for freight shipments where the small size would do, a waste of stationery, and which waste is surprisingly general. The telegraph battery jars may show need of cleaning, so that station instruments would get full power, saving time in adjusting instruments when required. He then visits the tank; possibly the tank man is using too much fuel, or oil, on the pumping machinery, or there may be an unreported small leak in the tank, wasting water; at the section house he is likely to find scrap that should be sent to the nearest repair shop, these section tool house small scrap piles, more often than not, contain good brake gear, bolts, nuts, and pieces of scrap brass, and tools picked up on the track that have fallen from locomotives. Along the right of way are ash heaps where old ties were burned, that if raked would possibly be found to contain some good spikes, as well as many broken ones; the latter make good wrought iron scrap, and should be picked up.

About this time a freight train arrives, and the general inspector may notice the air brake rules for making water station stops are not obeyed, and damage is consequently done to draft rigging and lading. The locomotive is at last "set" to take water, and he may notice the fireman haul the drop pipe

of the tank or stand pipe down with a bang, on to the edge of the tender man-hole, causing damage to pipe, then the tender may be overflowed, waste of water, besides washing off coal or at least damaging its heating quality, or if it is in winter, ice is formed on the track, costing money to remove.

He may notice the locomotive engineer is using a leaky or broken spout oil can, or the lubricator pipe connections and packing of the sight feed glasses are leaking, causing waste of oil. If at a coaling station he may observe that the tender is overloaded, so that coal is wasted by dropping off when the locomotive is running. If he rides on the engine for a few miles he may find wasteful methods of handling fuel and rough handling of the train, and rough braking, all wasteful. When he rides in the caboose he may find worn out car journal brasses which have not been turned in, and perhaps too many new ones on hand, an over stock of spare coupler knuckles, too many spare air hose and coupling gaskets, which deteriorate fast in non-use, and quite likely there will be found a scarcity of proper tools for replacing hose or gaskets on the road, resulting in loss of time. The same remarks may, or may not, apply to all the supplies with which the caboose is supposed to be equipped.

The inspector may ride this freight train to a divisional terminal, finding opportunities to effect economy all along the road. If it is a way freight train, he may find package freight badly loaded, so that delays occur at way stations while box cars are overhauled for the "pieces" that should have been handy if "station location loading" had been followed when the car was loaded at starting point; he may find rough switching done by the crew at the way stations, damaging lading and draft gear, which may not be apparent at the time, but sooner or later has to be paid for; air hose may not be uncoupled by hand, resulting in damage to hose that will certainly have costly consequences; he may, if it is cold weather, find cars being moved from spur tracks at way stations with the brake shoes frozen to the wheels, or even if it is not cold weather the same cars being moved with the hand brakes set, resulting in slid flat wheels.

Arriving at the divisional terminal the inspector will have an opportunity to observe if the locomotive is switched to the roundhouse quickly, to avoid extra time to be paid to crew, waste of fuel, etc. He may note if car inspectors are on hand as quickly as possible to inspect the train, and if the train is going on to the next division he may note whether wasteful loss of time occurs through the actions of any of the departments concerned; he may visit the car inspector quarters, and if he looks about carefully he may find a few obsolete brass car bearings and car castings long cherished in some corner and kept for an emergency, that will never occur, because the "foreign cars that use them" are out of service long ago.

At the roundhouse the inspector may find worn out parts of injectors, lubricators, pumps, air brake parts and non-descript pieces of brass, and in the private locker of some foreman or charge hand he may find a collection of spare parts of obsolete devices, kept because they "may come in handy" some day.

If the inspector visits repair shops he may find obsolete car or locomotive castings, scrap cast or malleable iron, and scrap brass which should be disposed of more quickly, wheels of obsolete design or size of journal, or he may find broken bolts scrapped that should be recut, or he may have opportunity to point out improved methods of handling some small matters from ideas which he may have picked at another point on the system. In the storehouse he is likely

to find supplies that have been in stock so long that it is obvious they are obsolete, but are kept as stock for book-keeping reasons only. He may visit a terminal freight station and be able to point out the best methods for loading freight and way cars to avoid delay on the road or at transfer points with other railways, thus saving car delays.

And so on all over the system day in and day out, such an officer could be ever busy constantly watching for little leaks and studying more economical methods of handling detail. It may be argued that all this is the duty of the regular officers, which is true enough, but their duties are multiple, they have many questions cropping up daily; their routine work never ceases, and while, of course, they should never lose sight of the fact that strict economy is required, still it is not humanly possible for them to notice thousands of small leaks that are occurring, but which could be traced down and eliminated by an officer whose time was devoted to that and nothing else. It does not seem impossible if such an official were the right kind of a man that he could save any large railway system many thousands of dollars annually.

[The writer of the foregoing article, W. C. Hunter, was formerly Manager, New Brunswick Coal and Ry. Co., since resigning which position he has been railway representative for T. McAvity and Sons, Ltd., St. John, N.B.—EDITOR.]

Birthdays of Transportation Men in April.

Many happy returns of the day to—
P. T. Anderson, Car Service Agent, C.P.R. Western Lines, Calgary, Alta., born at Lambeth, Ont., April 1, 1878.

W. H. Ardley, General Auditor, G.T.R., Montreal, born at London, Eng., Apr. 24, 1858.

Jas. Black, Freight Claim Agent, C.P.R., Vancouver, B.C., born near Seaford, Ont., Apr. 19, 1858.

C. G. Bowker, Joint Superintendent, G.T.R. and Wabash Rd., St. Thomas, Ont., born at Medford, N.J., Apr. 21, 1871.

W. J. Camp, Assistant Manager Telegraphs, C.P.R., Montreal, born at Oakville, Ont., Apr. 22, 1855.

G. Cobb, Chief Dispatcher, Reid Newfoundland Co., St. John's, Nfld., born at Coupar Angus, Scotland, Apr. 21, 1885.

A. E. Edmonds, District Passenger Agent, C.P.R., Detroit, Mich., born at Woodstock, Ont., April 8, 1866.

J. H. Flock, K.C., Honorary Counsel, Canadian Ticket Agents' Association, London, Ont., born at Toronto, April 6, 1834.

B. W. Folger, General Manager, Niagara Navigation Co., Toronto, born at Kingston, Ont., April 8, 1872.

B. C. Gesner, Moncton, N.B., formerly Air Brake Inspector, I.C.R., now travelling representative, Galena Signal Oil Co., born at Cornwallis, N.S., April 23, 1859.

J. Murray Gibbon, Advertising Agent, C.P.R., London, Eng., born at Udewella, Ceylon, April 12, 1875.

V. A. Harshaw, Superintendent, District 2, Atlantic Division, C.P.R., Woodstock, N.B., born at Mono, Ont., April 26, 1865.

J. M. Horn, District Freight Agent, Canadian Northern Ry., Edmonton, Alta., born at Allanton Mills, Lanarkshire, Scotland, April 12, 1880.

B. S. Jenkins, General Superintendent, C.P.R. Telegraphs, Winnipeg, born April 8, 1859.

J. Kyle, Master Mechanic, Western Division, Canadian Northern Ry., Edmonton, Alta., born at Toronto, April 11, 1877.

A. N. McIntyre, Trainmaster, C.P.R., Vancouver, B.C., born at St. Marys, Ont., April 9, 1874.

D. McNicoll, Vice President, C.P.R.,

Montreal, born at Arbroath, Scotland, April 7, 1852.

P. Mooney, General Freight and Passenger Agent, Halifax and South Western Ry., Halifax, N.S., born at St. Catharines, Que., April 19, 1871.

J. O. Norrie, Travelling Passenger Agent, C.P.R., Atlantic Steamship Lines, Winnipeg, born at Belfast, Ireland, April 20, 1879.

G. D. Perry, General Manager Great North Western Telegraph Co., Toronto, born at Whitby, Ont., April 19, 1858.

R. A. Pyne, Superintendent of Shops, C.P.R., Winnipeg, born at Toronto, April 10, 1874.

R. S. Richardson, Superintendent, Macdonnell & O'Brien, contractors, National Transcontinental Ry., La Tuque, Que., born at Napanee, Ont., April 9, 1865.

W. A. Ritchie, District Superintendent, Pullman Co., Montreal, born at Edinburgh, Scotland, April 13, 1854.

E. W. Smith, Superintendent, Dining and Parlor Car Service, G.T.R., Toronto, born at North Bridge, Mass., April 21, 1869.

W. S. Tilston, Chief of Montreal Board of Trade Transportation Bureau, born at Manchester, Eng., April 14, 1877.

W. Wainwright, Vice President, G.T.R., and Second Vice President, G.T.P.R., Montreal, born at Manchester, Eng., April 30, 1840.

W. Woollatt, Walkerville, Ont., ex-General Superintendent, Buffalo Division, Pere Marquette Rd., born at Weedon, Hertfordshire, Eng., April 2, 1855.

Equipment Directed for Snow Ploughs.

The Board of Railway Commissioners passed the following order 16007, Feb. 17:—

That all railway companies within the legislative authority of the Parliament of Canada operating snow ploughs shall, on or before Nov. 1, 1912, equip them with direct connection between the plough and the steam whistle of the locomotive, so that the man in the plough shall be able to give all proper signals; air gauge, air controlling valve and proper air connections between the plough and the locomotive, so that the air brake may be controlled from the plough.

That snow ploughs run as push ploughs, not fitted with cupolas, and having no men in charge, shall be fitted with air pipe connections between the plough and the locomotive, so that in case of derailment and air connections being broken, the air will apply automatically.

Canadian Northern Club of Toronto.

Officials and employees of the Canadian Northern Ry. and its allied lines in Toronto have organized the Canadian Northern Club of Toronto, for the exchange of ideas for obtaining and maintaining efficient service and for the improvement of the members in knowledge of construction and operation by discussion and investigation, and for the promotion of personal acquaintance and friendship. Meetings will be held on the first Tuesday of each month, at which papers will be read and discussed, with an occasional evening of entertainment.

Following is the organization:—Patrons, Sir William Mackenzie, Sir Donald Mann; Honorary President, D. B. Hanna; Honorary Vice President, H. K. Wicksteed, M. Can. Soc. C.E., G. H. Shaw; President, A. J. Hills; First Vice President, W. Phillips; Second Vice President, H. G. Hanna; Treasurer, J. W. Nicholson; Secretary, R. Crossdell; Chairman of House Committee, P. H. Scott; Chairman of Membership Committee, R. C. Vaughan.

Cross-Ties Purchased by Canadian Railways.

The data upon which this report is based were furnished by Canadian steam and electric railways. The value given for the ties was the cost at the point of purchase. There were 9,213,962 ties, costing \$3,535,628, purchased in 1910 by steam and electric roads. This represents a decrease of 4,964,279, or 35% from the number purchased in 1909, due to the decreased purchase of ties for new steam railway lines. This decrease was general throughout the important species except with Douglas fir. The average cost of these ties at the point of purchase was 38c., an increase of 1c. over 1909. Table 1 gives the number of ties of each kind of wood purchased in 1909 and 1910, with their total and average cost, and the per cent. each species forms of the total.

Three kinds of wood supplied 77% of all the ties purchased. These were cedar, jackpine and hemlock. Though not as many cedar ties were purchased in 1909 as in 1910, cedar is still the chief species used. In 1910, it furnished 40% of the ties purchased as against 29.8% in 1909. Nearly all the cedar used is eastern cedar (*Thuja occidentalis*), as western cedar (*Thuja plicata*) is too soft for satisfactory use as cross-ties, except for electric lines where the traffic is light. Jackpine is the second in importance in tie production. In 1910 it supplied 23.5% of the ties used, which was practically the same percentage as used in 1909.

one of the cheapest ties, has fallen off greatly, 657,871 ties less being purchased in 1910 than in 1909. The decrease in the purchase of spruce is due to the same reason as that ascribed to tamarack. The remaining species, cypress,

sawn ties is oak, 95% of which were sawn ties. Cedar ties were 81% hewn, and 61% of the jackpine ties were hewn. Hemlock and Douglas fir were about evenly divided in the method of manufacture. In the case of tamarack, 98% were hewn ties, while the minor varieties were principally sawn ties. The hewn ties are nearly all pole ties, the

	Total.....	2,791,671	1,005,098	36	30.	6,422,291	2,530,530	39	70.

chestnut, and white pine, are used to a small extent for ties. All the cypress and chestnut ties and practically all the oak were imported from the U.S. Red pine and yellow pine, which were used in 1909, were not reported in 1910.

The average price of ties in 1910 was 38c., compared with 37c. in 1909. Of the important woods, oak cost the most, 74c.

sawn ties are made chiefly from large timber.

Sawn ties cost on the average 36c. a tie. Hewn ties cost 3c. more, or 39c. a tie. Oak was the most expensive of sawn ties, costing 74c. a tie. White pine was the cheapest of the sawn ties, costing only 23c. a tie. In hewn ties oak was also the most expensive, costing 68c., and spruce ties were the cheapest, costing 25c. a tie.

Table 3 shows the number and cost of cross-ties used for steam railways in 1909 and 1910, classified by species, with the average cost per tie of each species and the per cent. each species forms of the total.

The steam railways, using 96% of all the ties, take them in about the same proportion and at the same prices as they are quoted in table 1. The decrease in use of ties in 1910, as noted above, is due chiefly to decreased purchase by the steam railways, which used 5,159,697 ties less in 1910 than in 1909. The average cost of steam railway ties is about the same as in table 1, due to the fact that nearly all the ties were purchased by steam roads. All the white pine and chestnut ties purchased in 1910 were purchased by steam roads.

Table 4 gives the number of ties purchased by steam roads in 1910, according to method by which made.

Steam roads use such a large proportion of the ties purchased that this table is practically the same as table 2. Hewn cypress ties were imported, but not used by steam roads.

(1) Less than one-tenth of one per cent.

Hemlock, supplying 13.8% of the total consumption, occupied third position in 1910. Hemlock has now for the first time passed tamarack as a tie producer. The advance of hemlock from the fourth position, which it previously held, is due not to an increase in the use of hemlock, but to a decrease in the use of tamarack. Douglas fir formed 9.6% of the ties purchased in 1910, as against 4.6% in 1909. About 232,000 more Douglas fir ties were purchased in 1910 than in 1909. This species was used to a greater extent by both steam and electric railways. Tamarack ties have dropped from third place in 1909, when they formed 19.8% of the total, to fifth place in 1910, when they formed only 7.1%. In 1910 only 663,922 tamarack ties were purchased, compared with 2,811,820 purchased in 1909. This great decrease of 2,147,898 ties is found entirely in the number used by steam roads, and is due to the fact that the purchase of ties for the eastern half of the National Transcontinental Ry. was completed previous to 1910. The above five species, namely, cedar, jackpine, hemlock, Douglas fir, and tamarack, represent 94% of the total number of ties used. Nearly all the remainder is made up of oak and spruce. The number of oak ties purchased in 1910 was 264,647, an increase of 230,258 over 1909. This is due to one United States railway, operating in Canada, which is using a great proportion of durable woods. Aside from this road Canadian railways use oak ties chiefly for switch ties. The use of spruce,

a tie, and spruce the least, 28c. a tie. Cedar cost 41c. a tie, compared with 45c. in 1909. Douglas fir cost 30c. a tie in 1910, or 4c. less than in 1909. The remaining woods, or all excepting these two, have advanced in price from 3 to 12c. a tie.

Table 2 gives the total number of ties purchased in 1910 by species and method of manufacture.

(1) Less than one-tenth of one per cent.

Approximately 70% of all the ties purchased in 1910 were hewn. It is apparent that methods of manufacture of ties are not undergoing any great general and permanent changes. Sawn ties were 30% of the total, which is the same proportion as in 1909. The only important species which has a majority of

Table 5 shows the number and cost of cross-ties used for electric railways in 1909 and 1910, classified by species, with the average cost per tie of each species and the per cent. each species forms of the total.

The electric railways used 4% of all the ties purchased in 1910. In 1910,

195,411 more ties were used by electric roads than in 1909, an increase of 182%, mainly in the use of cedar and Douglas fir. This is due to much increased construction. Nearly 50% of the total number used were cedar ties at a cost below the average, namely, 37c. Douglas fir constituted 32% of the total. Jackpine, being at a distance from the electric railways, was used only to the extent of 0.6%, the ties costing 51c. each. In steam roads 23% of the ties used were jackpine, and they cost only 33c. each. Very little spruce and no chestnut or white pine was used in the construction of electric roads. Over 10,000 cypress ties were imported at an average cost of 40c. each. This is the first report of cypress ties being used for electric roads.

The average cost of ties used in 1910 by electric roads was 41c., compared with 47c. in 1909. This is due largely to the decrease of 2c. a tie in the cost of cedar ties and 12c. in the cost of Douglas fir ties. It is an interesting fact that, although the average tie used by electric roads is smaller than that used by steam roads, the price paid for it is generally greater, viz., 3c. a tie more in 1910. This is due not only to the disadvantages incident to contracts for smaller quantities of material, but also to the fact that the electric roads are more likely to purchase ties at points where the price includes railway transportation charges. This is shown by the electric roads paying not less than 37c.

ed at Vancouver. The plant at Fort Frances will be capable of treating 2,000 ties a day. The zinc-chloride-aluminum patent immersing process will be used, which both prolongs the life of the timber and renders it fireproof. It is questionable if this process will give as good results in Canada as would creosote.

and occurs, fire-killed, in vast areas on the mountain slopes of Alberta and British Columbia. It cannot be used for lumber, on account of checking, and, if untreated, it lasts only about 5 years when used for railway ties. At present this wood stands dead and perfectly seasoned, and would take chemical treat-

This is a matter which for some years has been necessary for the preservation of the forests of Canada. At the same time it would have reduced the annual cost of railway maintenance. The average life of untreated ties as reported by the steam roads is: cedar, 9 years; tamarack, 8; hemlock, 7; Douglas fir, 7; jackpine, 6; spruce, 6. As may be noted from the tables, cedar is the species prin-

ment readily, after which it would make lasting and economical ties. By the use of such inferior qualities of timber, railway companies would assist conservation and at the same time decrease the cost of railway maintenance. The foregoing was issued recently as a bulletin by the Interior Department's Forestry Branch, having been compiled by H. R. MacMillan, B.S.A., M.F., and W. Guy H. Boyce. The zinc-chloride-aluminum process of tie preservation, which is being used by the Canadian Northern Ry. at Fort Frances, Ont., and the value of which, as compared with creosoting, is questioned, was adopted by the C.N.R. on the report of one of its officials, who recommended it in preference to creosoting.—Editor.]

Reduction of Industrial Accidents on Railways.—As the result of a campaign of education on the part of the Pennsylvania Rd. towards the reduction of industrial accidents on all parts of the system, more particularly in the shops, some remarkable results have been obtained. Whereas a year ago the industrial accidents averaged 8.7 per 1,000 employees per month, the number has now been reduced to 3.5, less than half. Shop inspection has, as a result of the beneficial results to be derived from this extra care, become a part of the P.R. Co.'s fixed policy. This inspection, the company claims, is made very reasonably, at a cost averaging \$530 for each of the 66 shops inspected. Shop com-

White pine	438	101	24	23.8	1,400	560	40	76.2
Unspecified	11,888	6,521	57	45.3	13,723	6,175	45	54.7
Total	2,674,900	951,010	36	30.	6,236,522	2,461,217	39	70.0

for the r ties, while many used by the steam roads were bought for 27c.

Table 6 gives the number and cost of ties purchased by electric roads in 1910, according to method by which made.

With electric roads 61.4% of the ties purchased were hewn, as contrasted with the steam roads, where 70% were hewn. Douglas fir constituted 50% of the sawn ties and cedar constituted 34%. Cedar made up 57% of the hewn ties, and Douglas fir 20.7%. The species which are chiefly used sawn are cedar, Douglas fir and oak. The species which are chiefly used hewn are hemlock, tamarack, cypress, spruce and jackpine. All the cypress and jackpine ties used were hewn.

The average price of hewn ties was 37c., or 2c. a tie less than was paid by steam roads. It is interesting to note that whereas with steam roads hewn ties cost 3c. a tie more than sawn ties, with electric roads sawn ties cost 9c. a tie more than hewn ties.

Imports from the United States of cross-ties in 1910 amounted to \$1,096,832. Exports in 1910 were 1,995,582 ties at a value of \$463,508. Of this total \$376,913 was to the U.S. The balance of imports over exports was \$633,324, which represents about 891,000 ties at the average price paid for ties in Canada in 1910.

PRESERVATION.—Two plants have been established for the chemical treatment of railway ties, one at Fort Frances, Ont., and the other near Winnipeg. It is stated that a plant will also be erect-

cipally used, because of its durability, but the supply of cedar is rapidly becoming exhausted. Unless preservative treatment of ties is introduced, the species of short life will have to be used untreated, which, on account of the necessary frequent renewal, will increase the cost of mileage maintenance. If

Total	116,771	54,088	46	88.6	185,769	69,313	37	61.4

treated ties were used, which would cost about 30c. extra per tie for creosoting and equipping with tie plates, the inferior species, which are very plentiful and cheap in Canada, could be used with economy. With such a treatment these woods would last at least 15 years, and if protected from wear would probably last much longer.

The lodgepole pine of the west would be greatly increased in usefulness by this treatment. This species is used chiefly for mining timbers and props.

mittees formed of the men themselves, render invaluable assistance, for it is by the care exercised by the individual workman that the results are largely obtained. Standing committees, the personnel of which is changed from time to time make various suggestions covering the improved construction and arrangement of the various tools and appliances around the shop, wherever such improvements would result in a greater safety to the workman without decreasing the efficiency of the machine.

The First Locomotive into Vancouver.

As illustrative of the rapid development of the locomotive during the last quarter of a century, an inspection of the three accompanying illustrations will prove interesting. The locomotive shown in figs. 1 and 3 is that used to haul into Vancouver on May 23, 1887, the first C.P.R. train from Montreal. Nearly a year previously, on July 4, 1886, the first C.P.R. train from Montreal to the Pacific Coast, reached Port Moody, on Burrard Inlet, which was the temporary ocean terminus. We are indebted to A. B. Calder, until recently General Agent, Passenger Department, C.P.R., Chicago, and now of Winnipeg, for the photograph, and to G. I. Evans, Mechanical Engineer, C.P.R. for the drawings of figs. 1 and 2.

Figs. 1 and 2 show more graphically the development of the locomotive during this past quarter of a century, both the drawings being to the same scale. Fig. 2 is one of the modern Pacific type locomotives now hauling passenger trains into Vancouver. The old 8-wheel or American type freight and passenger locomotive, fig. 1 is a C.P.R. class A6, with a 65% capacity, the new Pacific locomotives are of the C.P.R. class G2, with a 140% capacity. The present locomotive has a drawbar pull of 28,000 lbs., as against 13,000 lbs. of the older type of 24 years ago, the capacity being more than doubled.

The old locomotive, which is shown as fig. 3, on page 173, is still in active service, running out of Minnedosa, on the Manitoba Division, its number having been changed from 374 to 245.

The Economic Organization and Maintenance of the Freight Car Repair Yard at a Terminal Point.

By J. Thos. Warde.

The question of the proper maintaining of a repair plant where there are from 200 to 250 cars repaired daily, is a very serious one, and calls for careful

must be at least 16 ft. apart, alternate tracks, have a supply track of standard gauge and a third rail to form narrow gauge, and each end of yard should be well drained, and, if possible, equipped with sewer and water system, compressed air system, electric power and light, and the yard should also be as near shops, as possible.

I would recommend a central building under one roof, accessible from all

have air device for emptying of oil barrels, should contain waste bin, oil tanks for soaking and proper treatment of, and making of dope.

Paint room should have a galvanized-iron covered table for cleaning of stencils, rack for storing stencils, iron tanks for paint, oil, etc.

The store room should be fitted with drawers, pigeon-holes, racks, etc., for the proper storing of material and small supplies.

Fig. 1. Diagram of First Locomotive into Vancouver.

parts of the yard, consisting of the foreman's office, general office, time office, stores, carpenters' shop, paint shop, oil house, triple rack, blacksmith and machine shop, men's lunch room and lavatory, also lumber racks, material platforms and racks, and wheel tracks for b.o. and serviceable wheels. The advantage of one building lies in the fact of one heating, this can be very economically arranged for, by an old boiler and fed by the scrap wood, etc., thus overcoming to a great extent the danger of fire, on account of having stoves.

By having a drive-over about the centre of the yard and a standard gauge track, with a third rail making a narrow gauge track with turntables at intersections, you can connect all supply tracks. This can be used for handling wheels as well as other material, and also as a means of keeping yard clear of scrap, etc.

The fact of supplying a repair yard with a sufficient supply of necessary tools, quick lifting jacks, etc., and machinery should not be lost sight of, as (supposing yard is equipped and wired for electricity) individual electric motor power is not only economical, but desirable for the running of machinery. It will be found economy to install cut-off and rip saw, band saw, buzz planer,

The general office for use of assistant foreman, inspectors, clerks, etc., should have a private office for foreman in charge.

The efficiency of the organization depends on the executive and personal individuality of the foreman in charge. He should be a man of ability, an energetic nature and resourceful, his staff should average for the number of cars mentioned, six assistant foremen on a monthly salary, one inspector, four car oilers, 30 freight carpenters, 170 car repairers, 30 laborers, two painters, two assistant painters, one clerk, two boys, one storeman, one leading laborer, two checkers, one leading air cleaner and tester, eight cleaners and two testers, and one pipe man and helper.

The assistant foremen should oversee the work, under the general supervision of the foreman. These men should be taken from the rank and file, who have proved themselves adapted to the general overseeing of men and work; they should be practical and thoroughly conversant with the details of their work. The duty of the car inspector consists of inspecting all cars leaving yard, this man must be thoroughly conversant with the M.C.B. rules. Records of all foreign cars should be kept, re repairs. Repair and defect cards must

Fig. 2. Diagram of Modern Pacific Type Locomotive for Comparison with Early American Type Locomotive.

consideration, not only to handle the work expeditiously but also to handle it, in an economic manner.

The yard's location must be carefully selected. When possible, select a position where you can have 12 tracks of a capacity of 25 to 30 cars; tracks

little giant borers, drills, portable forges and riveting hammers for steel car repairs, with a capable man in charge and helpers, blacksmith's forges with electric power fans.

Oil house should have (underground, if possible) tanks. This point should

be made and affixed according to M.C.B. rules.

The leading air brake tester should have charge of air brake cleaner, testers and pipe-man, and should be responsible under the car inspector for all air brake work. All triples should be

cleaned and tested at the triple-rack, and a stock kept on hand for replacement. It would be policy, although not recommended for a yard of this size, to have a leading car oiler; his duty would be to see that all matter is properly made, and a supply always on hand; he should inspect all boxes, and advise the oiler as to the re-packing. I recommend, pull box and renew packing, journal boxes, that a proper system be organized, and boxes re-packed and stenciled, and in the event of six months elapsing, pull box and renew packing, or in other words, renew the packing every six months; packing removed to be treated, and the oil and waste reclaimed. Two car checkers should be able to take record of repairs made to cars, same should be reported to foreman and filed. Cars handled should be recorded by index system, and I recommend that a system be adopted to show, time placed, time o.k., and dates, this can be handled by one of the boys. Carpenters and car repairers should be placed with assistant foremen as necessary,

from the ranks of car repairers, as being familiar with the work, he can handle the position to advantage. The foreman should insist on a careful record being kept of all work supplies and general conditions as erecting work naturally falls to the repair yard. It is the foreman's duty to insist on maintaining an efficient staff, and the wrecking crew should not be less than 20 men taken from the car repairers. From these men selected, at least two of them should be first aid men holding certificates, and who have become conversant with the work. The men should be selected as required, according to nature of wreck; they should be under the charge of an assistant foreman, who should be held directly responsible for everything in connection with wrecking work, and the proper up-keep of the auxiliary equipment, and he and his crew should be available day or night. One man should be assigned to the duty of factotum of the dining and sleeping car, and be able to satisfy the inner-man; his duties would also include that of commissary,

such as light patching, draught timber and gear bolts, brakes, side doors or any light work that can be handled in one day, show class C or 3. Tracks should be designated by the symbol or figure and cars placed as marked.

The foreman should place with yard-master a switch list showing cars o.k. and location, listing cars he requires changed to other tracks to arrange his repairs, but the whole secret of success lies in co-operation with operating department, in providing a proper and efficient system of switching.

The foregoing paper was read before the Western Canada Railway Club in Winnipeg recently, the writer being chief clerk to the General Car Foreman, C.P.R.

In a brief discussion which followed A. McCowan stated that bad order cars had nothing to do with the freight congestion in Winnipeg, as far as the Canadian Northern Ry. was concerned.

Recent British Columbia Legislation.

The following acts affecting steam and electric railway interests were passed at the British Columbia Legislature's recent session:—

BRITISH COLUMBIA RAILWAY ACT.—Amending general act.

CANADIAN NORTHERN PACIFIC RY.—Making provision for extension of lines on the mainland and in Vancouver Island.

ESQUIMALT AND NANAIMO RY.—Confirming agreement as to exemption of lands from taxation, and providing for building an extension to Courtenay.

GRAND TRUNK PACIFIC RY.—Confirming agreement made between the G.T.P. Ry., the G.T.P. Development Co., the city of Prince Rupert, and the B.C. Government.

KETTLE VALLEY RY.—Ratifying agreement for building a line from near Merritt to the Fraser River; and confirming bylaw of Penticton municipality granting aid to the company.

PACIFIC GREAT EASTERN RY.—Act of incorporation. Confirming agreement with Foley, Welch and Stewart for building the line, and confirming agreement between Foley, Welch and Stewart and the G.T. Pacific Ry. for interchange of traffic, etc.

RAILWAY SUBSIDY LANDS.—Respecting repurchase by the crown of certain railway subsidy lands.

SOUTH EAST KOOTENAY RY.—Extending time for construction.

VANCOUVER INCORPORATION ACT.—Authorizing the city to provide a fund for the purchase of the British Columbia Electric Ry. on the expiry of the franchise if thought desirable.

Fig. 3. First Locomotive into Vancouver (See page 172).

but no assistant foreman should have more than 40 men. Painters should have well in hand the work of painting, etc. All sheathing, roofing, etc., should be painted ready for use. The advantage in this is manifold, you have always something to keep your painters busy, your sheathing for patching is ready for the stencil, and finally your car is o.k'd. in one day instead of three. Laborers should be under charge of a leading hand. His duties are manifold, from seeing that the scrap, etc., is gathered and placed in proper receptacles to seeing material placed at stores, also heavy material placed in a convenient position to handle. The storeman should have charge of supplies and be directly responsible for their up-keep. The foreman should furnish the general storekeeper every day a list of material supplied, attaching requisitions received and furnish list of requirements. The foreman should be in close touch with stores and be in a position to anticipate requirements, this would be of mutual benefit both to storekeeper and himself. For clerk, I prefer training a man

which is no small part of the wrecking equipment.

The auxiliary equipment should consist of a serviceable dining and sleeping car (an old coach makes a good car for this purpose), a tool car, heavy wrecking steam crane, block, tie and rail car, truck and wheel car. Tool car should be equipped with a first aid cabinet complete, with supplies and a modern equipment, quick lifting, traversing and other jacks, a plentiful supply of cables, tail ropes, chains and tools, and one man should be held responsible for their proper up-keep.

In arranging work for efficient handling on the repair tracks, a set of rules governing proper marking of cars by inspectors in the traffic yards would aid repair yard men, and the rules of marking of cars should be respected by switchmen in placing cars on the repair tracks. Defects should be classed, in A, B and C, or 1, 2 and 3 classes. Heavy work (three days) such as sills, roofs, etc., show A or 1 class, sill splices, ends, draught timbers, trucks, etc.; medium work (two days), as class B or 2; light,

The Montreal Tunnel Co. has been incorporated under the Dominion Companies Act, with a capital of \$15,000,000, and office in Montreal, to construct railway, tramway and steamship terminals, transportation, warehousing and storage facilities, tunnels and approaches, yards, stockyards, stores, buildings, "of every description, and tracks and equipment for the movement, storage or handling of any merchandise or traffic, passenger facilities and accommodation," together with grain elevators, vessels, and various other businesses. The provisional directors are: D. McDonald, L. H. Timmins, D. McMartin, J. Carson, P. Dubee, H. A. Ekers, L. J. S. Morin, K.C.; J. M. Fortier, T. Bastein, Montreal. (Mar., pg. 121.)

During Jan., nine employes were killed and 12 were injured in the course of their work in connection with railway construction in Canada. Of the fatal accidents, five were caused by explosions, three by falling material and one by a collision.

Orders by the Board of Railway Commissioners.

Beginning with June, 1904, we have published in each issue summaries of orders passed by the Board of Railway Commissioners, so that subscribers who have filed our paper have a continuous record of the Board's proceedings. No other paper has done this.

The dates given of orders, immediately following the numbers, are those on which the hearing took place, and not those on which the orders were issued. In many cases orders are not issued for a considerable time after the dates assigned to them.

16006. Feb. 17.—Authorizing C.N.O.R. to cross with its Montreal-Port Arthur line G.T.R. overhead in Nepean tp., mileage 14.2 from Ottawa.

16007. Feb. 17.—General order re air connections, etc., between snow ploughs and locomotives. (Published in full on another page.)

16008. Feb. 15.—Approving revised location of C.N.O.R. Toronto-Hamilton line through part of Toronto and York and Etobicoke tp., mileage 3.98 to 7.42 from Yonge St., Toronto, with leave to G.T.R. to apply to Board with regard to Belt Line property within 30 days, if so advised.

16009. Feb. 20.—Authorizing C.P.R. to take land for enlargement of Windsor St. passenger terminals. Montreal.

16010. Feb. 22.—Authorizing C.P.R. to open for traffic diversion of its line in Thunder Bay district, Ont., from mileage 92.24 to 93.42 and 93.92 to 95.12, and rescinding order 15932, Feb. 12, 1912.

16011, 16012. Feb. 23, 19.—Authorizing C.P.R. to use bridges 27.3, MacLeod subdivision, and 11.9 and 24.4, Souris subdivision.

16013. Feb. 19.—Authorizing C.P.R. to build spur for Britnell and Co. at Cooksville, Ont.

16014. Feb. 20.—Authorizing C.N.R. to build across five highways on its Prince Albert-Battleford line.

16015. Jan. 23.—Authorizing Nakusp and Slocan Ry. (C.P.R.) to build spur for 6 miles into Truro mineral claim, unsurveyed.

16016. Feb. 23.—Extending for 60 days time for installation of interlocking plant by Essex Terminal Ry., in Windsor, Ont., crossing to be used for construction purposes during extended period.

16017. Feb. 20.—Approving Klondike Mines Ry. standard freight mileage tariff for carload traffic C.R.C. 5.

16018. Feb. 20.—Ordering G.T.R. to file plans within two months for bridge where it crosses Perche drain, Sarnia tp., Ont.

16018. Feb. 22.—Ordering that plan approved by order 7200 and filed Apr. 27, 1909, re Toronto grade separation be amended by showing York St. opened to Lake St., and that subway full width of street be provided through elevated portion of tracks; question of compensation for land damages, etc., to be reserved.

16020. Feb. 24.—Authorizing James Bay and Eastern Ry. (C.N.R.) to cross road on lot 19, between r. 1 and 2, Dufferin tp., Que.

16021. Jan. 30.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to use bridge across road at mileage 56.4, Victoria county, Ont.

16022. Feb. 23.—Approving Napierville Jct. Ry. standard tariffs of maximum freight and passenger tolls C.R.C. 102.

16023. Feb. 17.—Authorizing G.T.P. Branch Lines Co. to build spur for Prince Albert Lumber Co., Prince Albert, Sask.

16024. Feb. 22.—Correcting errors in G.T.P. Branch Lines Co.'s Yorkton-Canora branch location plan.

16025. Feb. 23.—Relieving C.P.R. from fencing portions of its right of way, MacLeod subdivision.

16026. Feb. 23.—Authorizing C.P.R. to build spur for W. Milne and Sons, Shedden tp., Ont.

16027. Feb. 24.—Authorizing G.T.P. Branch Lines Co. to build its Cutknife branch across 11 highways in Saskatchewan.

16028. Feb. 20.—Approving standard freight and express tariff C.R.C. 6, for less than carload traffic.

16029. Feb. 26.—Appointing W. S. Senkler, senior judge Lanark county court, as arbitrator to assess damages to be awarded property owners injuriously affected by closing of streets, etc., by C.P.R. in Smiths Falls, Ont.

16030. Feb. 24.—Dismissing application of town of Dorval, Que., re G.T.R. early morning train into Montreal.

16031. Feb. 23.—Approving Napierville Jct. Ry. bylaw authorizing D. I. Roberts, General Manager, to issue tariffs of tolls.

16032. Feb. 24.—Dismissing application of city of Lachine, Que., for order directing G.T.R. to make Convent station the chief station there.

16033. Feb. 26.—Approving location of Dominion Atlantic Ry. North Mountain branch from Lakeville to Weston, 10 miles.

16034. Feb. 26.—Authorizing James Bay and Eastern (C.N.R.) to cross public road in Demeules tp., Que.

16035. Feb. 27.—Approving C.P.R. plans for transfer track with C.N.R. at Winnipeg.

16036. Feb. 24.—Authorizing G.T.R. to use bridge 45 at mileage 87.83, District 8, over C.P.R. and Scugog river, Ont.

16037. Feb. 27.—Authorizing M.C.R. to use drawbridge over Welland canal, just east of Welland station, Ont.

16038. Feb. 29.—Ordering C.N.O.R. to file plan within 30 days of overhead bridge, with clearance of 60 ft. over Metcalfe Road, Ottawa; city to pay cost in excess of that for 54 ft. bridge.

16039. Feb. 27.—Naming express collection and delivery limits for Fernie, B.C.

16040. Feb. 27.—Authorizing C.N.O.R. to cross public road between lots 6 and 7, con. B, Murray tp.

16041. Feb. 29.—Authorizing G.T.P.R. to build spur into Edmonton Portland Cement Co.'s premises.

16042. Feb. 29.—Authorizing town of Vegreville, Alta., to build Main St. across G.N.R.; company to move freight shed and coal house by Aug. 1; town to pay cost.

16043. Feb. 26.—Extending express collection and delivery limits for Lethbridge, Alta., rescinding order 15082, Sept. 8, 1911.

16044. Feb. 15.—Ordering C.P.R. to install home and distant signals with derails interlocked with swing portion of bridge over Trent canal at mileage 44, on Georgian Bay, and Seaboard Ry.

16045. Feb. 28.—Authorizing C.N.R. to cross with its Rossburn line 18 highways in Saskatchewan.

16046. Feb. 29.—Authorizing T.H. and B.R., G.T.R. and Hamilton Radial Ry. to operate trains over interlocker near Ottawa St., Hamilton, Ont.

16047. Feb. 29.—Amending order 15152, Oct. 12, 1911, re Coxwell Ave. subway, Toronto city to maintain subway so as not to impair safety of G.T.R.

16048. Feb. 26.—Dismissing application of Chambre de Commerce, Montreal, relative to delays in delivery of goods in cars, and that railway companies pay demurrage on cars arriving in yards not delivered within 24 hours.

16049, 16050. Mar. 1.—Authorizing C.N.O.R. to build bridges over Black Sturgeon river, mileage 59.3 and 78, east of Port Arthur.

16051. Mar. 1.—Authorizing Iberville municipality, Que., to build highway across Central Vermont Ry. to connect range 6 public road with Grande Ligne road.

16052. Mar. 1.—Amending order 14979, Sept. 19, 1911, re taking of B. J. Coghill and Co.'s land in Hochelaga ward, Montreal, by C.N.Q.R.

16053. Mar. 1.—Ordering that G.T.R. install gates to be operated from tower where it crosses Hope and Woodstock Sts., Tavistock, Ont., 20% to be paid from railway grade crossing fund, remainder by G.T.R.; 15% of maintenance and operation to be paid by Tavistock village.

16054. Mar. 1.—Dismissing application of J. M. Morin, K.C., for order to compel C.N.Q.R. to macadamize and keep in good repair highways and abutments of bridge between Bout de l'Île and Charlemagne, Que.

16055. Feb. 29.—Authorizing C.P.R. to build spur for Canadian Equipment and Supply Co., Calgary, Alta.

16056. Mar. 1.—Authorizing C.P.R. to grant special rate to McGill University mining students from Montreal to Rossland, Phoenix and Greenwood, B.C., at \$40 and return, and side trip, if desired, from Slocan Jct. to some point on Sandon branch at ¼ c. a mile each way, and providing that other parties desiring to travel for same purpose to B.C. or other mining district be granted equally favorable terms.

16057. Mar. 1.—Ordering that Kingston and Pembroke Ry. jointly with C.P.R. file within 30 days, tariff establishing a rate of 10 ¼ c. per 100 on ex-lake grain, in carloads, from Kingston to Montreal, including stop-over at Almonte for milling purposes.

16058. Feb. 13.—Authorizing G.T.P.R. to cross highway in St. Francois Xavier parish, and to divert highway, mileage 119 to 119.3, Winnipeg district.

16059. Mar. 4.—Disallowing C.P.R. rate of 80c. per 100 lbs. on lumber from Port Arthur and Fort William to Vancouver, and ordering C.P.R. within 30 days to substitute a rate of 55c. per 100 lbs. on lumber, including flooring, in carloads of 40,000 lbs. minimum.

16060. Jan. 12.—Authorizing C.N. Alberta Ry. to build across G.T.P.R. in s.e. ¼ sec.

31, tp. 53, r. 10, w. 5 m., interlocking plant to be installed.

16061. Mar. 2.—Amending express classification 2 by making certain changes in newspaper rates from Winnipeg to Calgary.

16062. Mar. 4.—Approving location of C.P.R. Wilkie Northwesterly branch, from mileage 0 to 12.86, and from mileage 26.85 to 32.15, and revised location from mileage 12.86 to 26.85.

16063. Mar. 1.—Authorizing C.P.R. to add 150 ft. to siding on lot 15, con. 1, Trafalgar tp., Ont.

16064. Mar. 1.—Authorizing municipality of Bridgeburg, Ont., to carry street over G.T.R. and M.C.R. by overhead bridge.

16065. Mar. 6.—Authorizing G.T.R. to rebuild swing bridge over Lachine canal, in Montreal.

16066. Mar. 6.—Exempting Vancouver, Victoria and Eastern Ry. from use of zinc covering over caps and intersections as required by order 11446, Aug. 2, 1910, where oil burning engines alone are used.

16067. Mar. 5.—Authorizing White Pass and Yukon Route to publish special tariffs for excursion business, etc., within less than statutory notice.

16068. Mar. 5.—Authorizing James Bay and Eastern Ry. (C.N.R.) to build bridge over Iroquois River, Ashuapmouchouan tp., Que.

16069. Mar. 5.—Approving plans for lowering pipe under M.C.R. in Wainfleet tp., Ont.

16070. Mar. 5.—Authorizing G.T.P.R. and C.N.R. to operate trains over interlocking plant in n.w. ¼ sec. 18, tp. 48, r. 25, w. 2 m., Sask., without coming to a stop.

16071 to 16074. Mar. 5, 6.—Authorizing C.P.R. to build spurs for city of Winnipeg; G. P. Sherwood and Co., Montreal; Stoneclough Quarry Co., near Coldwater, Ont.; and siding with spurs for St. Mary's Portland Cement Co., and rescinding orders 15667, Dec. 15, 1911, and 15969, Feb. 13, respecting the last named.

16075. Mar. 5.—Approving portion of C.P.R. Swift Current Southeasterly branch from mileage 40 to 45, and authorizing construction across three highways.

16076. Mar. 5.—Authorizing C.P.R. to build across highways from mileage 0 to 35.25, on its Boisvevain to Lauder branch, Man.

16077. Mar. 4.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to divert public road between cons. 7 and 8, Eldon tp., and to build across same at mileage 56.4 by overhead bridge, compensation to be paid J. McArthur for damage to property, and rescinding order 15987, in this connection.

16078. Mar. 7.—Authorizing C.N.R. to cross and divert public road on its Maryfield extension.

16079, 16080. Mar. 5.—Authorizing C.P.R. to build spurs for Sidney Brick and Tile Co., Sidney, Man., and Guelph Stove Co., Guelph, Ont.

16081. Mar. 5.—Approving location of C.N.O.R. Sudbury-Port Arthur line from mileage 2 at Current River, Port Arthur, to lot 5E, McGregor tp., at mileage 6.49.

16082. Mar. 7.—Approving revised location of G.T.P. Branch Lines Co. Regina-Boundary branch, mileage 84.22 to 91.13, Sask.

16083. Mar. 5.—Authorizing South Gower tp., Ont., to build highway across C.P.R.

16084. Mar. 7.—Approving revised location of G.T.P. Branch Lines Co. Regina-Boundary branch, mileage 17.02 to 84.22.

16085. Mar. 7.—Approving Central Ontario Ry. bylaw authorizing G. H. Shaw, Traffic Manager, C.N.R., to issue tariffs of tolls.

16086, 16087. Mar. 6.—Approving location of C.N.O.R. Montreal-Port Arthur line through Crerar, Dana, Janes and Davis tps., mileage 386 to 406 from Montreal, and through unsurveyed territory, Sudbury District, mileage 191.6 to 193.7.

16088. Mar. 7.—Authorizing C.P.R. to build spur for Chinook Coal Co., near Kipp, Alta.

16089. Mar. 8.—Ordering C.N.R. to cease from blocking lanes and streets in Brandon, Man., under penalty of \$50 a day, and that it plank the track before May 1.

16090. Mar. 8.—Amending conditions of carriage and directions to agents in Express Classification 2. This is given in full on another page.

16091. Mar. 7.—Authorizing South Ontario Pacific Ry. to operate connection of its Guelph Jct. to Hamilton line with T.H. and B.R. for construction purposes only until May 31.

16092. Mar. 7.—Authorizing Vancouver, Victoria and Eastern Ry. to open for traffic its line from Princeton to Coalmont, 13 miles.

16093. Mar. 6.—Authorizing C.P.R. to build spur for city of Winnipeg.

16094. Mar. 6.—Authorizing G.T.P. Branch Lines Co. to build spur for Yellowhead Pass Coal and Coke Co., on Alberta Coal branch.

16095. Mar. 7.—Authorizing C.N.O.R. to take portion of lot 9, Brokenfront concession, Trenton, for diversion, as approved by order 12480, Dec. 7, 1910.

16096. Mar. 6.—Authorizing Midland Ry. of

Manitoba (G.N.R.) and G.T.P.R. to operate trains over crossing in parish lot 55, St. Boniface, Man., pending completion of interlocker.

16097. Mar. 8.—Authorizing G.T.R. to build branch through Holmedale district, Brantford, Ont., and across hydraulic canal and Grand River to its Brantford and Tillsonburg branch. District 20, and to close streets and highways in the city, compensation to be paid A. J. Wilkes for land taken.

16098. Mar. 11.—Approving revised location of C.N.O.R. Montreal-Port Arthur line through Capreol tp., mileage 426.53 to 429.29 from Montreal.

16099. Mar. 9.—Substituting plan A for plan filed and approved by order 15280, Sept. 11, 1911, re C.N.R. spur on Hudson's Bay reserve, Edmonton, Alta.

16100. Mar. 9.—Authorizing Central Vermont Ry. to rebuild bridge over Little Montreuil River, between St. Lambert and Chambly, Que.

16101. Mar. 14.—Dismissing application of United Fruit Co., Berwick, N.S., re rate on apples to Winnipeg, Man.

16102. Mar. 4.—Authorizing C.P.R. to build subway at Decarie Ave., Montreal, to include diversion of Prudhomme Ave. by means of Western Ave., \$10,000 to be paid from railway grade crossing fund, and one-fifth of balance by the city.

16103. Mar. 7.—Ordering G.T.R. at once to arrange that train no. 7 stop at Paris, Ont., to let off passengers from Toronto and points east thereof.

16104, 16105. Mar. 11.—Authorizing C.P.R. to use bridges at mileage 0.5, 94.3, and 81.4, Windsor subdivision, and at mileage 40.3, 42.1, and 43.8, London subdivision.

16106. Mar. 11.—Authorizing C.N.O.R. to cross public road in Trafalgar tp.

16107. Mar. 11.—Approving Bay of Quinte Ry. bylaw authorizing G. H. Shaw, G.T.R., to prepare and issue tariffs of tolls.

16108. Mar. 7.—Ordering G.T.R. before May 1, to install electric bell at crossing west of Bainsville station. Lancaster tp., Ont., 20% to be paid from railway grade crossing fund.

16109, 16110. Mar. 12.—Authorizing C.P.R. to use bridges 8.2 and 9.2, Cranbrook subdivision, and bridges 80.5 and 62.8, Sirdar subdivision.

16111. Mar. 4.—Authorizing G.T.R. to take lands in York tp., Ont., in connection with its Toronto grade separation.

16112. Mar. 5.—Relieving G.T.R. from further protection of crossing of Richmond Road, Nepean tp., Ont.

16113, 16114. Mar. 4.—Approving standard station designs for Algoma Eastern Ry., and for Algoma Central and Hudson Bay Ry.

16115. Mar. 2.—Rescinding order 13818, May 31, 1911, and authorizing city of Toronto to maintain wires across C.P.R. and G.T.R., and over G.N.W. Telegraph Co.'s wires to pumping station at foot of John St.

16116. Mar. 13.—Disallowing Boston and Maine Rd. tariff 1300, re rates on granite from Beebe Jct., Que., to Montreal, Ottawa, Toronto and other points.

16117. Mar. 14.—Substituting plan A for plans filed for transfer tracks between C.P.R. and C.N.R. at Carberry, Man., approved by order 16035, Feb. 27.

16118, 16119. Mar. 13.—Relieving C.P.R. from erecting fences along right of way, Kimberly and Crowsnest subdivision.

16120. Mar. 13.—Approving revised location of C.P.R. Moose Jaw Southwesterly branch from mileage 0 to 35.59, and location from mileage 35.59 to 37.85.

16121. Mar. 14.—Amending order 16065, Mar. 6, re G.T.R. swing bridge over Lachine canal, Montreal.

16123. Mar. 14.—Authorizing C.P.R. to build three spurs for St. Mary's Portland Cement Co., Blanchard tp., Ont.

16124, 16125. Mar. 14.—Approving location of C.N.O.R. station grounds at Fallowfield and Merrivale, Nepean tp.

16126, 16127. Mar. 14.—Approving location of C.P.R. station at Drake, Sask., and plan of station at Dysart, Ont.

16128. Mar. 15.—Relieving C.P.R. from erecting fences on its Cranbrook subdivision, B.C.

16129. Mar. 15.—Authorizing G.T.R. to build temporary bridge across Beauharnois canal, at milepost 48.98, District 13, Ottawa Division.

16130. Mar. 14.—Relieving G.T.R. from further protection of fourth crossing east of London city limits, Ont.

16131. Mar. 13.—Ordering G.N.R. to erect fences from milepost 63 to 77, by June 1, under penalty of \$10 a day.

16132. Mar. 15.—Authorizing Pere Marquette Rd. to issue transportation to H. G. Shufelt, Ice Car Inspector, Dominion Department of Agriculture.

16133. Mar. 15.—Authorizing British Columbia Electric Ry. to cross Esquimalt and Nanaimo Ry., near Russell station, B.C., half interlocking plant to be installed.

16134. Mar. 15.—Approving C.P.R. plan of

interlocking and derailing apparatus at Batiscan River bridge, Quebec subdivision.

16135. Mar. 14.—Approving changes and alterations in C.P.R. station at Dufferin Bridge, Ottawa, Ont.

16136. Mar. 15.—Relieving C.P.R. from erecting fences on its Sirdar subdivision, B.C.

16137. Mar. 15.—Authorizing Georgian Bay and Seaboard Ry. (C.P.R.) to cross two highways at mileage 82.89 and 82.02.

16138. Mar. 18.—Authorizing C.P.R. to rebuild bridge 66.6, Souris subdivision.

16139, 16140. Mar. 18.—Authorizing C.P.R. to build spurs across Montcalm St., St. Boniface, Man., and for city of Medicine Hat, Alta.

16141. Mar. 18.—Authorizing C.P.R. to file new location plan for its Molsons' St. Boniface branch, showing width of land coinciding with arbitration notice filed by it.

16142. Mar. 16.—Approving revised location of C.N.R. Swift Current Branch, mileage 78.29 to 124.96, Sask.

16143. Mar. 16.—Relieving G.T.R. from further protection of second highway north of Huntsville, Ont.

16144. Mar. 19.—Extending to April 1, time for installation of interlocker at Nipissing Jct., Ont., by G.T.R. crossing C.P.R. and connecting with T. and N.O.R.

16145. Mar. 20.—Ordering that York tp., Ont., shall build and maintain bridge over G.T.R. belt line east of Yonge St., Toronto.

16146. Mar. 19.—Authorizing C.P.R. to build bridge 85.2, Portal subdivision, Sask.

16147. Mar. 18.—Naming express delivery and collection limits for Ottawa, Ont.

16148. Mar. 20.—Substituting plan for plan filed showing diversion C.N.O.R. approved by order 13952, June 14, 1911.

16149, 16150. Mar. 20.—Authorizing G.T.R. to build sidings for J. Goodwillie and Sons, Welland, Ont., and J. T. Watson, York tp., Ont.

16151. Mar. 20.—Authorizing town of Claresholm, Alta., to extend Fourth Ave. across Calgary and Edmonton Ry.

The C.P.R.'s New Line from Glen Tay to Agincourt, Ont.

We are officially advised that the C.P.R. has let a contract to Deeks and Hinds, Toronto, for the construction of a line from Glen Tay to Agincourt, Ont., 184 miles. The contract includes grading, concrete work, and tracklaying, but not buildings and steel structures. The work will be gone on with at once, and the contract calls for its completion within two years.

The Dominion Parliament in 1904 incorporated the Campbellford, Lake Ontario and Western Ry. Co. to build a railway from the C.P.R. Montreal-Toronto line between Blairton and Ivanhoe, southwesterly to Cobourg, and thence westerly rejoining the Montreal-Toronto line between Locust Hill and Leaside Jct. The object in view was the provision of a line giving a more close connection with towns on the Lake Ontario shore than the G.T.R. gives, and to provide a competing line. The provisional directors included:—J. B. Ferris, Campbellford; H. J. Walker, Warkworth; G. F. Ferris, Cobourg; H. Barrett, Port Hope; J. J. Mason, Bowmanville; F. L. Fowke, Oshawa, and E. R. Blow, Whitby, all of which places it was proposed to reach by the new line. Public meetings were held throughout the district interested, preliminary surveys were made, and the C.P.R. was finally induced to take up the project. Various routes were gone over with a view of securing a suitable location, and the company's powers were extended from time to time, and in 1911 Parliament authorized the company to build the projected line from Glen Tay to near Agincourt. This decision was protested against by several of the towns which the original line would have served, with the result that while the new powers were given, the company retains the right to build through Campbellford, etc.

The surveys on the new route were completed during 1911, and the final plans were filed, after approval, Jan. 10, 1912. The new line starts from the present Montreal-Toronto line, at Glen-

tay, 16 miles westerly from Smiths Falls, at the point to which a double line has been laid from Montreal. The route located makes straight for Belleville, 75 miles. The Kingston and Pembroke Ry. is crossed at Parham, and it is proposed, according to press reports, to build a branch from near Belleville, to the cement works at Point Ann. From Belleville the line keeps along the shore line south of the Canadian Northern Ontario Ry.'s Toronto-Ottawa line, passes through Brighton, Colborne and Grafton, and joins up with the C., L.O. and W. Ry. location, which was previously approved by the Government. This shows a route along the shore line passing through or near Cobourg, Port Hope, Newtonville, Newcastle, Bowmanville, Oshawa, and thence keeping midway between the G.T.R. and the Canadian Northern Ontario Ry. to a junction with the present line at Agincourt, eight miles east of Leaside Jct. The proposed line is to be a single track one, constructed to main line standard, and having a ruling gradient of 0.4%.

Sir Thos. G. Shaughnessy is reported as having stated in Toronto, Mar. 8, that the question of whether a car ferry service across Lake Ontario would be operated in connection with the line, had not been considered.

New Brunswick Coal and Railway Co.

Following are extracts from the Commissioners' report for the year ended Oct. 31, 1911, which was presented to the New Brunswick Legislature recently:—

"We made reference in last year's report to the unsatisfactory progress being made by this company. We regret to say that there has been no improvement. For the whole year the total shipments have been only 2,605 tons, and for the past three months not a car has been shipped. To all appearances the coal mine has been abandoned. The Government has a security on the railway and fastenings as well as a deed of the right of way, so that no other creditors can legally claim them.

"The total cost of the road to Oct. 31, 1910, was \$2,003,386.48; the amount expended for rolling stock, construction, bridges, ballasting, etc., during 1911 was \$32,648.64; total, \$2,036,035.12. The gross earnings for 1911 were \$58,776.96, against \$60,009.82, a decrease of 1,232.86. There was a falling off in freight traffic of \$1,597, and in passenger traffic of \$2,236; mails and express receipts declining by \$85. These decreases are largely attributed to the interruption of traffic due to the fall of the steel bridge over the Washademoak River at Cody's, caused by the burning of one of the wooden piers. The operating expenses for the year were \$78,652.96, against \$76,435.99 for 1910. The increase of \$8,146 in the cost of maintenance of way over the previous year was largely due to the following items—rebuilding engine house at Minto, destroyed by fire, \$700 over \$2,000 received from insurance, replacing bridge at Cody's \$3,127, increase in trackmen's wages \$1,781.55, and against this there was a decrease in transportation expenses of \$2,073. The gross earnings were \$58,776.96, operating expenses \$78,652.98, deficit \$19,876.02. The New Brunswick Premier, in submitting the report, stated that 6,286 ft. of sidings were provided during the year, and 28,068 new ties placed in the track, in addition to an expenditure on ballasting and on the Salmon Harbor branch.

The Central Vermont Ry. has equipped its New London Division with a telephone train dispatching system, this being the second division so equipped. The work was carried out under M. Magiff, Superintendent of Telegraphs, C.V.R., St. Albans, Vt.

Canadian Pacific Railway Construction, Betterments, Etc.

Access to Boston, Mass.—An order was reported in the Massachusetts House of Representatives, Mar. 16, inviting the C.P.R. to extend its lines through the state to Boston.

St. John, N.B.—The New Brunswick Legislature has under consideration an act confirming an agreement between the Dominion Government, the city of St. John and the C.P.R. in connection with the carrying out of improvements in the St. John harbor. In order to enable these to be effected the company surrenders to the city the 1,600 ft. strip conveyed to it in 1893, and other adjoining lands, and the city conveys these to the Dominion Government. In consideration of the transfer of these lands by the company the city agrees to grant the company certain other lands for 990 years at a rental of \$1 a year. The company agrees to fill in the lands, and to utilize them as railway yards, or otherwise as may be required in connection with the extension of its facilities. The company also agrees, not later than May 1, 1918, to alter the location of its tracks on Germain St. on the westerly side of the harbor so that no tracks shall be located on the most westerly 20 ft. between Ludlow and Victoria Streets, and that it will provide a 20 ft. strip for use as a highway between Victoria and Union Streets. The city agrees that the taxes to be levied on the lands and improvements shall not exceed \$100 a year, except in regard to any portion which may not be used as provided for by chap. 46 of 33 Vict. The Dominion Government agrees to build wharves and docks on the lands granted to it.

Northern Colonization Ry.—The Dominion Parliament has authorized the company to continue the "construction of its line from Labelle, Que., westerly to Rapide de L'Orignal (now called Mont Laurier), and on to Lake Temiscamingue in Pontiac county," and has extended the time for construction. The words within quotation marks are taken from the act. The company's line was extended some years ago to Nominigoue, and it was proposed to extend it to Maniwaki, the terminus of the Ottawa, Northern and Western Ry. line along the Gatineau River Valley. Maniwaki is in Pontiac county, and there would be a straight route westerly to Ville Marie. The building of such a line, which is authorized by the Dominion Parliament this session, would provide a shorter and more direct line from both Montreal and Ottawa to Ville Marie, than the one also advocated via Mattawa and Kipawa.

Ottawa, Northern and Western Ry.—The Dominion Parliament has extended the time for the construction of the lines and branches authorized by chap. 84 of the statutes of 1899, and chap. 72 of the statutes of 1900.

Kipawa to Ville Marie, Que.—A deputation representing Pontiac county waited on the Quebec Government, Mar. 6, to urge the extension of the C.P.R. line now terminating at Kipawa to Ville Marie. The Premier stated that he had been advised by Sir Thos. G. Shaughnessy that the C.P.R. proposes to start the construction of a line to the north of Lake Timiskaming next spring. The Government proposes to set aside 4,000 acres of land a mile in aid of the railway. The construction of a line to the point named is necessary, and if the C.P.R. does not build it the Government will.

The C.P.R. has held a charter for the building of a line from Kipawa to Ville Marie for a number of years, but nothing has been done, and press reports state that if the C.P.R. reaches the lake it will be by means of the Northern Colonization Ry.

South Ontario Pacific Ry.—We are officially advised that track has been laid from Guelph Jct., Ont., for 7.56 miles. About seven miles of grading beyond the end of track is practically ready for the steel, and work is in progress to mileage 16.28, which is the point of connection with the Toronto, Hamilton and Buffalo Ry. at Hamilton. The principal work to be done, outside the track laying on the seven miles referred to, is trimming and some ditching. It is expected to have the line opened for traffic by June 1.

The Dominion Parliament has extended the time for the building of the lines authorized.

The Board of Railway Commissioners has authorized the operation of trains for construction purposes only, over the connection with the Toronto, Hamilton and Buffalo Ry. at Hamilton.

Ingersoll, Ont.—Press reports state that a \$30,000 bridge is to be erected, and other improvements carried out at Ingersoll, Ont.

Entrance to Stratford.—The railway committee of the Stratford, Ont., city council, was advised, Feb. 29, to prepare the agreement and bylaw granting a right of way through the city on the south side of the river.

Guelph and Goderich Ry.—C.P.R. divisional officers visited Goderich, Ont., Feb. 28, and as a result it is said that plans are being prepared for the laying of new sidings, and the building of a 500 ft. freight shed on the pier.

London Improvements.—Plans were submitted to the London, Ont., board of works, Mar. 8, for improvements at Pall Mall. This is a local improvement, and is only indirectly connected with the larger proposals which have been under discussion for a considerable time.

Press reports state that in connection with the general improvement plans a large hotel will be built in the city, but we are officially advised that the first intimation the company had of the matter was the reports in the daily papers.

Collingwood Southern Ry.—At a meeting of the Collingwood, Ont., town council held recently to consider the proposition for the building of a line from Baxter into Collingwood by the C.P.R., it was agreed to grant certain properties to the company, a free right of way 50 ft. wide across any corporation property; to close up certain streets, and, subject to the rights of the G.T.R., to lay a single track on Walnut St.

The company's surveying staff completed their work Mar. 8, and local reports state that right of way agents have commenced acquiring the land required between Baxter and the Collingwood boundary.

Thunder Bay District Division.—The Board of Railway Commissioners has authorized the opening for traffic of the diversion of line mileage 92.24 to 93.42 and 93.92 to 95.12 in Thunder Bay district, Ont., and has rescinded a previous order dated Feb. 12.

Fort William Elevators.—Superintendent Armstrong is reported as stating that elevator D at Fort William, Ont., is to be enlarged by the addition of 2,000,000 bush. storage capacity, and that a large "hospital" elevator will be built.

Transfer Track at Winnipeg.—The Board of Railway Commissioners has approved plans for the building by the C.P.R. of a transfer track with the Canadian Northern Ry. at Winnipeg.

Red River Bridge.—Press reports state that a contract has been let to the Foundations Co., Montreal, for putting in the substructure of a new bridge across the Red River at Winnipeg, so as to enable two additional lines to be carried.

Manitoba Division Buildings.—Tenders are under consideration for the erection of locomotive house additions at Bran-

don and Arcola, for a new station building at Bredenbury, and for extensions to the freight office at Winnipeg.

Gimli Branch Extension.—It is reported that owing to representations made by the Manitoba Government, it has been decided to proceed at an early date with the extension of the Gimli branch to Riverton, on the Icelandic River, Man.

Brandon Yards.—J. A. McGregor, Superintendent, is reported as having stated that the improvements to be effected in Brandon, Man., include the doubling of the capacity of the present terminals, so as to enable the yard to be operated as a double one, and the rearrangement of tracks so that trains can enter and leave without interference. Six stalls are to be added to the locomotive house, and better provision is to be made for the repairing of cars.

Virden-McAuley Branch.—The Board of Railway Commissioners has approved location plans for the extension of this branch line from mileage 14 to 36.27.

Saskatoon.—The Saskatchewan Legislature has confirmed an agreement made Jan. 27, 1911, between the company and the city of Saskatoon. The city agrees to close up certain streets and hand over the area of the same to the C.P.R., which company agrees to pay \$3,100 in cash and release the city from the payment of the balance owing on account of strengthening the bridge over the South Saskatchewan River. Provision is made for the opening up of certain new streets at some future time and their being carried across the railway.

Regina-Pasqua Second Track.—We are officially advised that a contract has been let to W. A. Dutton, Winnipeg, for the grading for a second track from Regina to Pasqua, Sask., 34.9 miles, and from Caron to Chaplin, Sask., 37.8 miles.

Swift Current Northwesterly.—Track has been laid to Cabri, Sask., on the branch northwesterly from Swift Current, Sask., and grading has been carried for some miles beyond Cabri. We are officially advised that a contract has been let to W. A. Dutton, Winnipeg, for the grading of an additional 80 miles.

Saskatchewan Division Buildings.—Tenders are under consideration for the building of a station at Weyburn, Sask.

Press reports state that the contract for an express building and two freight sheds at Saskatoon has been let to J. Simmons, Winnipeg, and that for a six-stall locomotive house and an express building at Swift Current to J. C. McDiarmid and Co., Winnipeg.

Weyburn-Lethbridge Branch.—The present end of track is at Viceroy, Sask., and we are officially advised that a contract has been let to Foley, Welch and Stewart for the construction of an extension for 100 miles westerly.

Construction is also to be started from the western end, and a contract has been let to J. Timothy, Edmonton, Alta., for building 25 miles from Stirling. A station on the Alberta Ry. and Irrigation Co.'s line just south of Lethbridge. The contractor's grading outfit reached Stirling Mar. 1, and work is reported to have been started.

Swift Current Southeasterly.—The Board of Railway Commissioners has authorized the opening for traffic of the branch line from Swift Current, Sask., southeasterly from mileage 40 to 45.

Wilkie Northwesterly.—The Board of Railway Commissioners has approved of location plans of the branch from Wilkie, Sask., northwesterly, sometimes referred to as the Manitoba Lake branch, from mileage 0 to 12.86, revised location plans from mileage 12.86 to 26.85, and location plans from mileage 26.85 to 32.15.

Plans have been filed in the Lands Titles office, Regina, Sask., and in the local office at Battleford, Sask., showing the route of the line starting from

Wilkie, northwesterly for 41 miles. Press reports state that surveys are being extended in the direction of Fort McMurray on the Athabasca River.

Kerrobert Northwesterly.—The Board of Railway Commissioners has approved of location plans for the branch line from Kerrobert, Sask., northeasterly, from mileage 0 to 20.2.

Suffield Southwesterly.—A contract has been let to J. G. Hargrave and Co., Ltd., Winnipeg, for the grading of a branch from Suffield, Sask., southwesterly for 30 miles into the southwest Alberta irrigated land section. This work will necessitate the handling of approximately 700,000 cubic yards of earth. The material will be free to handle; it is all prairie fill and will require no heavy machinery. A portion of the grade runs along about 3 ft. above the level and makes good shell work; the balance is good machine work. Work will be started as soon as weather conditions permit. Some part of the work, we are advised, will be sublet.

Bassano Northerly.—We are advised that on the line northerly from Bassano, Alta., the contractors, J. G. Hargrave and Co., Ltd., have some grading work to complete, and that as soon as this is done the entire construction crew and outfit will be moved to Suffield to start

building of the C.P.R. hotel at Calgary, Alta. The contract is for the superstructure, the excavation and the foundations having been completed when the extension to the station was built.

Alberta Central Ry.—We are officially advised that it is intended to complete building the section of this projected railway from Red Deer to Rocky Mountain House, Alta., this year. It has not been decided when construction will be proceeded with.

Press reports from Red Deer, Mar. 10, state that the building of the superstructure of the bridge across the Saskatchewan River at Rocky Mountain House, Alta., will be started as soon as the material can be delivered. Several carloads of cement are being transferred from Red Deer to the site. The grading is nearly completed, and it is expected that track will be laid to Rocky Mountain House this season. The C.P.R. yards at Red Deer are being enlarged in view of the increased traffic which the opening of the new line will bring in.

Electrification of Lines.—Local press reports state that tenders have been asked for the electrification of the line from Castlegar Jct. to Rossland, B.C., and that A. H. Armstrong of the General Electric Co., Schenectady, N.Y., and

Recent Dominion Legislation.

The following acts affecting transportation interests were assented to at Ottawa, Mar. 12:—

ALBERTA ELECTRIC RY.—Changing name to Alberta Interurban Ry., and authorizing organization upon certain conditions.

ALBERTA RY. AND IRRIGATION Co.—Defining powers as to issue of securities.

ALGOMA EASTERN RY.—Extending time for construction of certain lines.

BARCELONA TRACTION, LIGHT AND POWER Co.—Incorporation.

BARCELONA TRACTION, LIGHT AND POWER Co.—Respecting company's powers.

CALGARY AND FERNIE RY.—Extending time for construction.

CANADIAN NORTHERN ONTARIO RY.—Extending time for construction, and authorizing building of additional lines.

CANADIAN NORTHERN QUEBEC RY.—Extending time for construction and authorizing building of additional lines.

CAP DE LA MADELEINE RY.—Declaring line to be for the general advantage of Canada, and authorizing amalgamation with C.P.R.

COLLINGWOOD SHIPBUILDING Co.—Authorizing payment of subsidy for building drydock at Collingwood, Ont.

Canadian Pacific Railway's Station at Calgary, Alta.

work on the 30-mile branch southwesterly from that point.

Calgary Shops.—In the very full description of the new shops which was published in our Feb. issue it was stated that the contract had been let to Westinghouse, Church, Kerr and Co. We have since been advised that they have been retained by the C.P.R. both as engineers and constructors. The work will also include the design and installation of the service equipment in the various buildings, including travelling and jib cranes, wiring systems for shop and yard lighting and power, air and steam piping systems for power and heating purposes, water supply for drinking and fire protection, plumbing and toilet facilities, drainage system, transfer tables and pits, coal and ash-handling equipment, necessary switchboard and transformer sub-stations. J. G. Sullivan, Chief Engineer, Western Lines, is in charge of the work.

Maharg to Calgary Second Track.—We are officially advised that it is probable that the second track to be built from Maharg, the site of the new shops, 4.5 miles east of Calgary station, to about one mile west of Calgary station, will be done by the company's own forces.

Calgary Hotel.—Press reports state that a contract has been let to the P. Lyall and Sons Construction Co. for the

H. D. Bayne, of the Canadian General Electric Co., Toronto, visited Rossland, Mar. 4, in connection with tendering on the work.

Hammond to Vancouver Second Track.—We are officially advised that a contract for this work has been let to Grant, Smith and Co., general contractors, Seattle, Wash.

Coquitlam Yards.—In connection with the laying out of the new yards at Coquitlam, B.C., it is reported that construction will be started at an early date on a two-mile spur line to serve industrial sites along the Pitt River. The contractors for clearing the yards site—M. P. Cotton Co.—expect to have the work completed by April 30. Grading is in progress for laying tracks on to the site for the purpose of facilitating building operations. The first building put up will be a 20-stall roundhouse, the site for which has been selected, and tests for foundation purposes are being made.

Tunnel in Vancouver.—J. Osborne, General Superintendent, had a conference with the Vancouver city council, Feb. 27, relative to the construction of a tunnel to connect the local yards on False Creek, with the terminals on the inlet. The tunnel would be 4,000 ft. long and would allow of the elimination of a number of level crossings. (Mar., pg. 127.)

DOMINION ATLANTIC RY.—Extending time for building North Mountain branch.

ERIE, LONDON AND TILSONBURG RY.—Extending time for construction.

HAMILTON, WATERLOO AND GUELPH RY.—Increasing capital stock and extending time for construction.

HIGH RIVER, SASKATCHEWAN AND HUDSON Bay RY.—Incorporation.

INTERPROVINCIAL AND JAMES BAY RY.—Extending time for construction.

KOOTENAY AND ALBERTA RY.—Extending time for construction.

MONTREAL HARBOR COMMISSIONERS.—Authorizing further advances for harbor improvements.

NATIONAL TRANSCONTINENTAL RAILWAY.—Extending time for building Western division, and authorizing one commissioner instead of four.

NORTHERN COLONIZATION RY.—Extending time for construction.

NORTHERN TERRITORIAL RY.—Incorporation.

OTTAWA, NORTHERN AND WESTERN RY.—Extending time for construction.

PACIFIC AND ATLANTIC RY.—Extending time for construction.

SOUTH ONTARIO PACIFIC RY.—Extending time for construction.

VANCOUVER ISLAND AND EASTERN RY.—Extending time for construction.

WEST ONTARIO PACIFIC RY.—Extending time for construction.

Canadian Northern Ry. Construction Betterments Etc.

James Bay and Eastern Ry.—The Board of Railway Commissioners has approved locations plans for the line through Demeules tp., Que.

Canadian Northern Quebec Ry.—The Dominion Parliament has extended the time for the construction of the lines authorized by paragraphs c, e and f, sec. 3, chap. 73, of the statutes of 1907; the lines of the Quebec, New Brunswick and Nova Scotia Ry. authorized by sec. 7, chap. 178 of the statutes of 1903; the lines of the Great Northern Ry. authorized by sec. 1, chap. 104 of the statutes of 1906, and the lines of the Chateauguay and Northern Ry., authorized by sec. 2, chap. 75 of the Quebec statutes of 1899. All these lines are at present partially constructed. The company is also authorized to enter into agreements with the Canadian Northern Montreal Tunnel and Terminal Co.

Engineers are reported to be making surveys for a line from St. Eustache to St. Jerome, Que., one of the lines for the construction of which an extension of time has been obtained.

Canadian Northern Montreal Tunnel and Terminal Co.—The plans for the projected tunnel under Mount Royal, the passenger and freight terminals in Montreal, and the overhead lines to the river front were laid before the board of control, Feb. 26, and are still under discussion.

The Dominion Parliament passed the bill incorporating a company for the purpose of building the tunnel and terminals, Mar. 15.

Canadian Northern Ontario Ry.—The Dominion Parliament has passed an act extending the time for the construction of the lines authorized by sec. 3, chap. 110, of the statutes of 1905; the uncompleted portion of the line authorized by sec. 3, chap. 50, of the statutes of 1895; repealing subsection one and par. b of subsection 2, sec. 7, chap. 72, of the statutes of 1907; authorizing the construction of a line from between Port Arthur and Sudbury near Long Lake to the National Transcontinental Railway east of Lake Nipigon, and a line from Chisholm tp. to the Central-Ontario Ry. between Bancroft and Whitney; fixing the amount of securities to be issued under sec. 3, chap. 57, of the statutes of 1911 at \$40,000 a mile to be issued in proportion to the length of line constructed or under contract, and authorizing entering into agreements with the Canadian Northern Montreal Tunnel and Terminal Co. and the Toronto Eastern Ry.

The line under construction from Toronto to Ottawa, which has been in operation for some time as far as Trenton, was reported completed as far as Deseronto, Feb. 29. At this point connection is made with the Bay of Quinte Ry. and trains will run over it as far as Sydenham, whence the line is under contract to Ottawa. Some betterment, including a couple of cut offs, have been done on the B. of Q. Ry. in order to provide for heavier traffic. A freight service is being operated from Toronto to Sydenham, but it is not expected that a passenger service will be put on until the summer.

The plans for the extension of the line from Toronto via Hamilton to Buffalo, and westerly from somewhere near Hamilton to Windsor or Sarnia, or both, under the Toronto, Niagara and Western Ry. charter, have formed the subject of considerable discussion for some time past. In Hamilton, the Niagara peninsula, Brantford, London, St. Thomas, and other western Ontario towns. The question of the entrance into Hamilton is the most important of the points involved, and this has

been discussed with the city officials and the city council, but no definite approval of the plans has yet been given by the city council. Sir Wm. Mackenzie is reported as stating that no line had been located west of Brantford, and that what would be done beyond that point would be considered in the future, but, he added, "it is getting to be the very near future now."

Montreal-Ottawa-Port Arthur Line.—The Minister of Railways, replying to questions in the House of Commons, Mar. 4, said the Dominion Government has not guaranteed the bonds of the C.N.R. or of any of the lines connected with it, which are a charge upon the terminals at Montreal or Winnipeg. The moneys realized from the sale of the securities of the Canadian Northern Ontario Co.'s railway, guaranteed by the Dominion under chap. 6 of the statutes of 1911, are being applied in aid of the construction of a line from Montreal to Port Arthur, as provided by the act and the deed of trust made thereunder. Such sums only are paid out of these moneys as the Chief Engineer of the Department of Railways certifies as justified having regard to the proportion of work done as compared with the work of construction of the whole line.

In connection with the plans for the entrance of the company's lines into the centre of Ottawa, the Board of Railway Commissioners has directed the company to build a bridge over Metcalfe road, having a clearance of 60 ft., the city to pay cost in excess of that of a 54 ft. bridge.

On Oct. 13, 1908, the Minister of Railways approved a route plan for a line from Ottawa to Key Harbor, Ont. The route plans of the Ottawa-Port Arthur section of the Montreal-Port Arthur line, which are now being approved in short sections by the Minister, follow the route of the line approved in 1908 as far as Chisholm tp., and then proceed northerly crossing the C.P.R. transcontinental line at Nipissing Jct., and passing through North Bay, join the C.N.O.R. Toronto-Sudbury, etc., line just north of Capreol, Ont. The Board of Railway Commissioners has approved of revised location plans for the line through Crerar, Dana, James and Davis townships, mileage 386 to 406 from Montreal; through Capreol tp., mileage 426.53 to 429.29 from Montreal; through unsurveyed territory in Sudbury district, mileage 191.6 to 193.7, from Sudbury Jct.; and from Current River, Port Arthur, mileage 2 to mileage 6.49. W. H. Grant, Manager of Construction, recently completed a trip of inspection over the eastern half of the line, and is reported as having stated in an interview that work had been gone on with during the winter at different points and that by July it was expected that 10,000 men would be at work. Unless it was impossible to get a sufficient number of men on, the line would be completed by the end of 1913, by which time it was also expected that the extension from Edmonton to the Pacific coast at Port Mann and Vancouver would be completed.

Duluth, Winnipeg and Pacific Ry.—We are officially advised that the company does not contemplate building coal docks and grain elevators at Duluth, Minn., in the immediate future, as stated in recent press reports.

Canadian Northern Ry.—Preparations are being made in Port Arthur, Ont., for starting work on a new steel dock, to be built alongside the present one, at a cost of \$30,000. It is stated that the dock is to be completed in three months. The contract for its erection has been let to the Barnett and McQueen Co. It is also reported that the Barnett and McQueen Co. will build during the present season a large addition to the company's grain elevators at Port Arthur.

The betterments to be done on the line between Port Arthur and Winnipeg

include the completion of the revision work at Rainy Lake, which has been in progress for some time, and the replacing of a number of Howe truss spans with steel structures on concrete piers and abutments. The Rainy Lake revision work was fully described in our issue of July, 1911, page 621. A contract has been let to S. Brown for the substructure of a double track bridge across the Seine River near Winnipeg, and work has already been started.

A new freight yard will be laid out on the east side of St. Boniface, about 2.5 miles from Winnipeg. The first section built will have a capacity of 700 cars, but the area of land secured by the company provides room for the laying of 100 miles of track.

Plans have been filed with the Board of Railway Commissioners for the building of a new bridge at the foot of Bell Ave., Winnipeg, for freight tracks.

The construction programme for the year includes the completion of the line started last year from near Winnipeg to Winnipeg Lake. This is an extension of the Bird's Hill branch, which was started in July last year under the Winnipeg and Northern Ry. charter, the mileage for which T. Edwards had the contract, is to be finished this year, and a further mileage to Lake Winnipeg is to be put under contract, and finished this season. The present objective point of this line is Port Alexander.

The betterment work to be undertaken this year on the main line west of Winnipeg includes the increase and improvement of terminal facilities generally, wherever required, and the re-laying of the track between Portage la Prairie and Grand View, Man., 151 miles, with 80 lbs. rails instead of the present 60 lbs. ones.

We are officially advised that engineers are locating a line from Portage la Prairie towards Morris, and thence towards Stuartburn, Man. The object of this line would be to enable traffic to be carried from the lines west of Portage la Prairie to a connection with the main line east of Winnipeg, without passing through that city, and so relieve the congestion there.

A new freight terminal is being laid out in Regina, Sask., covering the block bounded by Angus and Albert Streets, and Eighth and Dewdney Streets. A freight shed 255½ ft. by 41 ft. is to be built along Albert St. About 30 ft. of the length of the shed will be used as customs offices and bonded rooms. At the Dewdney St. end of the shed will be a 2-storey and basement concrete and brick office building 41 ft square. There will be four tracks in front of the shed. On the Angus St. side of the yard will be a loading platform and three sets of tracks with a 10-ton transfer crane having a 32-ft. span.
